FREE MILK FOR FRANCE

ALEX KOLBE, NEW YORK

"FREE Milk for France" is the slogan of a committee organized by two prominent women in New York City, with headquarters at 675 Fifth Avenue. A ton of dry milk, which is equivalent to 8,400 quarts in liquid form, is the daily need in France for wounded soldiers, and for our own boys who are among them, dying babies, and tuberculosis sufferers.

A huge milk can stands in front of the headquarters, with a slit in its top, through which may be dropped contributions for the committee's fund. By the side of the can a big sign reads: "Give of the Milk of Human Kindness, for France is Famishing for Milk."

The publicity circular sent out by this organization reads in part as follows:

"France faces a milk famine! Above national privation looms this big problem. Milk for babies! Milk for wounded soldiers! Milk for men and women dying of tuberculosis! The need is tragic!

"So short is the supply of milk throughout France that infants are fed the diet of older children. Young babies are given soups and stewed vegetables. Thin, diluted milk falls to the lot of little children. Wounded soldiers, carried bleeding from battle, receive heavy soups when a few drops of milk would mean life.

"While in France innocent children, wounded soldiers, and wasting consumptives are suffering for lack of milk, in the United States there is abundance and to spare. Shall not America hail this dire necessity as another opportunity to show that spirit of friendliness that has bound the two republics together for a century and more? We must help. No question of international diplomacy or political expediency is involved. It is the appeal of heart to heart. It is a human cry of need!

"War has plunged its ugly hand into the very vitals of France. Beyond the village and hamlet it has gone out into the pastures and farm lands. Cows have been requisitioned by the army and not replaced. Owing to the shortage of feed, farmers have had to kill off their cattle. At least 2,000,000 thus have been lost. The total decrease in the number of cattle has been over 16 per cent. The falling off in the milk yield has been proportionately heavy. France is now producing only one gallon where two and one-half were produced before the war.

"To conserve milk the French government is taking vigorous measures. Great care is devoted to the protection of milch cows. From bombarded towns, under military escort, two or three at a time are led back to places of safety. Farmers are constantly urged to make all sacrifices possible to provide proper feed for them. Within the city of Paris a herd of cows is kept under civic care. Government restriction now forbids the serving of milk or cream for any purpose in restaurants, hotels, or public eating places after nine o'clock in the morning. In private homes, whether noble or humble, milk is voluntarily restricted to young children and the sick. This is a widespread effort to put the inadequate supply of milk to the most essential uses. Yet available milk in Paris today is so scant that it costs 32 cents a quart.

"Milk is the most perfect human food. For the young child or baby it contains properties essential to growth. There is no equal substitute for the infant.

"The shipment by the Committee for Free Milk for France of a ton of dry milk a day, or 8,400 quarts, means sustaining nourishment for 8,400 French babies. This is a veritable gift of life. For the death rate of babies in warring Europe ranges from 58 to 98 per cent. If milk will save some of those poor little souls, born into the world to be snuffed out at the end of a few months, America will surely send generously.

"For the adult, milk is a balanced ration. It is more easily digested than any other food and is concentrated nourishment. For the pain racked, bruised, and torn body of the wounded soldier, milk is an absolute necessity.

PRETTY MILKMAIDS ON MOTOR TRUCK SEEK MONEY TO SEND MILK TO FRANCE

With the slogan "Free Milk for France" a batch of pretty milkmaids started out on this truck to secure funds in a week's campaign. They want to raise enough money to send a ton of dried milk to France daily so that babies and wounded soldiers will be supplied.

"Thousands of tubercular soldiers can be cured only by fresh air and adequate nourishment. Milk is absolutely necessary to them in their weakened condition."

Dairymen and others who may be interested may write Mrs. Josephine Osborne, 675 Fifth Avenue, New York City, for further information; or make checks payable to Free Milk for France, Inc., and send to Henry C. Cooper, Treasurer, 37 Wall St., New Work City.

A Dairy Day Dream

HOARD'S DAIRYMAN:—In company with my son I went out into the field one day not long ago, where a fine bunch of full-blooded heifers were pasturing. It was a beautiful day, still and calm, not a puff of wind blowing. The sun was shining brightly, turning into gold the backs of our young stock, grazing so peacefully in the kneedeep grass. As we went along we had been talking things over. At the sound of our voices the heifers looked up and started toward us.

"Don't you think they are fine, father? We never had heifers like these. Look at this one, now."

The pretty little thing had come up to my son. His arm was over her neck and she was looking up into his face with all the love and confidence such a creature can show. The others pressed so closely about us that we were in danger of being swept off our feet. It seemed as if they knew we loved them and wanted to show their love to us. We backed off a little way, only to be followed quickly by our fine friends of the tender heart and the inarticulate tongue.

"They surely are fine!" How could I help saying it? "They will make cows that we will be proud of, won't they? It has cost something to get them, but it is worth while, isn't it?"

Then we let our thoughts run back to the beginning of our dream of better stock. When we brought home the first little heifers with their mate, leaving behind $105.00 for the three, it seemed like quite a price to pay. Would we ever realize the worth of our money? The question would come up; but hope kept saying, "Surely you will. Just be patient, keep on dreaming and working toward the end you have in sight and everything will come out right."

We gained slowly. It was not all sunshine. When we would have liked heifer calves, calves of the other kind came. There were some losses. These, I am sure, did not discourage us, although it was a bit hard for my boy to nurse one of the choicest heifers in the time of her first great crisis as faithfully as any doctor ever cared for a patient, watching over her night and day, only to see her gradually slip away across the boundary to the land where I am sure all good, gentle, tender spirits go. That was an experience calculated to make us all better, and to cause us to wonder just where is the dividing line between man and his mute, uncomplaining farm helpers.

But we did get ahead slowly, and

Subscrsption Rates

Subscription in United States and Mexico $1.00 per year; 6 months, 50 cents; 3 months, 25 cents. Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through Wm. Dawson & Sons, Cannon House, Breams Building, London, S. C., Eng., or their agents, including the news dealers and book sellers in all foreign countries.

Subscription agents for New Zealand—Bray Bros., Agricultural Hall Building, Dunedin, New Zealand. Also—The New Zealand News Co., 150 Wakefield St., Wellington, N. Z.

Subscription agents for Australia—Australasian News Co., 226 Clarence St., Sydney, Aust.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $2.56, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of the Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome immoral and quack advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any adver tiser's dealings with a subscriber are in b faith or evidence a lack of business honor. Advertisers generally recognize the reade Hoard's Dairyman as an up-to-date c farmers, who farm with business-like and we hold our columns for the pa only those with whom our reade deal with profit and satisfaction.

ADVERTISING COPY mus received eight days previous to the d publication. Advertising to be cla changes in advertising must reac days previous to date of

Entered at Fort Atkinson, as second class matter.

Campaigns Against Rats

To reduce the $200,000,000 loss in food and other property destroyed annually by rats, the Bureau of Biological Survey of the United States Department of Agriculture is giving advice as well as assistance in a number of state and local campaigns against this worst of pests. Statewide campaigns are in progress in in Mississippi, West Virginia, and Georgia, while Maryland, Minnesota, and Alabama are planning to take up such work in a few weeks. These campaigns are usually made through county agents and emergency workers, by co-operation with the States Relations Service. The Board of Health of Kansas has been making a state-wide educational campaign against rats, while many local organizations in cities, village, and rural communities have been engaged in active efforts to eliminate these animals. An indication of the increasing interest taken by the public in this work is shown in the steadily increasing demand for anti-rat bulletins and posters published by the Department.

A good cow can produce her own value every year, but every cow—good, bad, or indifferent—is a good eater, and many a bossy is petted and fondled and tolerated who eats her head off every year without saying a word about it. Now dairying is not a matter of sentiment but of business. The values involved are large; the consumption is heavy; the labor is excessive; the risks are many; the public is exacting, intelligent, and critical, and only the best of modern business methods will insure a continuance of patronage or a balance on the right side of the ledger.—Eugene Davenport.

The DAIRY OPTIMIST

W. LIVINGSTON LARNED

Jealous of the Farm

The big cars rumble past our place,
With fancy trimmings and the like,
And, on again, at city pace,
Upon a pleasure-loving hike.
But, honest, I can see them look
From out the frummery and fuss,
Upon the old barn and the brook
As if they truly envied us.

"That's pretty," we can hear 'em say,
"It's peaceful there, beneath the trees,"
And it's the plaintive, earnest way
They talk, that somehow seems to please.
For one brief moment, as they pass,
Deep in their hearts, they'd like to bide,
Here, with the fields of dew-wet grass,
And lowing herds, on every side.

The city! Oh, it's good enough,
If that's the only thing you know.
But when a man's hand's brown and rough
His heart by toil is softened so.
He grows to love the humble earth,
And all the bounty of it's range.
You keep the town for what's it's worth—
I wouldn't change—I wouldn't change.

Of all the slackers on earth, durin' these war times, th' one that makes me th' maddest is th' farm hand that claims he's too sick to get out of bed, but wants his strawberry short-cake sent up to him.

Observations of the Oldest Dairyman

"War can't be quite as bad as five farmers in a country store, arguin' pro and con, about alfalfa."

There's this difference betwixt men and cows—a cow will chew a cud an' say nothin', but th' average man not only chews his cud but talks politics at th' same time.

When I see my herd out grazin' in the orchard, with the blue sky above and grass an' clover as fer as th' eye can reach, I'm mighty glad that Mr. Hoover hasn't got around to pasture-land yit.

"The farmers over at Mountaintop tried an experiment. They all chipped in and bought a fine pure-bred Guernsey bull, and signed an agreement for co-operating breeding."

"How did it turn out?"

"All right, until the various wives started differences and didn't speak. That started the men fussing. Now when one on 'em wants the bull, he goes over and says: 'You low down, good-fer-nothing whippersnapper, I don't like you and I won't talk to you but lend me our bull'."

The Way it Works Out

"What do you think of the way your hogs are coming along this year?"

"Well, they looked mighty fine to me, until one of those balanced ration gents came around with diagrams and phtographs and warnings and mineral-ingredient charts. Ever since then I somehow have the feeling that my hogs are as fat as a pen full of fine tooth combs."

Drinkin' Cream

The little girl is drinkin' cream,
(The roses in her cheeks are red)
And, on her lips, sweet clovers seem
To bloom instead.
She sips it with contented air,
And:—"Oh, it's goody!" hear her say;
Then, with the south wind in her hair
She runs to play.

The little girl is drinkin' cream,
(Health looks from out her dancing eyes)
And I can see the pastures dream
Beneath fair skies.
The blessing of the herd is here;
A treasure, born of grassy wealth.
And cows that dot the bright fields near
Mean world-wide health!

You Can't Afford This

No farmer is rich enough to feed 40-cent butter to his hogs or his calves in partially skimmed milk.

It's a waste of money.

It's a waste of food.

It's a waste that your pocketbook, your neighbors, your country, all condemn.

But it's a waste that is going on today on every cow-owner's place where an inferior or half-worn-out cream separator is being used, or where the farmer is skimming by the wasteful "gravity" method.

And its a wholly unnecessary waste, too.

Because a De Laval Cream Separator will soon save enough cream to pay for itself, and put a stop to all the waste of cream and time and labor for many years to come.

There is no other cream separator that can compare with the De Laval in clean skimming, capacity, ease of operation, freedom from repairs, and durability. It's the world's greatest cream saver.

Order your De Laval now when you need it most and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or, if you don't know him, write to the nearest De Laval office as below.

The Small Grain Separator

J. L. JUSTICE, Indiana

FARMERS who grow a great deal of small grain, such as wheat, oats, rye, and barley, often suffer big losses due to delay in waiting for a threshing outfit. A few days of wet weather and high winds after the grain is cut and in the shock not only reduce the quality of the grain in many instances but reduce the yield as well.

It was for the purpose of getting their grain threshed as soon as it was in condition to be threshed that two young farmers in my neighborhood invested in a small separator last year. They already had a tractor, and as the neighbors in their old ring offered to patronize them they considered their investment worth while, for they were farming two hundred acres of land with their tractor and had a great deal of grain of their own.

The result was they threshed out two other rings besides their own, threshing 82,000 bushels of oats and 5,000 bushels of rye, wheat, and buckwheat. They had never before had any experience with a grain separator. Here is what they say about it:

"Our separator is a 28-40. Most of the larger separators are 40-60s, but we did practically as much work with ours as they did with the larger ones. It may seem hard to believe, but I'll tell you the reason why we did it. We kept our machine going all the time, we never had to stop. Usually if a larger machine has to stop it is to wait for the bundle wagons.

"Our separator will take the oats just as fast as two bundle pitchers—one on each side—can throw them in. It will take wheat and rye through just about as fast, but the self-feeder has a regulator on it so that in case the bundles are thrown in too fast the self-feeder automatically slows down or stops until the grain inside the separator gets to flowing smoothly. In this way we get perfect separation of grain and straw, no grain is blown over, the screens are not crowded and therefore the grain is well cleaned, and there is no unusual strain on the machine."

SEPARATES WHEAT, OATS, RYE, AND ALL SMALL GRAINS

This machine threshed on our farm and the quality of work it does cannot be excelled by the bigger separators. The owners operate it with 10-20 horse power tractor, using the tractor other seasons of the year for work on the farm. This tractor furnished an abundance of power for operating the separator under all conditions, but they were careful to thresh only dry grain.

FIRST HAND DAIRY EXPERIENCE

A New Hampshire Farmer's Story as Related to a Meeting of Farmers in Maine

NOW, when you stop to think of it, how many of you have better cows than you had twenty years ago? Have you done your part in bringing up the production of your herds? If you are keeping a 4,500-lb. cow, do you realize what it would mean to you if you could put in her place a 6,500-lb. cow? The minute you made the change you would automatically reduce the cost of producing any given amount of milk from 20 to 22 per cent. Why? Because the cow producing the smaller amount consumes just as much roughage and requires just as much time and care as the other cow. The expenses outside of the grain cost are practically the same.

I will tell you briefly what I did in my own herd and why I did it. I was forced to do one of three things—to decrease the cost of production, because I could not increase the price for which I was selling—or to go out of the dairy business and adopt some other system of farming—or to go off the farm. There was no other business open to me at that time but the dairy business.

In the year 1898 my father died, leaving me the management of the home farm, heavily mortgaged. At his death I had not only the farm but the obligations which had to be met. For a while everything went along smoothly. We had what was considered a good dairy herd at that time. We were getting a living, and now and then I would reduce the mortgage a little; but as the price of feed and labor began to advance, increasing the cost of production of the herd and, as the price of the product did not advance in proportion, the margin became less and less until, at the end of the year 1903 when we took an inventory and tried to settle the bills and start on a good business basis for the next year, I found myself some $200 or $300 short of enough to meet the expenses. I assure you it was a serious problem to me, with the obligations hanging over me and with no other methods that I could adopt, so far as I knew, that would change conditions. I took a day off and used my head a little. And, by the way, I think that if our farmers generally would take a little more time to study conditions, and do a little more thinking, and study their own business a little more, perhaps they might be able to adopt some methods that would be worth while.

After doing that I said to myself, 'we have here 16 cows. There are 16 machines that I am using to convert the products of my farm into cash— a cash income and a profit, if I can get any. They are the market for the crops I grow and if those machines can handle that more economically, my income will be so much more. If one can handle what she consumes more economically than the other, she is the more efficient machine.' So after thinking the matter over carefully I decided that on the first day of January I would open an account with each individual cow. I knew that I had some good cows, as every dairyman has. I thought perhaps I might have some that were not as good as I could get.

AN IMPROVED DAIRY HERD

"If you are keeping a 4,500-pound cow, do you realize what it would mean to you if you could put a 6,500-pound cow in her place?"

On the first day of January I opened an account with each cow, and I am going to tell you briefly just what I found after a year's work. I found that the best cow I owned at the end of the year 1904 had produced 6,115 lbs. of milk, or 339 cans of 8½ quarts each, and her average test was 4.2 per cent. She produced 256.84 lbs. of butterfat. She made a pound of butter for every 20.2 lbs. of milk. In those days of labor cost and feed cost that was a profitable cow. If I had owned a herd of that kind I should not have had the deficiency I had to meet. Unfortunately for me, they were not all that class of cows.

For the purpose of comparison, I want to divide that herd of 16 cows into two herds of 8 cows each, one containing the 8 best and the other the 8 poorest cows. The 8 best cows in 1904 averaged 258 cans of milk and 258 lbs. of 85 per cent butter. The 8 poorest cows averaged 192 cans of milk and 200 lbs. of butter; a difference of 58 lbs. of butter per cow. You see what that means in cash. The 66 cans of milk at 56 cents a can would amount to $36.96, or a total difference on the 8 cows of $295.68.

I want to show you what I was able to accomplish after ten years' work. The records of that first year were a lesson to me. I had to take another half day to study and find out what was best. I decided that I would dispose of all the cows in my herd that did not produce $10 worth more of dairy products than the feed cost. That would give me a basis to start on. Then I would go out and buy a pure-bred sire from a good producing cow out of a herd where records were kept and I could judge from the production point of view. I have followed that work from that time to this. I have not only kept the records but I have weeded out the poor cows. Instead of selling my best cows when the dealer came along I have sold the unprofitable cows, until in 1914 we had as a best cow one that would produce 9,580 lbs. of milk, or 532 cans, with an average butterfat test of 5.1 which would mean 488.77 lbs. of butterfat.

For purposes of comparison I want to take the best half of the herd in 1904 and the best half of the herd in 1914. In 1904 the best half of the herd produced an average of 258 cans of milk, and 258 lbs. of butter. In 1914, the best 16 cows averaged 7,144 lbs. of milk, or 397 cans, 379.84 lbs. of butterfat, or 446.87 lbs. of 85 per cent butter; a difference of 139 cans of milk and 188.87 lbs. of butter. This was an increase of 54 per cent in milk production and 73 per cent in butter production. Let us see what the value of the increase is. One hundred thirty-nine cans of milk at 56 cents per can is worth $77.84. Now we come to what it costs to produce that milk. In our herd we feed on the basis of one pound of grain to 3½ lbs. of milk. We claim that the cow producing the extra milk does not consume any more roughage than the other cow, but she does need more grain—more concentrates. Figuring on the basis of one pound of grain to 3½ lbs. of milk, and figuring grain at what I was paying for it last month, the extra milk would cost $18.08. The net value of the increase in milk would therefore be $59.76 per cow, which in a herd of 20 cows would amount to $1,195.20.

I want you to look very carefully at these figures. I want you to realize what it would mean to you if you could increase the production of your herds to that extent, and I want you to know that I have had to labor under the same disadvantages, and meet the same obstacles, the same drawbacks, that every farmer has to meet. We meet with these at some time, all of us, but if we continue at the job, using our best judgment in the weeding out and selection of cows, and in the breeding, we can all of us improve our conditions materially, and I see no reason why we cannot improve them to the extent that I have been able to do.—From Bulletin of Maine Dept. of Agr.

Marketing Butter and Cheese by Parcel Post

By LEWIS B. FLOHR and ROY C. POTTS, U. S. Department of Agriculture

BUTTER is highly perishable unless it is handled under proper conditions, yet the fact that many consumers obtain their supplies direct from producers by parcel post indicates that parcel post marketing of butter is feasible. It is usually an economical method, as the cost of market distribution through the regular wholesale and retail channels of trade is relatively high in comparison with the cost of shipments by parcel post from the first and second and sometimes more distant zones.

Experimental Parcel Post Shipments

Shipments of butter aggregating more than 10,000 lbs. have been made by the Bureau of Markets, under various conditions and in packages carrying from 1 to 10 lbs., over both long and short distances, in order to test various kinds of shipping containers, methods of packing, and the possibilities of parcel post shipping of butter during the summer and other seasons. These experimental shipments consisted of (1) shipments of fresh butter from four creameries to the Bureau, and (2) shipments of the butter received from the creameries by the Bureau to experiment stations and return shipments of the same.

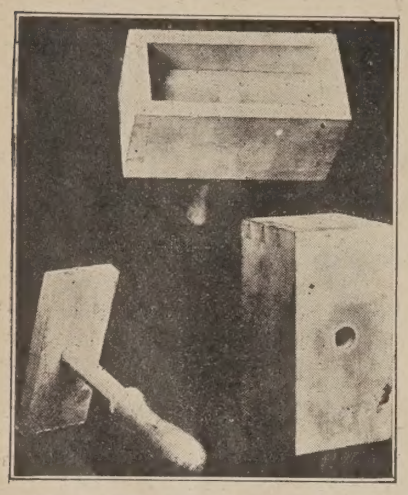

Fig. 1—Two views of hand printer for 1-pound prints.

Although many of these shipments were made during the heat of summer, only 14 of the 454 shipments, or 3.1 per cent, were received in an unsatisfactory condition. These very satisfactory results may be attributed to the care exercised in the proper packing of the butter in suitable shipping containers and the precooling or thorough hardening of the butter at the creameries before shipment.

The experimental shipments to the state experiment stations were satisfactory where the temperature and distance were not too great. Butter which had softened much in transit from the creamery to the Bureau when later shipped to the experiment stations did not arrive in as good condition as that in which the grain had not been previously injured. In general, the shipments from Washington were successful when forwarded as far north as Maine and as far west as Michigan and Indiana. Shipments into the South were successful for shorter distances.

The results of these experimental shipments indicate that well-made butter, thoroughly chilled before shipping, when packed in a suitable container, may be marketed satisfactorily by parcel post when extreme high temperatures are not encountered. Under ordinary conditions, where the butter does not melt, and a firm or semi-firm condition is maintained, the shipping of butter by parcel post generally may be successful. Even though proper safeguards were taken, the shipments made during extremely hot weather frequently arrived in an oily and unsatisfactory condition.

Quality and Condition of Butter

As parcel post shipments of butter are likely to be subjected to conditions, especially during the summer, which may cause deterioration and injure the quality of the butter, it is highly desirable that every possible precaution be taken before shipment. Particularly is this true of farm-made butter, because conditions affecting its quality and condition usually can not be controlled as easily on farms as in creameries. However, farm-made butter should be marketed just as satisfactorily as creamery-made butter when it is properly made and prepared for shipment.

It is necessary to maintain proper conditions in the care of the milk and cream and the making of butter if a marketable product is to be produced. Too much importance cannot be given to the maintaining of cleanly conditions in the stable and in other places where the milk, cream, or butter are produced or kept, for they absorb odors and spoil very quickly. It is important, too, that these products be kept in a cool place. High temperatures should always be avoided, as heated cream or butter produces a soft, oily condition in the finished product which is undesirable. In manufacturing butter on the farm or in a factory the buttermilk must be removed and washed out, and the proper amount of salt must be incorporated evenly. Frequently parcel post shipments of farm butter are unsatisfactory to customers because proper methods were not used in making it, and thereby the quality and condition of the butter were injured before it was shipped. For the satisfaction of customers it is important that a uniform quality of butter be produced.

Preparation for Parcel Post Shipping

The methods used in preparing butter for parcel post shipping depend largely upon the local conditions and the style of package used. To insure delivery in the best possible condition, butter, after being packed or printed and placed in cartons, should be chilled or hardened thoroughly before it is shipped.

One of the most satisfactory ways of preparing butter for shipment is in the form of regular 1-pound prints. The standard print measures 2½ by 2½ by 4⅝ inches. A hand butter printer or mold should be used in forming the prints. The printer shown in figure 1 is so made that it can be taken apart readily and thoroughly cleaned. The print of butter is easily removed from the mold by the false bottom. Another style is made with the sides and ends hinged to the bottom and held in place by hooks across the ends. After the butter is packed in the mold the sides are unhooked, so that the butter can be removed from the printer. One-pound hand printers similar to these styles may be secured from dairy supply companies or they may be made on the farm.

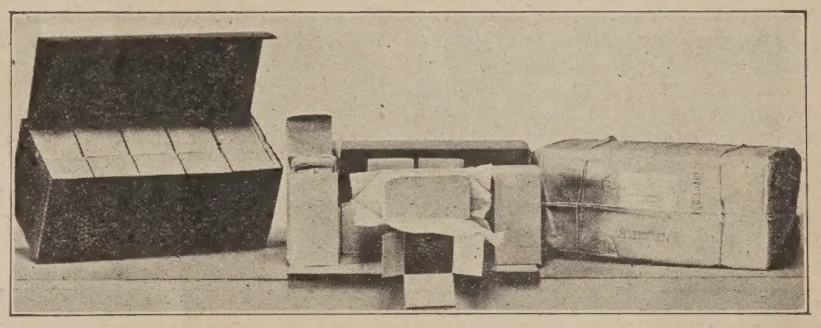

Fig. 2—Three stages of a parcel post package of butter: wrapped, opened, showing print of butter.

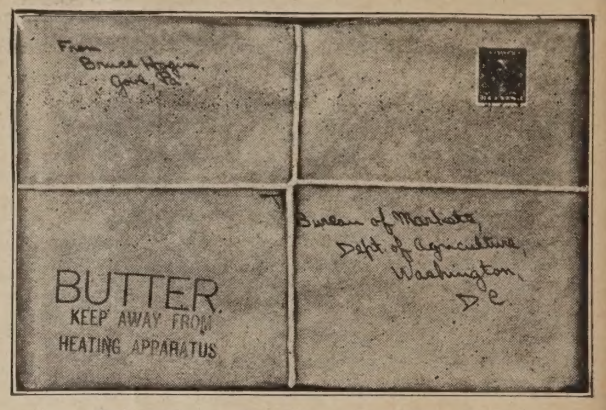

Each pound print should be neatly wrapped in regular butter parchment or paper. A second thickness of such paper has been found to add materially to the carrying possibility of the butter. Waxed paper may be used for the second wrapping. As a further disposition to the print, it should be placed in heavy manila paraffined cartons, which may be obtained from folding paper box companies for about one-half cent each when unprinted or at a slightly additional cost when printed as a stock carton or with a special private brand.

Shipping Containers for Butter

Corrugated fiber board shipping containers of various sizes may be obtained for shipping 1-pound prints of butter. (See fig. 2.)

These boxes or containers practically insulate the butter and furnish much protection against heat. Further protection may be obtained by wrapping the container in stout wrapping paper. The whole should be tied securely with a strong cord. In tying the twine, it should be drawn tightly around the package so as to insure its proper carriage. Not infrequently packages are broken open or otherwise damaged because they are insecurely tied. The corrugated containers are also useful for carrying shipments of butter put in other styles.

Some persons ship butter by parcel post in improvised or "home-made" containers. Clean, discarded, corrugated paper board cartons are obtained from the grocer or other merchant at small cost or frequently without cost. It is possible to cut a piece of paper board in such shape and size that when it is folded it will form a satisfactory carton. In figure 3 is shown a piece of paper board that is cut so as to provide a carton for shipping 3 lbs. of butter that is wrapped in parchment paper and several thicknesses of newspaper.

Parcel Post packages, like other mail matter, should be carefully addressed. A rubber stamp for butter shipments bearing the statement, "Butter—keep away from heating apparatus", may be used to show that the parcel is perishable and should be handled accordingly by postal employees.

For this carton the paper board was so cut that it was 7½ inches wide and 25 inches long with projections in the middle of the length which were 4½ inches wide and extended 8½ inches on each side. This provided a carton with dimensions, when folded, as shown in the illustration, of 4½ by 6 by 7½ inches.

Butter shipped in an improvised container should be wrapped in parchment paper and several thicknesses of newspaper and then should be securely tied with string. The package should then be inclosed in the piece of corrugated paper board with the projections of the paper board so folded as to form a container. The container should then be tied with twine, wrapped in heavy wrapping paper, and again tied securely with a strong twine.

If butter that is prepared for shipment in this manner is thoroughly chilled before being mailed, it should carry safely even in warm weather if it is not in transit over 24 to 36 hours.

Examples of Successful Marketing

A few of the many instances which have come to the attention of the Bureau will indicate with what success butter may be marketed by parcel post.

A farmer's wife who was making a good quality of butter was securing but little more than half retail price a pound for it when a trial shipment was made by parcel post to a consumer in a large city. As a result of this shipment, a demand was developed and customers obtained for the

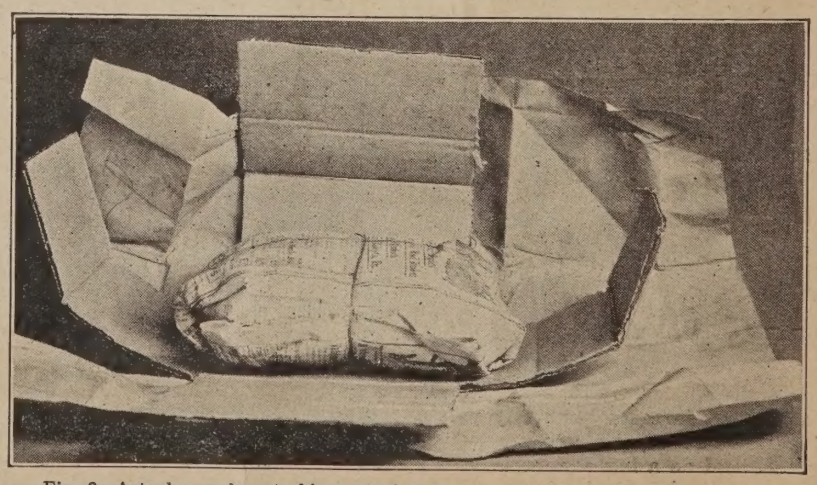

Fig. 3—Actual parcel post shipment of 3 pounds of butter wrapped in parchment paper, several thicknesses of newspaper, corrugated paper-board carton, and finally an outside wrapper of heavy wrapping paper.

entire product at an advance in price to the farmer's wife and with a considerable saving to the customers under the retail price of the best creamery butter.

A number of creameries have developed an extensive parcel post business. One which has a large output markets practically its entire product direct to consumers or retail distributors, except in the flush of production in spring and early summer. Another has developed a substantial parcel post trade by sending out a weekly price list. Formerly this creamery used newspaper advertisements, but the manager says that the quality of the butter is sufficient advertisement.

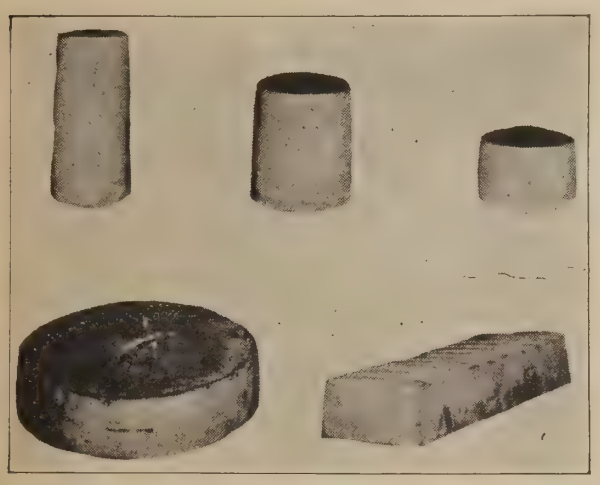

Fig. 4—Cheese for parcel post mailing. In some of the important cheese producing sections Swiss and other varieties of cheese are frequently cut into suitable blocks for parcel post shipping.

Essentials for Success

Successful parcel post marketing of butter requires that extreme care be taken to insure the delivery of a satisfactory product to the customers. The following are a few of the important considerations to be observed to market butter successfully by parcel post:

1. A uniformly high quality product should be produced.
2. It should be properly packed in neat and attractive packages.
3. The shipping container used should amply protect the butter from deterioration and damage.
4. The packages should bear the address of the sender and be properly addressed to the customer.
5. The most expeditious mail service from the mailing office should be used to insure the delivery of the butter in the best condition.

Longhorn (Wt., 12 lbs.) Flat (Wt., 21 lbs.) Young America (Wt., 8 lbs.) Brick, (Wt., 10 lbs.) Midget (Wt., 4 lbs.)

Fig. 5—Various styles of American Cheddar cheese suitable for parcel post shipping.

Varieties and Styles of Cheese

Most varieties of cheese, being firm and not subject to damage by high temperature as butter, may be shipped any distance by parcel post without difficulty. (See fig. 4.)

The two important varieties of cheese produced on farms are cottage cheese and American (full cream or whole milk) cheese. Cottage cheese is soft and quickly perishable, therefore it is consumed while fresh. When made rather dry and packed in moisture-proof packages it may be shipped to points where delivery may be made within 24 to 36 hours. The first and second zones are usually the practical limits of shipping cottage cheese by parcel post.

As American, Swiss, Brick, and several other of the firmer varieties of cheese are ripened or cured and paraffined before they are marketed, they can be more successfully shipped by parcel post than the soft varieties, such as cottage cheese. The more common styles or forms in which the firmer varieties of cheese are marketed are prints, bricks, and cylindrical shapes. The prints are made by cutting the larger styles of cheese into square "prints" weighing usually 1 pound each. Bricks are made in molds of the desired size. Cylindrical-shaped cheese, both flat and long, are commonly known by various trade names such as Midgets, Picnics, Young Americas, Longhorns, Daisies, and Flats. On the Pacific Coast a type of cheese called "Jack," which closely resembles the "Daisy" size, is marketed by parcel post. The usual weight and shape of several styles of cheese, suitable for parcel post shipping, are shown in figure 5.

Packaging Cheese for Shipping

General care should be exercised in the packaging of cheese for shipment by parcel post. The surface of the cheese should be clean and, if necessary, paraffined. As a protection to the cheese it should be wrapped in several layers of paper, preferably with a waxed paper next to the cheese. Corrugated or other fiberboard containers or wooden boxes may be used as shipping containers. (See figure 6.) When rather weak fiber board or wooden boxes are used they should be wrapped with several sheets of tough paper.

Addressing and Mailing Parcel Post Packages

Parcel post packages, like other mail matter, should be carefully addressed, including the street number of the person to receive the parcel. In the upper left hand corner the name and address of the sender should be plainly written. It is preferable to place all addresses on the package itself rather than on a tag tied to the package, for if the tag becomes detached the addresses of both the sender and receiver are lost. A rubber stamp for butter shipments bearing the statement: "Butter—keep away from heating apparatus," may be used to show that the parcel is perishable and should be handled accordingly by the postal employees, the letters in the word "Butter" should be one-half inch high, the others one-fourth inch high.

Fig. 6—Suitable container for shipping cheese.

In shipping by parcel post such a perishable product as butter, which is affected by exposure to heat, inquiry should be made of the post office regarding the daily mail service for parcel matter from that point to the destination of the shipment. Arrangements should be made to post the packages as near as practicable to the mail time in order to obtain delivery in the quickest possible time.

Consideration should be given to the practicability of using night mail service when available, as the temperature is usually cooler at night than in the day time. Night shipments to points within the first and second zones ordinarily are delivered early the next day.

In a general way the foregoing precautions suggested for butter should be observed in shipping cheese.

Postal Requirements

Postal regulations provide that—

When it (butter) is so packed or wrapped as to prevent damage to other mail, it will be accepted for local delivery either at the office of mailing or on any rural route starting therefrom.

Butter will be accepted for mailing to all offices to which in the ordinary course of mail it can be sent without spoiling when suitably wrapped or inclosed or when packed in crates, boxes, or other suitable containers to prevent the escape of anything from the package, and so constructed as to properly protect the contents. More than 50 pounds can not be sent beyond the third zone.

The firmer varieties of cheese, not being liable to cause damage in the mails, need no special consideration when properly packaged. In some cases it will be found that the express can be used to better advantage than the parcel post.

The rates on parcel post packages vary according to their weight and the distances shipped. Persons not familiar with the postal regulations governing parcel post shipments may obtain specific information at any post office regarding the rates and limits of weight and measurement applicable to shipments to any other office.

Canned Milk vs. Can Milk

HOARD'S DAIRYMAN:—The American dairy farmer presents the spectacle today of quaking in his boots when some innocent bystander chances to mention the cost of cattle feed and hired labor. You wearily hear that milk in some sections of the country is a drug on the market, although the theorists have startling figures to prove that the demand should far exceed the supply. Likewise butter and cheese, instead of being welcome company on every well regulated table along with meat, wheat, and eggs, are plainly told they're a crowd. Ice cream is now considered a luxury inasmuch as it requires sugar—hence one more thrifty outlet for milk has gone glimmering. As a consequence, the subdued and discouraged dairyman is told that until more ships become available for sending the surplus abroad and until the reluctant consumer realizes the importance of increasing her milk consumption and paying the necessary price for it—he must needs accept short prices for his commodities and if he can gamely hang on for a few years—the Lord will provide.

Here enters the case of Canned Milk vs. Can Milk—a situation in the dairy world which has quietly and strongly been developing right under our noses for several years past but which I have never seen discussed as a powerful factor in our present low-prices-and-surplus-condition. In New York State the Borden's Farm Products Company are about to unload their highly efficient and highly expensive milk plants onto the willing and waiting shoulder of certain local Dairymen's League branches who believe that they will be consummating a clever stroke of business sagacity thereby. I do not pretend to be well enough informed in these matters to absolutely know whether or not these contemplated investments will prove glorious successes or disheartening failures—but it would seem to one on the outside looking in that this is an inauspicious time for any dairying community to contract a debt of several hundred thousand dollars if the Bordens are unable, with their well known training and talents, to make these plants pay. But the illuminating fact which stands out in connection with these deals is that the other sister company, the Borden's Condensed Milk Company, is not offering their plants for sale. As I understand it, these latter factories are mainly located in the middle west where top prices for milk are not received, and if one were to investigate the finances and outlook of the latter company and other great companies similarly engaged, it might be surprising to find them decidedly prosperous and quite up to par.

The Farm Products Company devotes the greater part of its resources to bottling and shipping milk and cream to New York City. Even at the present low prices paid the producer and the so-called high prices paid for milk by the consumer, the profits to the middlemen have not been sufficient to insure fat dividends of the old Borden standard and in cases the milk dealers have gone to the wall as well as the despised dairy farmer—a well known incident of the kind having occurred when the late lamented Mutual-McDermott companies ignominiously retired from high milk life. Therefore, since there is no profit in handling just milk owing to a demoralized market and chaotic war conditions and because the use of fresh whole milk is decreasing instead of increasing as we would fondly believe, the Bordens are getting out from under with speed and shrewdness—and if there are some who fail to see the way the wind is blowing, it will prove highly profitable and pleasant to the former milk trust.

The reason why fresh milk may be doomed to exist only for a beverage in the future is found in one little word of six letters—CANNED. Some of us little realize the great and growing use of evaporated and condensed milk. It is time we batted our eyes open and looked around to see the ones who have quietly made off with a large part of our market while we slept.

As we are well aware, the consumer balks at paying from twelve to sixteen cents a quart for milk. That she balks not wisely but too well does not help matters in the least. But she must have milk—a certain quantity, and incidentally that which she now chooses is uniform in quality and always good. She finds her answer on

Dairy Supplies or Equipment of Any Kind

We are manufacturers as well as dealers and we are therefore in a position to give the dairyman the very best value for his money considering the high quality of our goods.

The following are some items selected from our big Dairy Catalog. They are pieces of equipment which every dairyman can use to advantage and are sold under The Creamery Package Mfg. Company's guarantee of quality.

New Elgin pattern Milk Can, 10 Gal. size	$5.55
Duro Sanitary Milking pail with hood, 10 qt. size	1.60
Chapman Changeable Strainer	1.70
Jupiter Can Brush	1.75
Pail balancing scale 30-lb. capacity	2.85

Complete description of these and all other equipment in our catalog will be sent on request. Send your check for items you want and they will be shipped direct to you.

The Creamery Package Mfg. Company
68 W. Kinzie Street, Chicago, Ill.

PURITY

You may not be able to control the original quality of the milk, but you can easily protect it from loss if the proper cleaning material is used.

Milk utensils washed with

Wyandotte Dairyman's Cleaner and Cleanser

are considered by experts who understand milk production as being free from everything that might cause the milk to become impure.

Is Peat a Stock Feed?

A. C. McCANDLISH, Iowa

AT all times there are a large number of benevolently inclined individuals ready and willing to assist the farmer in solving his most perplexing problems. The "gentry" are probably more numerous than ever before and a very enticing proposition put forward by many of them is the utilization of peat in stock feeds.

The peat deposits of America are large, there being about twenty million acres of peat in the United States and thirty million acres in Canada, and consequently they have at times attracted a considerable amount of attention. Vast as these areas are, they wane to insignificance when compared with the peat deposits of Europe. Continental Europe possesses about one hundred and thirty-five million acres of peat, while the British Isles have about six million acres of which three million are in Ireland, a country of about one-half the size of Iowa. Consequently much of our information regarding the utilization of peat will come from Europe where it is relatively more important than it is here.

Considerable effort has been expended on the reclamation of peat bogs and rendering them fit for agricultural purposes and from time immemorial peat has been used as a fuel in many sections. Within recent years peat has also been subjected to much industrial research and from it are produced litter, building blocks and tiles, paper, and peat fiber which is used in the manufacture of carpets, rugs, horse blankets, and similar articles.

For some time also peat, in a dried form, has been used to some extent as an ingredient of cattle feeds, and for the proper understanding of the role which it plays when so utilized a knowledge of the method of formation and chemical composition of peat is necessary.

Peat is formed in insufficiently drained areas and results from the decay of plants partially or entirely under water. The Sphagnum and Hypnum mosses are perhaps the typical plants from the remains of which peat is formed but other groups such as the grasses, rushes, and sedges, are also of importance. These plants, growing in waterlogged localities, partially decompose under anaerobic conditions and in the following year another crop is superimposed on their remains to subsequently decay under similar conditions. This process, repeated year after year, gives rise to the peat.

The nutrients in feeding stuffs which are of value to animals are the carbohydrates, fats, proteins, and ash, and the possible occurrence of these in peat should be of interest in this discussion. The plants from which peat is formed contain these nutrients but during the peat formation they undergo many changes.

The carbohydrates are disintegrated and the main result of this is the formation of carbon dioxide and water. The portion of the carbohydrates which resists this action to the greatest extent is the fiber. The fats likewise are broken down while the proteins undergo putrefaction with the formation of ammonia, amino acids and other compounds of much simpler constitution than the proteins themselves.

The ash of the decomposing plants is probably less radically changed than is any of the other constituents. The annual growth of the semi-aquatic plants adds greatly to the amount of organic matter present—the carbon being obtained from the carbon dioxide of the air—but it does not add to the stores of ash or mineral matter in the peat. This is due to the fact that the plants of one season have to draw on the remains of previous growths for the ash constituents which they require and in this way the mineral elements in the peat deposits decrease in concentration rather than increase from year to year unless outside factors enter in.

Two extraneous agencies, which tend to increase the ash content of peat, do have to be taken into account. These are wind and water and they carry into some peat bogs large amounts of sand (silica) and clay (alumina) but although these add to the ash content of the peat they are of no value to the plants growing thereon.

Regarding its use in cattle feeds it may be said that dried peat has been used to a considerable extent in Europe and to a less extent in America in the making of mixed feeds. It is generally used as an absorbent for molasses though at times it may be used as an adulterant of other feeds.

Its use as an absorbent for molasses is perhaps justifiable as it keeps the molasses in a form easily handled and many men are willing to pay for this convenience, but the assumption that the peat, in itself, has an appreciable feeding value, is wrong.

To begin with, the peat used in the preparation of those feeds may contain anything up to 25% of moisture and the buying of water in mixed feeds is always an expensive proposition for the farmer. Then the claim is frequently made that the peat will neutralize any free acids present in the molasses, but the peat is in itself acid in reaction and so cannot neutralize any acid that might be present in the molasses. In addition neither beet nor cane molasses are acid in reaction as a general rule.

Where the ash content of peat has not been affected by wind or water borne materials it will be low and of little consequence so far as the animal economy is concerned. On the other hand, peats that contain these added materials may have exceptionally high ash contents. Peats containing 11% and more of silica are known and if such were fed to animals they would be harmful rather than beneficial as such a large quantity of sand would produce intestinal irritation and might even result in the death of the animals.

The fats or oils in peat are practically negligible quantities and are very probably not available to animals. At times the dry matter of peat may contain about 1% of fatty materials, a small proportion of which might be digestible.

The materials which go to make up peat contain proteins but these are to a great extent broken down in the formation of peat and give rise to simpler nitrogenous compounds. In the Bulletin of the Imperial Institute (1905) it was reported that peat free from moisture generally contained 0.0 to 2.6% of nitrogen and it has been shown that 6.6% of this might be utilized by animals. If this nitrogen that might be utilized were protein nitrogen we might expect at the best to find .8% of digestible protein in peat.

Of the carbohydrates practically none of the nitrogen-free-extract is available though a little of the pentosans might be, but they are of doubtful value even when digestible.

The fiber has still to be accounted for. The dry matter of peat contains varying quantities of this, up to 25%,

SANDERS SOSLAND, MISSOURI

IV. FREIGT CARS AND FEED

"WHAT will alfalfa be worth next winter?" the writer inquired of one of the largest alfalfa hay dealers in the world. The answer to this question, of course, is in part a matter of guesswork, even for the greatest handler of the legume, as the course of prices of any commodity which is not controlled cannot be foretold with perfect accuracy. However, all extensive dealers in alfalfa hay follow market conditions closely, and the views of the one I questioned are naturally the best obtainable.

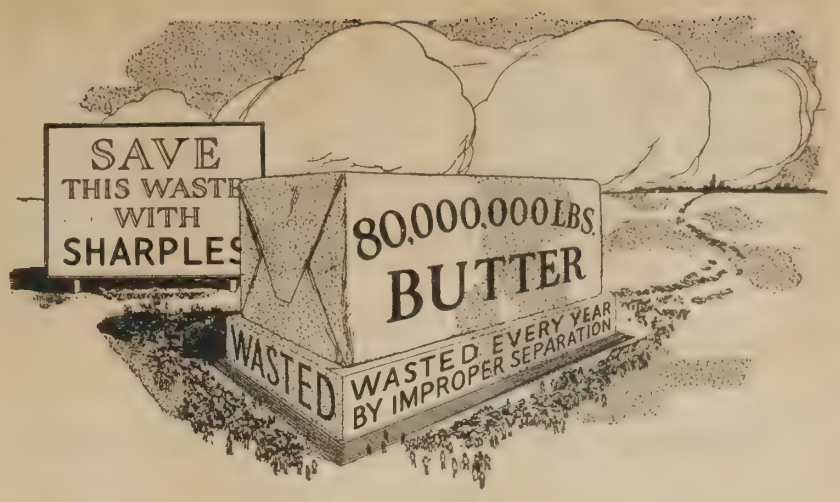
"It's to a large degree a matter of freight cars and the transportation situation in the country between the present time and next winter," was the reply I received. "A possible drouth, corn crop failure, and other natural factors also will influence the trend of prices of alfalfa hay, but the freight equipment situation is more important than ever as a deciding factor in the market for alfalfa and for other feedstuffs."

The dealer who told me this has been handling alfalfa hay since the arrival of the first car of that variety in Kansas City in 1898. He has drawn upon practically every available source of production, likewise has distributed hay to every state in America. With him, the possibility of a serious car shortage and congestion of traffic facilities of the country is receiving serious consideration, and incidentally much study.

Other important handlers of feedstuffs, including cottonseed feed trade interests, mill feed producers and dealers, grain men, and other members of the industry, were questioned as to the outlook for prices during the coming winter, and, invariably, possible car shortage and traffic congestion were given as noteworthy influences. Experiences of the last few years, particularly the past twelve months, have led the entire feedstuff industry to prepare for a shortage of freight car equipment and against traffic congestion. Transportation difficulties delayed the movement of feeds for many months the last few years. In some cases delays of as much as four months were experienced in the last year. Manufacturers, dealers, and producers were as hard hit as dairy and other live stock feeders.

The feeders of live stock, particularly dairymen who use a great amount of alfalfa, doubtless remember well the course of prices of alfalfa hay in the crop year 1917-18. Prices reached the highest level in history, $35 per ton in Kansas City, and there were many predictions made by close students of the trade that $50 would be the level for the legume before the close of the crop year. These dealers were making the $50 prediction with the idea in mind that the car situation which at that time was the most serious in the history of the United States, would continue indefinitely. However, the "tight" car situation soon began to ease, and suddenly there was a virtual flood of alfalfa hay as well as other varieties on the market. Shippers were not frantically rushing to sell, for they, too, were waiting for the $50 level. The flood of alfalfa was the hay that has been delayed in transit on sidings and elsewhere probably two to three months. Railroads had finally caught up on their orders for cars, and found themselves in a position to supply the demands of hay shippers. The result was an almost immediate slump of $10 in prices for all varieties of hay. Before the decline, it was car shortage and traffic congestion that sent prices up $15 a ton. Other feed dealers suffered sudden changes, but not so erratic as alfalfa and other hay. Texas and the New England States, as well as southwestern states, suffered so badly from car shortage that they appealed to Washington and to Congress and paid exorbitant prices last winter to obtain feed to save their stock.

While feed dealers were encountering difficulty because of a scarcity of cars, there was at one time more than 1,000 cars of alfalfa hay in transit from the Northwest consigned to the Kansas City market. And, more than 500 cars were awaiting shipment. Cottonseed feed manufacturers and other trade interests reported hundreds of cars in transit or ready to be loaded.



Will car shortage and traffic congestion be witnessed again during the coming fall and winter, and will conditions be as serious? This is the vital question which war feed club members are asking of their leaders, and the leaders are attempting to answer. Difficulty of an uncertain degree seems ahead. Co-operative feed clubs can best solve the problem by making purchases of the winter feed supply during the late summer months or at least before congestion of traffic facilities and car scarcity become serious, especially if markets seem fairly attractive or inviting.

Close students of traffic conditions are inclined to the belief that a shortage of cars will be witnessed. The winter wheat belt is harvesting one of the greatest crops of winter wheat in the history of the country—more than 600,000,000 bushels or practically twice the yield a year ago. The yield of oats, too, will be one of the greatest on record; likewise, the area planted to corn is the second largest in history. Railroads, even at the present time, are being taxed in supplying cars for the movement of wheat to market, and country advices indicate that farmers are not inclined to hold their bread grain but will ship to market as soon as cars are available. Oats will follow wheat, then another great movement of corn will begin. Furthermore, there is an indication of a crop of 107,000,000 tons of hay for the United States, one of the largest crops in history, which will increase further the need for cars. Expanding war plans with the accompanying burden on railroad resources also must be considered.

Railroads are reported building 100,000 freight cars to move the larger crops. While the government has ordered additional freight cars and other equipment, most of this material is moving to the East and to the war fronts of Europe, where thousands of trains are needed to expedite the movement of troops, munitions, and other military supplies. And railroads are sending their experienced trainmen to the war fronts to operate the trains.

Industries essential to the winning of the conflict in Europe are operating on a vast scale, and, of course, there is an increased need of freight cars to move war materials to the seaboard. Never before have munition industries operated on such a vast scale, and the same applies to cotton mills and other great manufacturing enterprises which are contributing toward the winning of this world war. All seek more and more railroad cars.

It can be seen that railroads will be called upon for a huge number of cars. Before the opening of the world war, car shortage was a common subject, and one can hardly expect elimination of this difficulty even

A Butter Monument to the Wrong Way of Doing Things

Government authorities find that this amount of butter (80,000,000 pounds) is *wasted* annually—even though the majority of dairies use separators that are *supposed* to be clean skimmers, and are advertised as such.

Think how deplorable this waste is—especially as some great men have stated that the war-tide may be turned either way by *fats alone.* (It's not true, though, as we will win, fat or no fat.)

This great waste could be eliminated by complete national use of

SHARPLES
SUCTION-FEED
CREAM SEPARATOR

Due to patented suction-feed, Sharples is the only separator that absolutely guarantees clean skimming *at any speed.* One day you may turn fast—another day slow—but you get *all* the cream; no waste; no variation in thickness.

Contrast this with the cream waste of fixed-feed separators when turned *under* speed—which happens most of the time.

When you use a Sharples you know that you are not contributing anything toward that 80,000,000 pounds butter waste.

Write today to nearest office for catalog, addressing Dept. 10.

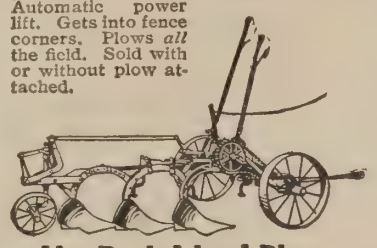
Heider

The Real All-Purpose Tractor

With the Famous Friction Drive



There are good reasons why Heider Tractors are making such unusual economy records. One of the reasons is in the Heider Special Friction Transmission—said by leading engineers to be the biggest success in the tractor industry. It means less gears, fewer parts, less trouble, less chance for breakage. Lower upkeep cost. Smooth power—flexible—impossible to jerk the load—less strain on the machinery—longer life for the engine.

Seven Speeds forward or reverse with one lever and without disconnecting the power.

Model "D" 9-16 H. P.

with Rock Island No. 9 Plow attached. The time and work saver in plowing. Your hands operate the tractor while your foot raises or lowers the plow. Automatic power lift. Gets into fence corners. Plows *all* the field. Sold with or without plow attached.

Use Rock Island Plows

and get the best results behind your tractor. The famous Rock Island "CTX" bottoms turn the furrow slices clear over—prevent air spaces from stopping moisture. *Front furrow wheel lift.* Extra high clearance. Built of extra strength material and heavily braced 2, 3 or 4 "CTX" bottoms. Send for our catalog showing Rock Island Tractor Plows.

Rock Island Farm Tools

include Plows, Discs, Planters, Seeders, Cultivators, Listers, Hay Rakes, Hay Loaders, Cream Separators, Manure Spreaders, Gasoline Engines, Stalk Cutters, etc.

When Writing to Advertisers, Mention Hoard's Dairyman

with the government conducting the railroad traffic of the nation.

Congestion of transportation facilities promises not to be so severe as a year ago, but railroad officials do not predict a free movement of freight. With the shipping situation relieved from the serious plight of a year ago, due to an increased efficiency in the building of more steamers, traffic will suffer less delay at the seaboard, thus allowing a freer movement of freight cars.

In view of the foregoing, is it not well for feed buyers who must draw on outside sources for supplies to figure it worth while to insure against the impossibility of obtaining deliveries? In other words, is it not better on some such needed feedstuffs to buy even if the lowest market is not available in order that there shall be no paucity of serious proportions on one's farm or in one's community? Each war feed club and each community and individual must settle this question.

Also, it is well to remember that there were times in the last year when sharp premiums were paid to obtain cars of needed feed, and that at other periods severe declines were accepted by sellers when the car supply increased and permitted liberal and perhaps excessive shipments. It is legitimate to take advantage of such situations, but to attempt this means taking chances, and one must bear in mind that insurance against interruption of arranged rations and feeding plans is worth something.

"Experience," it has been said, "is the best teacher." Recall feeding experiences of the past that arose from car shortage and freight congestion, think of the times last winter when New England dairymen offered anything asked for even hay, to say nothing of more concentrated feeds because they suffered from tie-ups on railroads, and study your own position. Do not rush into a high price period for feed to insure against trouble, but do not wait too long lest you over-stay the market and suffer losses and delay. The new crop year feed outlook is still not clear, for it has not yet progressed sufficiently, so wait before buying. But consider the problem of freight cars in making your feed plans.

Goat's Milk for Infant Feeding

This is the title of Bulletin No. 249 published by the New York Agricultural Experiment Station and prepared by Dr. W. H. Jordan and Professor G. A. Smith. The following is the summary of the bulletin:

1. During the years 1910-1912, inclusive, a herd of milch goats was kept at the Station. The number of animals of which complete records were kept varied from 10 to 26.

2. In the year 1912, 31 adult and 9 partially grown animals were fed. The quantity of food consumed was as follows:

Dry, coarse feed	3,740 lbs.
Beets	1,550 lbs.
Cut grass	24,000 lbs.
Pasture	132 days
Grain	14,688 lbs.

3. The total cost of this feed, at the prices then ruling, was $441.95. The average cost per month per goat varied from $0.481 to $0.992. The average cost of feed per goat per year was $11.05, making the daily cost $0.03.

4. The yearly production of milk, including some animals in the first

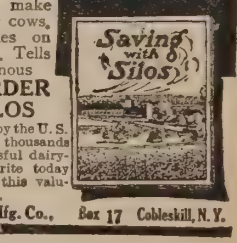
Ward Work-a-Ford

Gives you a 12 horsepower engine for less than the cost of a 2 horsepower. The Ford car has a powerful engine—it will outlast the car—and you might as well save your money and use it to do all your farm work. **No wear on tires or transmission.** Hooks up in 3 minutes. No permanent attachment to car. Can not injure car or engine. **Friction Clutch Pulley** on end of shaft. Ward Governor, run by fan belt, gives perfect control. **Money back if not satisfied.** Ask for circular and special price.

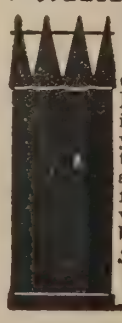
THE WARD CO., 2012 N St., Lincoln, Neb.



Don't blame your Cows-Get this Book-It's Free

It shows the way to make more money on your cows. Written by authorities on dairy feeding. Tells why the famous

HARDER SILOS



are used by the U. S. Govt. and thousands of successful dairymen. Write today and get this valuable book.

Harder Mfg. Co., Box 17 Cobleskill, N. Y.

Winner Opening Silo Roof

Fits any silo—wood, cement, tile, or iron. Makes silo filling convenient and easy. Increases your silo capacity eighteen to thirty-five tons. Easy to install. Write for prices and full particulars. **Agents wanted for this profitable line.**

Satisfaction Guaranteed.

period of lactation, varied from 301.7 lbs. to 1,845.2 lbs. The average yearly yield for 10 animals of which records were kept during 3 years, including 28 lactation periods, was 800.4 lbs.

5. The feed cost of the milk per goat for all the goats during the year 1912 was 4 cents per quart and for the three years during which the record was kept 3.4 cents. The lowest cost was with the Saanen goat, No. 11, for the year 1911, which was estimated to be 1.27 cents per quart. The other items of cost, such as care and overhead charges, it is not possible to give with any accuracy. The average feed cost for a quart of milk from the Station herd of 25 Jerseys during the three years has been found to be .92 cent per quart.

6. The range of composition of the mixed milk of the whole flock as determined during May and June of the year 1912 was as follows: Solids, 11.4 per cent to 11.9 per cent; solids not fat, 7.72 per cent to 8.61 per cent; fat, 3.5 per cent to 3.8 per cent.

The composition of milk from individual goats was found to vary in total solids from 9.22 per cent to 18.55 per cent; in protein, from 2.24 per cent to 4.96 per cent; in casein, from 1.56 per cent to 4.6 per cent; in fat, from 1.08 per cent to 8.4 per cent; and in ash, from 0.43 per cent to 0.8 per cent.

7. A chemical study of the goat's milk indicated no essential difference between the constitution of its casein and that of cow's milk. Marked and probably important differences were observed in the salts of the ash as compared with the ash of both cow's milk and human milk.

8. Extensive study of the use of goat's milk in infant feeding by Doctors Sherman and Lohnes of Buffalo showed that the curds of goat's milk when returned from the stomach were smaller and more flocculent than those of cow's milk. From the determination of the combined hydrochloric acid in the returned food, the authors conclude that the cow's milk had a greater stimulating effect on the stomach than goat's milk. The absorption of the food and gain in weight in comparing the two milks were indefinite for several reasons. The babies tolerated equally well similar amounts of goat's milk and cow's milk when used with the same diluents. The younger the child, the more the evidence pointed toward a greater gain on goat's milk.

9. Goat's milk was supplied to 18 cases of children that were not thriving on any other food that had been tried. In 17 cases a satisfactory state of nutrition was established through the use of goat's milk, the beneficial results in some instances being very marked. With certain of these children their situation was regarded as serious, and their restoration to a satisfactory nutritional condition was good evidence that goat's milk is often a very desirable resort for infant feeding.

Again the Hired Man

HOARD'S DAIRYMAN:—I have read with much interest the letters about the hired man. I am a hired man myself, not because I have to be but because I am just as well off without a farm of my own. I think there has never been such a good time for the hired man to save money and be independent as there is now.

I pity the young hired man who works from 4 a. m. until dark, Sunday and every day, spending all his hard earned money without preparing himself for the future. A farm hand who can run a binder, handle six horses, and milk cows is only a common farm laborer, but if he learns how to manage an up-to-date farm by taking a short course in agriculture at the university, then works at least one or two years on some good farm, I assure him that if he feeds bedbugs and eats oleomargarine it is his own fault. Besides all that, I think a person who eats oleomargarine will soon have not much left to feed bedbugs.

If one farmer treats you badly, don't curse the whole colony or leave the state; his next neighbor may treat you like a prince or as his best friend. A farmer who calls a hired man a tramp will very likely treat him like a tramp; indeed, he makes a mistake in mistreating his man as he not only gets a bad reputation in the community but he may be the means of making a tramp out a good man.

I once worked for a farmer breaking in two young horses on a plow. The team got scared at a wood-sawing outfit and ran away with me down the hill. I stayed with them until they were running about 30 miles an hour, then threw myself backwards to get out of the plow wheels. The horses had a 40-acre field to take their exercise in and I had to spend my hard earned money in a sanitarium for over three weeks. All the thanks I got was that the farmer told me that if I had stayed with the horses, I might have been able to hold them down. It was this same man who would not allow me to wash the sore shoulders on the horses or keep their collars clean. It was "Just hurry up and get to work." I ought to have refused to take the horses out or have notified the humane society when he would not allow me to attend to their sore shoulders.

Madison, Wisconsin. C. T.

Aphids Attack Vetch and Oats

HOARD'S DAIRYMAN:—This has been an unusual season in the Williamette Valley, Oregon. The spring was cooler than common, and when the green aphis began to show up on fruit trees, and then attacked the oat fields and the vetch, people said a few days of hot sunshine would check or kill the aphids. The hot days came along in June. But the aphids covered the leaves and stems of the vetch clinging to the plants until they dropped dead; their whitish bodies literally covering the ground in places. The vetch plants had become as yellow or brown as clover straw and about as worthless for feed.

Aphids being a new pest in the valley, few farmers realized in time what damage they could do. Those who cut their vetch early, although it was immature, gained. The vetch ground then was in good shape to plow, with moisture enough in the soil to give potatoes or fodder corn a good start.

The showers that usually come in May were lacking, also the good rain along in June. Consequently pastures are as brown here now (a few days from the Fourth of July) as they sometimes get in August in Wisconsin or Minnesota.

Last winter and spring, farmers sold off cows, but the end is not in sight yet, and if things continue it will take more than a small size Liberty Bond to buy a cow when hay and grain get down to a reasonable price. Grain hay is selling for twenty-four dollars a ton in Portland Valley, timothy brings twenty-seven, and Eastern Oregon timothy sells at thirty-three dollars a ton. The prospect for kale is not encouraging as many of the plants succumb to transplanting these warm days. Potatoes are forming tubers and growing, and corn is more than the proverbial knee high by the Fourth.

Haying began earlier here than usual, and is a lighter crop. Many oat fields intended for grain, damaged by aphids, will be cut for oat hay.

Oregon. CLEON J. EMERY.

They Fit All Tractors

Clark "CUTAWAY" DISK HARROWS

THE Light Tractor Double Action type embraces all features of the heavy engine harrows, adapting them for successful use with *all* Light Tractors.

Once over thoroughly pulverizes every inch of soil, resulting in bigger and better crops. Light Draft.

They have adjustable universal hitch—two levers set all four gangs—draft rods distribute pull uniformily—hardwood oil-soaked bearings in dust proof boxes.

Write for our book "The Soil and Its Tillage" giving interesting knowledge that you will like to have.

The Cutaway Harrow Co.

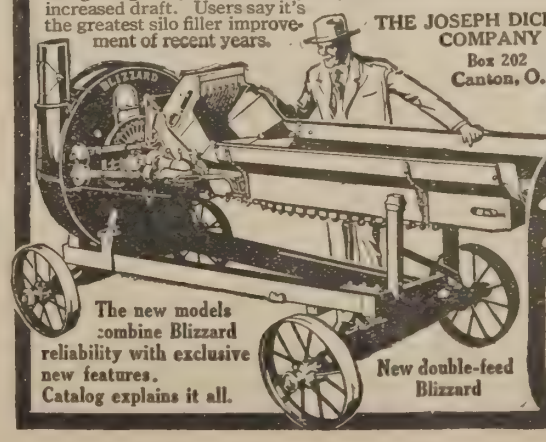
It does the work!

DICKS Blizzard Ensilage Cutter

The Blizzard Ensilage Cutter will fill *your* silo, no matter how high it is. It will cut evenly—run steady as a clock, day after day, season after season. *It does the work.*



CAUTION! There is only one Blizzard Cutter. Blizzard is *not* a general name for silo fillers. "If it isn't made by DICK, it isn't a Blizzard."

You have your own ideas about a silo filler—and the Blizzard will meet them. You can take your time with the filling and do the work with a very small engine. Or, you can crowd the corn into the silo in a few hours if frost threatens.

Capacity for capacity, *minimum power* is required with a Blizzard. Get one of the new Blizzard double-feed cutters on the job and capacity will depend only on the number of teams and men you can get. The endless belt feeds the corn in a steady stream—comes close to actually feeding itself—saving work, and gives greatly increased capacity without increased draft. Users say it's the greatest silo filler improvement of recent years.

The Blizzard principle of knives and fans on patented fly-wheel makes the most of the power. 100 ft. silos are filled as readily as 30 footers. The Blizzard is tried and true. Steady as a clock! Simple in construction, operation, adjustment. Parts of wear all replaceable at small expense. Every silo owner ought to have a Blizzard catalog. Write for it.

THE JOSEPH DICK MFG. COMPANY

Do and Don't Economy

Two ways of saving food there be: Do and don't economy. Don't is just the dreary sort—tightening belts and going short—keeping ration rules in mind. Don't is much the harder kind, and absolutely necessary. Do provides a better show. Do means making food crops grow. Do is good, productive toil—digging every foot of soil. Do economy is fun—growing twenty spuds from one. Don't economy and do, hand in hand, will see us through. Don't is do's defensive brother. Each of them must help the other.—U. S. FOOD ADMINISTRATION.

Arrangement to Keep Flies from Milk Strainer

We found in operation on the Crane Bros. Guernsey Farm in Indiana a simple device for keeping flies away from the milk strainer. This arrangement consists of a piece of cheese cloth made into a bag about one-half the size of a 50-

Illustration No. 1, showing device for covering milk strainer; milker recording weight of milk and scale for weighing milk. Note tin top covered milk pail.

lb. flour sack. This is put over a heavy fence wire, bent into a square. This wire is fastened to a wall a little higher from the floor than the top of the milk can. From this wire that holds the cloth an iron rod is fastened which reaches nearly to the floor and is fastened to another piece of iron which is fastened to the wall near the floor. This piece of iron near the floor forms a lever. It is about 8 inches long, with two holes in it; one near the end, for fastening the iron rod which extends the wire holding the bag; the other hole is for fastening it to the wall. Bear in mind there are two levers in this arrangement, one near the floor and the other at the top. The wire which holds the bag is bent to form a lever.

The accompanying illustration will help to understand its construction and how it operates. Illustration No. 1 shows the milk can and the strainer covered with the bag made of cheese cloth. Illustartion No. 2 shows the bag lifted for straining the milk. Note that the milker's left foot is on

Illustration No. 2, showing how cover is raising for straining the milk. No time is required to operate this device as the cover is raised by stepping on a lever.

the lever next to the floor. As one end of the lever is pushed down the other rises up and the rod, which can be seen, extending from the lever at the floor to the wire, on which the bag is placed, is pushed up and this raises the bag from the top of the strainer. As soon as the milker takes his foot from the lever the bag drops back and again covers the strainer.

The flies can crawl over this cover but they cannot get into the strainer or come in contact with the milk. The flies on the Crane Bros. farm, so far as milk is concerned, must "starvarize."

New York Milk Prices

HOARD'S DAIRYMAN:—After another series of conferences with dealers which threatened several times to end in a general milk strike the Dairymen's League finally succeeded in getting most of the dealers to accept the prices set by the League for both August and September milk.

The League prices are $2.70 for August and $2.90 for September per hundred pounds for 3% milk at 150 miles from New York, subject, of course, to the usual freight and butterfat differentials. The prices are decided advances over the corresponding periods last year as the 1917 August price was $2.45 and the 1917 September price was also $2.45, in what was known as the second district. Thus the 1918 August price is 25c a hundred more than that of last year and there is a difference of 45c a hundred between the two September prices.

Directly after the July prices were established by the Federal Milk Commission the League served 30 days'

PURE-BRED GUERNSEY CALF

This calf was given by Crane Bros. to their Local Red Cross. Tickets were sold at 50 cents each. The total number sold was 1030, and the calf brought the Red Cross $515.

notice on the Commission that it would no longer be bound by the prices fixed by the Commission. This left the League free to set its own prices for August and September with the results mentioned above. The contracts with the dealers were drawn for three months, July, August, and September, and provided that if the August and September prices were for any reason not set by the Federal Milk Commission that they should have the approval of this Commission or of the Federal Food Administration. The Conferences on the August and September prices between the dealers and the League were attended by Judge Lamb representing the U. S. Food Administration and the prices set by the League were approved by Judge Lamb and later by the Federal Milk Commission. Thus the Food Administration stands back of the League on prices set.

Prices to the consumer will be set by the Federal Milk Commission and have not yet been announced.

The prices for the next two months represent another accomplishment of the Dairymen's League. The League officers were determined that the time had come when producers should have at least cost of production. Their determined stand for living prices was finally justified by the acceptance of the August and September contracts by most of the dealers. The fact that prices were set for two months instead of one will please dairymen also for it is unpleasant, to say the least, to face trouble with the dealers every thirty days.

The milk condensing companies made the most profitable this time, as they have at every contract time since early spring. They claim that the market for condensed and evaporated milk is still in very bad condition and also that a lower price to producers in the West makes it impossible to pay a higher price here. At this writing not all of the manufacturers and condensers have agreed to the August and September prices. Some claim they will close some plants no matter what the price is as they have no market. The League believes, however, that agreement will be reached and that practically all the plants can be kept open. E. R. EASTMAN,
The Dairymen's League, Inc.

Schoharie County (N. Y.) Calf Club

At a recent meeting of the Schoharie County, New York, Boys' and Girls' Calf Club, 62 entries and contracts were made. The allotment took place June 29 when there were fully one hundred farm families gathered at the State School. President B. H. Bruce of the County Breeders' Association gave a talk concerning the animals and the method of financing the project. The First National Bank of Cobleskill finances the Club this year. The boys and girls have made a simple form note which they sign with their parents, promising to pay the face value plus interest at the rate of six per cent per annum. Two dollars were added to the face value of each note as insurance in case of loss, this amount to be paid toward purchase price if any calves are lost. The number and values of the calves in the drawing showed a marked increase over those of last year. Last year 17 animals were distributed at an average cost of $77.68. This year 62 animals were allotted at an average cost of $99.62. About a year from now the calves will be brought together and sold at public auction. The boys and girls owning calves may bid them in if they care to do so. In the meantime every member of the Club keeps an accurate record of the expenses of the animal. The one having the best records will receive a reward at the time of sale. Also the member which has the animal showing the best improvement for the year receives a prize.

New York. H. D. BAUDER.

Chicago Milk $2.75 in August

Dairy farmers in the Chicago district will receive $2.75 per 100 lbs. for milk in August. A fat test of 3.5 per cent is required. This price was settled upon at a meeting held July 16 and presided over by W. E. Lamb, attorney for the United States Food Administration.

A decision on August milk prices was delayed through a change in the charge to be made for labor. Increased cost of labor on farms brought about an allowance of $.30 per hour for this item in caluculating from the formula now used in determining the cost value of milk. The formula adopted by the Chicago Milk Commission allows a cost for producing 100 lbs. of milk of 20 pounds of home grown grains, based on the value of corn; 24 pounds of manufactured feeds; 110 pounds of hay; and 3 hours of labor.

Intelligent co-operation, alert to meet every emergency, and victory is ours.

Hot Weather Health Hints

"Be fit" is now our country's call to every man.

The farmer, upon whom the nation depends for the food to keep our fighting men "fit", must also keep in the best physical condition. His, too, is a man's job!

Unfortunately, farmers, as a class, have neglected to look first to their physical well-being. Life in the open is in their favor, but too often farmers who are robust and healthy, and free from physical defects usually have become so in spite of, and not because of, any systematic effort to keep fit.

Practically 28 per cent of all young men from rural district's examined for the draft were found below standard. This means that nearly one-third of the youths from country homes, between 21 and 31 years of age, were physically or mentally unfit for military service.

We should begin now to correct some of these mistakes.

Summer Increases Health Risks

Many conditions on the farm make health risks greater in summer than at other seasons. Farmers will help to keep themselves on the safe side during the warm months by following carefully certain rules of hygiene and sanitation.

The farmer needs a varied diet of wholesome food, limited in the main to three meals a day. He should drink liberally of water between meals. If possible he should take 15 to 20 minutes rest after dinner and supper. Regularity in bowel functions is absolutely necessary for health.

Small cuts, bruises, and scratches should be given attention to prevent infection or blood poisoning. In case of a skin puncture occurring, for example by stepping on a nail, the wound should be opened, cleansed with boiled water, and tincture of iodine applied immediately. If it becomes inflamed a physician should be called at once. Medical advice should be sought in all cases of punctured wounds. Cuts or scratches should be treated with iodine or a wet dressing of a boric acid solution made by dissolving in hot water all the boric crystals or powder that the water will absorb. Care should be taken to keep dirt out of wounds. On the first indication of marked illness the farmer should seek proper medical advice.

Heat May Be Fatal; Take Care!

During very hot weather the farm worker needs periods of rest and should drink reasonable quantities of cold water—not ice water. Upon the slightest sign of dizziness or unusual fatigue he should stop work for a little while and, if possible, bathe his head, hands, and arms in cold water. Such precautions will tend to avoid sunstroke and injury to health from what may be regarded as heat exhaustion.

The diet in hot weather should be largely milk, vegetables, fruit, and cereals. It should contain very little meat. Constipation is at all times serious and likely to impair one's health, especially during the hot summer months. The general tendency is to eat too fast and too much.

Remember that the teeth are a valuable part of the organs of digestion, and that a reasonable quantity of food is sufficient to keep up the strength and support activities, and at the same time to relieve the system of undue burden.

Keep the Home Airy and Clean

The farm house should be well lighted and ventilated in every part. Especially in the sleeping rooms should there be plenty of window space and fresh air admitted day and night. There is nothing in the old belief that night air is dangerous. In reality it is safer to breathe than day air, because with lessened traffic night air contains less dust.

Prevention is Better Than Cure

Let in the sunlight.
Sleep with the windows open.
Guard the water supply from impurities.
Dispose of sewage by building a septic tank.
Protect food from decomposition and dangerous bacteria.
Keep the school house clean and its outbuildings sanitary.
Remove garbage and manure promptly from the home surroundings.
Abolish every breeding place for flies to prevent insect-borne ills.

Screen all windows and doors against flies and other insects.

Shrubbery and trees about the home should be well trimmed to admit plenty of sunlight.

Cleanliness in the home is always important. Old carpets should be removed and rugs, if used, should be frequently cleaned and exposed to the sunlight. A bare floor, with a few well-cared-for rugs, is much better than a carpeted floor.

Every farmer should take great pains to keep his water supply pure. This means careful attention to the location of outhouses and disposal of sewage and manure. Investigations have shown that from 20 to 40 per cent of farm and rural wells are unsafe. It is of the utmost importance, therefore, that drainage from the barn or outhouse does not reach the water in the well.

Driven and drilled wells are much safer than dug wells and so, no matter what may be the difference in cost, are preferable. Of course every well should have a tight cover and no stagnant pools should be allowed to remain about it.

Sewage Brings Disease Dangers

Poorly constructed privies present a constant danger of disease. The masonry and shelter-house should be made fly-tight and be so constructed as to keep out rats, mice, squirrels, and domestic animals. At frequent intervals reasonable quantities of unslacked or water slacked lime should be thrown into the vault to disinfect and deodorize the contents.

A sewage disposal plant consisting of a septic tank and disposal unit, the latter of a kind best adapted to the lay of the land, character of soil and natural outlet, is considered the safest means of removing human wastes.

The farmer may also have running water in his home in connection with modern plumbing. These conveniences lighten farm work, promote health, and make the warm weather more endurable.

Flies Shun a Clean Barnyard

The family health also depends upon the sanitary condition of the barns and yards. Manure piles become breeding places for flies and other insects, besides producing annoying odors. Wherever practicable manure should be spread upon the fields direct from the barns and stables.

Do not allow garbage to accumulate about the house; it should be placed in a barrel (fitted with a tight cover to exclude flies) and fed to the hogs before it begins to decompose. Its surroundings should be kept clean so as not to attract flies. Garbage should never be thrown carelessly on the ground.

Food Protection Saves Illness

Danger to health from poorly protected food is especially present in summer. Without ice many foods spoil quickly and become unsafe to use. Heat rapidly increases bacteria in milk, hastens decomposition, and spoils it as a food product. Every farmer should arrange if possible for an ice supply, especially if there are children in the home. If possible all perishable foods should be kept in an ice-box. If ice cannot be obtained the foodstuffs should be stored in a cool, well ventilated part of the basement. Every home should have a good basement preferably under the entire house, and it should be kept dry. A pit in the earth also serves well to keep foods cool.

The location of the average farmer is such that if he will give proper attention to a few things he may far excel his city cousins in robustness and health, and the avoidance of various ailments and diseases, but even the sunlight and open space of the country cannot counteract the effect of poor ventilation, poor sewage disposal, flies, and impure water supply.

Be careful in caring for farm animals. There are many diseases common to animals and man.

Community Health Should Be Aim

Every farmer should try to stimulate the interest of the community in the betterment of health conditions in his township. He should see that stagnant pools are drained; that rubbish on premises or highways is removed; and that creameries and cheese factories in the district are kept in a sanitary condition, free from decomposing milk or by-products.

The farmer owes it to his children to see that the schoolhouse is well lighted and ventilated, the heating facilities ample, the water supply safe, the play grounds dry and clean, and the outbuildings sanitary and fly-tight. No dry sweeping should be tolerated in the schools any more than in the home. The school house should be thoroughly cleansed outside of school hours, daily or weekly, as the conditions may demand.

Finally, in every case of communicable disease, known or suspected, if a physician is not employed be sure to report it to your local health officer. —Dr. C. A. Harper, State Health Officer, in Wisconsin Bankers' Farm Bulletin.

IMPORTED GUERNSEY CALVES WHICH WERE RECENTLY DISTRIBUTED AMONG THE MEMBERS OF THE LEBANON, INDIANA, BOYS' CALF CLUB

MEMBERS AND THEIR FAMILIES OF THE INDIANA GUERNSEY BREEDERS' ASSOCIATION HOLDING THEIR ANNUAL MEETING ON CRANE BROS. FARM

Pork Quality and Foreign Demand

To acquaint hog growers of the United States with new conditions brought about by foreign demand, the Food Administration outlines the present situation and possible developments. Last fall, owing to the large amount of soft corn, there was a general heavy feeding of hogs, with a consequent large increase in their weight when they arrived at market. Foreign orders were filled with fatter and heavier hogs than the European populations had been accustomed to, and foreign buying agencies now request a return to the customary weights.

From the present outlook, swine producers may anticipate preference for lighter weights of hogs. This country is not likely to have to repeat any request for heavy feeding.

The condition outlined has been fully discussed by the Agricultural Advisory Committee which met in Washington in a recent conference with officials of the Food Administration and the Department of Agriculture.

Oklahoma Dairy Meeting

July 28 to August 3 is Farmers' Congress Week at the A. and M. College, Stillwater, Oklahoma. Three days, July 29, 30, and 31, will be given to the meeting of the Oklahoma Dairy Association.

EDITORIAL COMMENT

At a meeting of dairy farmers, to consider the price to be asked for milk, one of the farmers made a very pertinent statement. He said: "How do you farmers who are eating oleomargarine and producing milk square yourself with your conscience? Many of you have made the statement that dairy products are too cheap and when asked why you eat oleomargarine instead of butter, declare it is too expensive. If butter is too expensive for us, who produce it, to consume, how can we expect the wage earner to eat it? Aren't we setting a pretty poor example for the city consumers when we farmers eat oleomargarine instead of butter?"

Reports were current early this spring that well bred dairy heifer calves were being sold in some localities in Wisconsin for veal. Through county councils of defense, those interested in dairying, and county agents, steps were taken to save the good heifer calves. In one county a dealer in cattle when informed regarding the calf situation purchased every one worth saving. In another county a breeder went into the business of buying good calves and he bought over 600 head and sent them to Iowa. Some county agents started a movement to "raise-the-best-heifer-calves". These agencies were successful, so far as we have learned, in saving all good calves.

Those who have good calves or good cows to sell should advertise them or inform their county agent or some member of the county council of defense, for there is a splendid demand for grade dairy calves and cows and at better prices than they will bring for veal or beef.

PRACTICAL SUGGESTION TO THE NATIONAL DAIRY COUNCIL

The National Dairy Council is supposed to be engaged in an earnest campaign to advertise the importance to the consumer of a larger use of milk and milk products. Let us suggest a most practical way to spend a little money largely and widely to this end:

Have electrotype plates made newspaper column width of Bulletin No. 271 of the Wisconsin Agricultural Experiment Station entitled "Milk Necessary for the Nation's Health". In that connection with the work of Dr. McCollum, while he was a member of the Wisconsin force, no literature on dairy subjects has ever appeared that will have such a convincing grip on the mind of the city and town consumer as the facts shown in this bulletin, Send these plates to any newspaper that will print them. Thus would be brought home to the householders of the country the argument and the facts concerning nutrition that they are largely ignorant of but for the sake of their children they should know. The outlay need not be great, but the effect of the graphic illustrations and the text of the bulletin would be immense. A dollar spent in this way would go farther than a hundred dollars spent in the desultory way now in vogue for the lack of something better and more practical.

AITKEN APPOINTS ADVERTISING COMMITTEE

At a dairy conference held in Chicago some weeks ago, a resolution was passed empowering the chairman, Mr. D. D. Aitken, to appoint a committee of seven to help lay plans and provide means to advertise the food value of milk and its products. Mr. Aitken informs us that he has appointed the following men on this committee: M. D. Munn, chairman, Milo D. Campbell, John LeFeber, George W. Haskell, Charles Reed, E. S. Brigham, and M. J. Norton.

Milo D. Campbell is a dairy farmer in Michigan and president of the National Milk Producers' Association; M. D. Munn is a breeder of Jersey cattle in Minnesota and president of the American Jersey Cattle Club; John LeFeber is manager of the Gridley Dairy Co., Milwaukee, Wis., and president of the International Milk Dealers' Association; George W. Haskell is president of the Beatrice Creamery Co., Chicago; Charles Reed is a manufacturer of cheese in Wisconsin; M. J. Norton of Chicago represents the condensery interests and will serve till some one else is appointed to take his place; and E. S. Brigham is a dairy farmer in Vermont and Commissioner of Agriculture for that state.

Mr. Aitken has selected men who are capable and who represent the various phases of the dairy industry. We look forward to seeing them lay comprehensive plans that will increase the consumption of dairy products.

ADVERTISING DAIRY PRODUCTS

A truth of increasing importance is the need of advertising dairy products. Proof that their real nutritional value is far greater than is generally recognized is not lacking. Not only is milk and its products cheap at present prices, but, in McCollum's work, milk has been shown to have startling values—it is proved a necessity to complete nutrition of the young, at least, and perhaps of adults.

The trouble is, too few people have this information. There is much to be gained in awakening a larger appreciation of dairy products among dairy farmers themselves. But the greatest need is to inform the general consuming public. It was encouraging, therefore, to read a placard in a Chicago street car recently which advertised milk to the right people. Its source was sufficiently authoritative to carry weight and it seemed to us to be a splendid kind of publicity. The benefit which comes from such unorganized assistance to dairying we may hope will be the forerunner of a campaign of organized advertising with the entire dairy industry solidly behind it. The reading matter of the placard is here given:

CHICAGO DEPARTMENT OF HEALTH
HEALTH-O-GRAM

Milk at 10c is the best and cheapest of foods.
At 10c a quart every one should use it.
Take your bottle and a dime to the nearest milk depot.

Mayor and Commissioner of Health.

BUTTER AND OTHER FATS

In Bulletin 201 of the Connecticut Agricultural Experiment Station, Professor E. M. Bailey makes this statement concerning the value of milk fat:

"Although so nearly alike in energy-producing capacity, the fats show differences in other nutritional aspects. We refer especially to the growth-promoting properties possessed by some fats and lacking in others. It has been shown that butter possesses this peculiar efficiency to a marked degree and that the efficiency resides in the butterfat itself. This shows us an additional and important reason for the effectiveness of milk as a food for children."

Professor Bailey then goes on to say that some other fats possess this ingredient while lard and olive oil lack in this peculiar growth property found in butter as do those margarines which are made commonly from vegetable fats.

All fats are valuable fats but butter possesses substances known as "vitamines" or "accessory diet factors," which are not found in all vegetable or animal fats. They are found in some animal fats to a small degree, but not in sufficient quantities to nourish properly the human body.

He further states: "Fatty foods not possessing the virtue just mentioned should not, however, be discriminated against on this account when used in the ordinary liberal diet, but it would appear to be inadvisable to eliminate butter entirely from the menu, particularly that of children."

OUR SENIOR EDITOR COMPLIMENTED

The Dairy Record in an editorial has paid a splendid tribute to the Senior Editor of Hoard's Dairyman, and we take the liberty of publishing it. Our friends of many years and those of more recent years will, we believe, be interested in the movement to honor him who has devoted his life to the cause of dairy husbandry. The Record states:

"A movement is on foot to the end that the dairy industry in some appropriate manner express its appreciation of the life and work of W. D. Hoard, the grand old man of American dairying. Mr. Hoard is of Wisconsin and this honor would not be taken away from that great dairy state, but he belongs to the whole country and to each farm on which a cow is kept, and Wisconsin must not be permitted to honor him alone. It has been suggested that a statue of Mr. Hoard be erected on the campus of the University of Wisconsin within sight of the Agricultural Building, and that it be done now while Mr. Hoard is with us in the body as he always will be with us in the spirit.

"The suggestion is exceedingly appropriate and should meet a hearty response from everybody in any way connected with the dairy industry. Each one of us, no matter what our work or what our position or our business, owes all of it which is of any consequence to Mr. Hoard and his work. We do not know if American dairying would be as far advanced as it is today had we not had Mr. Hoard, but we do know that American dairying as we find it today is very largely due to his life and work.

"Just now when the world is aflame and Mr. Hoard has entered that period of life when the setting sun makes the shadows ever longer, is a fit time that a monument be erected to the man who more than any other man on this continent has contributed to the development of a peaceful industry, based on the natural law of mother love and of love for all humble and lowly things. There should be and will be a quick response to this movement."

HOW FARMING WILL DEVELOP CHARACTER IN A PEOPLE

"We are not to look for our permanent civilization to rest on any species of robber-economy. No flurry of coal-mining, or gold-fever, or rubber-collecting in the tropics, or excitement of prospecting for new finds, or even locating new lands, no ravishment of the earth or monopolistic control of its bounties will build a stable society. So is much of our economic and social fabric transitory. It is not by accident that a very distinct form of society is developing in the great farming region of the Mississippi Valley and in other comparable places; the exploiting and promoting occupancy of those lands is passing and a stable progressive development appears. We have been obsessed of the passion to cover everything at once, to skin the earth, to pass on, even when there was no necessity for so doing. It is a vast pity that this should ever have been the policy of the government in giving away great tracts of land by lottery, as if our fingers would burn if we held the lands inviolate until needed by the natural process of settlement. The people should be kept on their lands long enough to learn how to use them. But very well; we have run with the wind, we have staked the lands; now we shall be real farmers and real conquerors. Not all lands are equally good for farming, and some lands will never be good for farming, but whether in Iowa or New England or old Asia, farming may develop character in the people."—From the Holy Earth.

True enough. The qualities of thought and purpose, the unrest, the desire to move on that Dr. Bailey depreciates so much has been brought about by the constant shifting processes of our farming. There is one good thing about dairy farming and all kinds of live stock farming; it holds such communities in a much more stable condition. They are much more lasting and as a consequence more progressive in the way of farm improvement than are grain growing sections. All this means character in the people, the kind of character that builds up a state.

OUR CORN CROP AND ITS LESSON

Early this spring farmers of the northern states were concerned regarding the prospects for good seed corn. The county agent was busy trying to find corn that would grow and urging every farmer to test his seed. The immature corn crop last year and the necessity of a larger crop this year produced a situation which made it necessary to put forth extra effort to know the character of seed corn before it was planted. The intelligent procedure to overcome the shortage of good seed corn has given an exceptionally good stand of corn and at present we have a promise of a yield of over three billion bushels. If favorable weather conditions prevail we shall have one of the largest and best crops of corn ever raised.

There is a lesson in this which should not be lost. From an immature corn crop it has been possible through careful curing of the seed and by testing to secure a good stand and a promise of a good crop. In other words, through applying the right principles of selecting, curing, and testing seed corn we have a better stand than has been secured, in past years, under haphazard methods of seed corn selection from a well matured corn crop.

Our corn crop shows the tremendous possibilities of increasing the yield of all crops by proper selection of seeds. If as much attention had been given to all cereals as were given to corn there is no question but that they would have produced a larger yield. A great corn crop out of poor seed shows the value of practices which have been but recently introduced into the conduct of agriculture.

Preventing Loss of Fat

I would be pleased to know what to do with a new separator of standard make that is losing butterfat in the skimmilk. I know of one or two that are losing from .05% to .07%. They have speed indicators and appear in No. 1 condition otherwise. Milk is run through warm from the cows.

Idaho. R. W. S.

There are a number of factors which should be considered in trying to discover the difficulty with a cream separator which is not efficient. It may be that something is wrong with the machine itself, that is, that it did not come out from the factory well balanced and in condition for thorough separation. If it came to the farm in good shape, however, there are a number of things which may be looked after so that the loss of fat may be reduced:

1. Be sure that the milk is separated soon after milking so that it is still near the temperature at which it is drawn from the cow, preferably still above 90 degrees Fahrenheit.

2. See to it that the separator is run at the speed which is recommended and especially that the rate is made regular. Very frequently variation in speed has a considerable influence on a machine's efficiency.

3. Be certain that the separator is securely fastened to its foundation and that it is set up so that it is level.

4. See that the machine is fed at the right capacity. Over-feeding will frequently cause a considerable loss of fat.

5. The operating parts of the separtor should be thoroughly cleaned at least once a week with kerosene and then thoroughly oiled with a high quality lubricant.

6. At the end of the separation the machine should be flushed with skimmilk. A uniform quantity should be used at the various separations as the amount of skimmilk used may considerably influence the test of cream though this would not affect the amount of fat which may be lost in the skimmilk.

If following these suggestions does not remedy the difficulty with the separator, we recommend that the matter be taken up with the local agent of the machine.

Drying Cows Up

We have five registered Holstein heifers I am drying up, but am afraid I can't get them dry in time to feed them up as they will freshen from September 1st to October 21st. What should I do to dry them?

Owen, Wis. W. Bros.

It is a good cow which milks so persistently that it is necessary to take special measures in persuading her to go dry before freshening again. We sincerely wish that a very greatly increased number of dairy farmers might have this difficulty with their cows. The great trouble of the largest per cent of dairy farmers is to secure cows of this character and then to feed them liberally enough that they can continue to produce milk for long periods.

It should not be especially difficult to dry these heifers off. If the pasture is good it may be necessary to keep them off for a few days and feed them a restricted ration. If they are fed nothing but timothy or mixed hay for a few days, it will be an easy matter to dry them off rather quickly. At first milk only once a day and then, after three or four days, begin milking but once in two days and then again after a short time make the period between milkings even longer than this. With especially heavy milkers it may be necessary to vary this procedure slightly but in the great percentage of cases it should be easily possible to dry heifers off within ten days or two weeks after starting if the feeder is drastic in cutting down their rations.

With cows that are not producing more than ten pounds of milk per day there is very little danger of udder difficulty if milking is stopped without any preliminary change in feeding or variation in the periods between milking. The udders may be considerably distended for a few days but the milk will be absorbed and no difficulty experienced. At the University of Missouri, Professor Eckles has followed this practice for a number of years and reports only good results.

Shipping Cream vs. Marketing Butter

Owing to some difficulties I have about getting returns for my cream and getting my cans back, I have been thinking of churning my cream and shipping my butter. I want to find out all I can about whether it would pay and be a satisfactory way to market my butterfat. Would it pay to put it up in tubs and ship to commission men in Chicago, or would it be better to wrap it, give it a brand and try to sell it in larger towns? Taking it all in all, would it pay to bother with? I am getting an average of 42 or 43 cents at the present time.

Hanover, Ill. E. B. F.

The answer to the question of the practicability of making dairy butter as opposed to shipping cream cannot be a positive one, for there are many factors involved which only intimate knowledge of local conditions would permit one to speak with any authority.

In a general way the manufacture of butter on the farm is not widely followed. It has been found that under usual conditions the returns to the farmer are better when he sends his milk or cream to a creamery. Unless there is surplus labor on the farm that cannot otherwise be utilized, the cost of making a pound of butter will be greater there than in the creamery, and the sale price of this butter is not in excess of creamery butter. In fact, unless one makes an excellent article and secures a private trade, dairy butter will bring a lower price than the creamery product. It is to be remembered in making dairy butter one not only has the expense of additional equipment, but it requires time and aptitude for the work of handling the cream, making the butter, getting customers, and delivering the product. In every community, however, there are always a few men who make dairy butter and who find it profitable to do so.

If one finds it practicable to take up the extra work, doubtless he would be able to secure a good market in some one of his neighboring towns. We question very much, however, whether he would find it desirable to ship to a commission firm, unless he is manufacturing a particularly large quantity and can establish a special trade through them. Dairy butter as such will be discriminated against in the general commission markets.

Milking Test Cows by Machine

Do you know of any experiment where the milking machine was used against hand milking?

Do you think a test cow milked three times daily will do as good by machine as by hand?

Hillrose, Colo. B. W.

The successful operation of a milking machine depends very largely upon the individual taking care of it, just as is true of farm separators, gasoline engines, and other machines. We know of communities in which several makes of machines are used where they are all giving satisfaction, and are also acquainted with similar communities in which a number of men own milking machines and have been very much disappointed with them.

In the great majority of cases the fault lies largely with the operator of the machine. Any of the standard makes of milking machines, if well cared for and if used on herds of at least fifteen to twenty cows, will be found very satisfactory.

In making comparison between hand milking and machine milking, it is necessary to know the kind of hand milkers as well as to know the care which is given the machine. The general opinion of men who have had considerable experience along this line is that the milking machine is considerably better than the average hand milker, but that it is not quite so good as hand milking by careful men. A few men within our acquaintance are milking their test cows with machines and are securing very good results. In the greatest number of cases, however, test cows are milked by hand even though a machine may be used with the general herd.

Cost of Market Milk Plant

Dairymen around this city wish to co-operate in placing a plant to dispose of about 1,000 to 1,200 gallons of whole milk daily. Our present plans are pasteurizing and shipping to Chicago. We would also like to take care of cream for those that wish to sell cream. What I would like to know is what it will cost to finance a plant of this kind, also if a cheese factory would be a better way to dispose of whole milk?

Wakarusa, Ind. C. M. E.

Plant and equipment for handling 8 to 10 thousand pounds of milk daily will probably be, at present prices, anywhere between $12,000 and $18,000. Under present conditions it is safe to assume that it will cost between 3c and 4c per pound of butterfat to operate.

For city milk, pasteurized and shipped to Chicago, it will require at least three, and more likely 4, men to handle this in the right way, all depending upon whether the farmers' cans have to be washed before returning. If milk is to be bottled at the plant, it will, of course, take two extra men.

For cheesemaking purposes, if strictly Cheddar cheese or similar types are made, three men would probably be able to operate the factory.

As far as costs are concerned, it is generally considered this year that it will take from $2 to $3 for each hundred pounds of cheese to pay for labor, salt, color, bandages, etc.

As regards preference as to selling milk or manufacturing cheese, there is no question but that the market milk will pay most money in practically every instance, providing a suitable outlet can be had. There is, however, no need of going into the market milk business unless a market furnishing a steady outlet is procured before the undertaking is started. During the war especially, it is well to be so equipped that any co-operative plant is able to make either butter, cheese, handle milk or sweet cream, as the demand may require. It will cost only a slight amount more to equip a factory for all purposes and it will insure that it is always possible for the creamery so equipped to secure the highest market prices for their products.

Mogens R. Tolstrup.

Vermont Dept. of Agriculture.

Corn Bran—Husking Silage Corn

Can I afford to feed corn bran at $20 per ton? If so, in what proportion to shorts, corn and cob meal, and cottonseed meal?

Can I afford to pull off my corn and feed to hogs, from a crop that I am going to put in my silo for dairy cows?

Bell Buckle, Tenn. J. L. S.

Corn bran at $20 should be an economical purchase considering other prices. It has, however, a feeding value quite dissimilar from that of wheat bran. It contains only about one-half as much protein but is considerably higher in carbohydrates.

With the other feeds listed a mixture of 200 lbs. corn bran, 200 lbs. shorts, 300 lbs. corn and cob meal, and 150 lbs. cottonseed meal would be very satisfactory. In purchasing corn bran its quality should be ascertained, making sure that it is above 65 per cent in its total digestible nutrients.

The question raised concerning husking corn which is to be used for silage is one about which a great many men have concerned themselves. We have had considerable experience with the feeding of silage and have come to the firm belief that no field of corn is too valuable to be put into a silo ears and all.

We advise, therefore, that instead of husking corn before putting it into the silo that silage be made of it as it comes from the field. We are confident that the results secured in milk production will very well pay for all of the grain which is thus included in the silage mixture.

Production Comparisons

I am milking 60 grade cows, some Jerseys, some Holstein and Jersey, and some Shorthorns. Ten of these cows were strippers and will freshen this fall, the rest coming fresh alternately from the last of February to the 10th of June. For the past 30 days I have averaged 15 to 18 lbs. of milk per day. Is this a fair average for a grade herd?

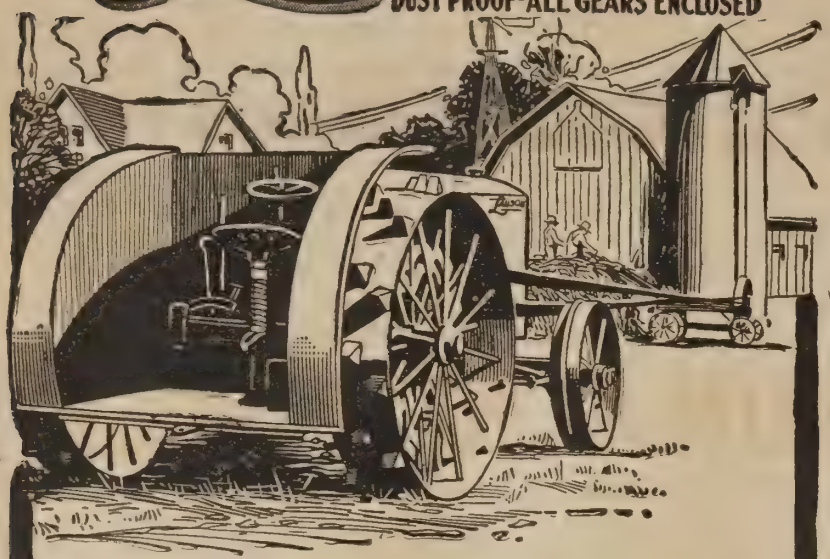
Bristol, Tenn. R. H. S.

If the 15 to 18 lbs. per day is the average for the entire herd, including dry cows, it would indicate a yearly production of milk of from 5,500 lbs. to 6,500 lbs. This production would be above the average for the country but it is not high enough to warrant complete satisfaction with the results. It is also somewhat doubtful whether our computations apply and the presumption is that their annual production is somewhat less than indicated.

We have before us the record of a herd of seven grade Holstein and scrub cows that average 5,248 lbs. of milk containing 195 lbs. fat. In cow testing associations, the general average will run considerably in excess of this and from a report from one association, we find the lowest herd has an average annual production of 4,034 lbs. milk containing 181 lbs. fat, whereas the highest herd average is 9,785 lbs. milk containing 383 lbs. fat. There are only two herds in this association that produced less than 200 lbs. of fat and the general average for the entire 24 herds is slightly over 275 lbs. fat.

Butter From One Pound Fat

Will you please tell us how many pounds of butter we should get from 37 lbs. of cream testing 35 per cent of fat?



Niles, Mich. M. Bros.

Thirty-seven pounds of cream testing 35 per cent butterfat contains 12.95 pounds of butterfat.

Theoretically a pound of butter can be made from each eight-tenths of a pound of butterfat. On such a basis it would be possible to make 16.2 pounds of butter from the 12.95 pounds fat. However, because of losses in churning and also because the overrun cannot be exactly controlled, somewhat less than 16.2 pounds of butter would likely be secured. If fifteen pounds of butter can be printed from this amount of fat very efficient work is done.

The LAUSON 15-25

DUST PROOF-ALL GEARS ENCLOSED

For Plowing and Belt Work

Most tractors are measured by their ability to *plow*. Field work is only *half* the work. Lauson farmer owners now look upon the Lawson 15-25 as a *power unit* for doing all the heavy work on the farm.

—for plowing, discing and seeding.
—for keeping up the country roads. pulling grader and running crusher.
—for running the silo cutter, hay baler or grain separator.

Lauson tractors are bought on performance and reputation. Send for complete information and specifications. Very often the *saving* pays for the Lauson in one season.

Builders of Lauson Frost King Engines

For 23 years Lauson Frost King Engines have been the standard of farm engine excellence—built in 2½ to 50 H. P. sizes.

THE JOHN LAUSON MFG. CO., 527 Monroe St., New Holstein, Wis.

WE FED YOUR COWS

TRADE UNICORN MARK

¶ Almost every high American record for fourteen years with any breed was made with our Ajax Flakes as an important base of the grain ration.

¶ Unicorn Dairy Ration is the only feed that contains Ajax Flakes.

¶ You can hardly find a pure blood whose maternal ancestors were not fed on Ajax Flakes or Unicorn Dairy Ration.

¶ Unicorn is recognized as a safe, efficient and economical dairy feed.

¶ Unicorn during the past year made more high records than any other brand of feed.

¶ Unicorn really costs less per pound of milk or fat produced than other feeds.

Chapin & Co., Dept. Z, Chicago

KING SEGIS PATENT LOCK

Ear Tags, Bull Staff and Rings. Description and prices sent on application. 300,000 of these ear tags have been sold without adverse criticism. 500 of these BullStaffs are used by the best breeders in the business.

H. A. Meyer, Syracuse, N. Y

Get ¼ to ⅓ More Silage

into your silo — quicker, easier. The HOOSIER SILO EXTENSION ROOF insures a full silo even after silage settles; no refilling needed. Strong. Economical, Permanent; attaches to any silo. Fire and rust proof. Easy to put on, and open or close. Guaranteed. Pays for itself in a season. Send for catalog.

Association Notes

Stillaguamish, Washington: — In June 143 of our cows produced more than 40 pounds fat each. Forty-eight of them produced more than 50 pounds each. Eight poor cows were sent to the block. An increased care is being exerted in discovering the other low producers in the association. Several members are using soiling crops this season and are finding them very profitable. In June the condensery paid $2.15 per hundred pounds for milk testing 3.7 to 4 per cent. The creamery paid 48c for fat and the cheese factory an equal price. Milk retails for 11c and butter for 45c. Bran costs $34 per ton; shorts, $36; alfalfa hay, $28; and oats, $70.

Lake County No. 2, Illinois:—In June only four cows were sold for being unprofitable. Seven pure-breds were purchased, all Holsteins. Since February 40 head have been brought into this association. Two-thirds of the herds are being fed on pasture alone. The June price for milk testing 3.5 per cent is $1.80 per hundred pounds. International Dairy Ration costs $52 per ton; Planters Dairy Ration, $48; oil meal, $65; and American Milling Company Feed, $50.

Eastern Bradford, Pennsylvania:—The May price for 3 per cent milk here was $2.40 per hundred pounds. The creamery paid 47½c for fat. Cottonseed meal retails for $3.10 per hundred pounds; gluten, $2.85; buckwheat feed, $2.40; wheat middlings, $2.70; wheat bran, $2.25; and Union Grains, $2.80.

Jo Daviess County, Illinois:—The June price for milk here was $1.90 per hundred pounds. The creamery paid 45c for fat and retailed butter for 50c. Very few cows in the association are receiving any grain. The only feed being supplied is pasture which costs $2 per month per cow.

Burnett County No. 1, Wisconsin:—Two bull associations have been organized in this territory. A barrel of fly repellant has been purchased at 50c per gallon. Six or eight culled cows were sold during the month. Orders have been secured for three carloads of bran, one of cottonseed meal, and possibly one or two of clover and alfalfa. The creamery pays 45c per pound for fat and retails butter for 42c. Bran costs $1.90 per hundred pounds at the mill; shorts $2; oil meal, $3.10; oats, 68c per bushel; and hay is not to be purchased.

Ft. Atkinson, Wisconsin:—Several of our members are feeding grain along with pasture. Very little silage is left from last season for summer feeding. Most of the bulls being used in the association are not only pure-bred but are from high producing dams. Milk testing 3.5 per cent sold in June for $1.80 per hundred pounds. Creamery pays 47c for fat. Milk retails for 10c and butter for 48c. We put the following values on feeds here: silage, $6 per ton; mixed grain, $50; hay, $20 to $25; and pasture, $2 per month per cow.

Duvall, Washington:—The condensery paid for the month of June $2.15 per hundred pounds for milk testing 3.7 to 4%. The creamery paid 47c to 49c for fat. Milk retails for 10c. Shorts costs $36 per ton; bran, $34; Fishers Dairy Feed, $48; alfalfa, $26; and pasture, $3 to $4 per cow per month.

Arkansas Valley, Colorado:—Our main trouble in this association is that the farmers are more interested in the crops than in their dairy herds. For this reason very few changes are being made just now in improving the herds. The condensery paid $2.20 per hundred pounds for June milk which tested 3.5 per cent. Milk retails for 12c per quart. Feed was valued as follows: corn chop, $3.15 per hundred pounds; bran, $1.75; cottonseed meal, $3; shorts, $1.85; beet pulp, $2; silage, $8 per ton; and new alfalfa, $10 per ton.

Wilson County, Tennessee:—The May price for butterfat was 45c per pound. Our members are paying $2.25 per hundred pounds for velvet bean meal and $2.85 for cotton seed meal.

Johnstown, Colorado:—Our members are taking advantage of the high price of beef and weeding out many poor cows. In this way we have increased the average production considerably. One splendid herd bull was purchased by two of our members the past month. Milk sells here mainly by the gallon, a price of 25c being secured. The condensery paid 55c for fat in May. The retail price of milk was 12½c and butter 50c. Alfalfa hay is selling at $16 per ton; silage, $7; dried beet pulp, $22.50; bran, $36; corn, $64; gluten, $65; oil meal, $80; and oats, $69.

Arkansas Valley, Kansas:—Two bulls with extra good breeding have recently been purchased for the association. The June price for milk testing 3.5 per cent was $2.75 per hundred pounds and 25c per gallon. The condensery paid $2.20 per hundred pounds for milk with the same test while the creamery paid 42c per pound fat. Milk retails for 10c to 12½c and butter for 45c. Local prices for feeds are: alfalfa hay, $10; silage, $4; bran, $35; corn chop, $65; oil meal, $68; shorts, $45; cottonseed meal, $68; ground oats, $55; and pasture, $1.50 per cow per month.

First Lake County, Illinois:—Some pure-bred stock has been brought into the association during the past month. Members receive the price of $1.80 per hundred pounds for milk testing 3.5 per cent. The creamery paid 46c for fat last month. Cost of pasturing cows is $1.50 per month. Grain Gold costs $56 per ton; cottonseed meal, $64; ground oats, $49; and silage, $6.

Cashe Valley, Utah:—Five cows were sold in June for beef. The highest testing herd in the association is owned by John T. Darley and consists of 19 grade Jerseys which averaged a production of 1,032 pounds milk con-

taining 48 pounds fat. Pasture is the main feed in this section at this time. Its value is greatly increased when a change can be made about every ten days. A charge of $3 per cow per month is made for it. The work of the association is going on very successfully.

Walla Walla, Washington:—The following table gives a comparison from our association for the past three years, for the month of June:

	1916	1917	1918
Number of cows tested	447	465	455
Average milk per cow	524	609	635

The increase in milk production in two years is 111 pounds of milk per cow. During the past month 515 cows were tested for tuberculosis in the valley and only two reactors were found. That is, the herds averaged a test of 99.6 per cent freedom from tuberculosis. In both cases where the re-actors were found, the cows were apparently in the best of health and were among the highest producers in the herd. June 12th a meeting for the organization of a Jersey Bull Association was held . The county agent is writing to Jersey breeders for prices of bulls which will be suitable for this association.

Food Administration Review

The following is from a letter written July 11 by Food Administrator Hoover to President Wilson:

It is now possible to summarize the shipments of foodstuffs from the United States to the Allied countries during the fiscal year just closed—practically the last harvest year. These amounts include all shipments to Allied countries for their and our armies, the civilian population, the Belgian Relief, and Red Cross. The figures indicate the measure of effort of the American people in support of Allied food supplies.

The total value of these food shipments which were in the main purchased through, or with the collaboration of, the Food Administration, amount to, roundly, $1,400,000,000 during the fiscal year.

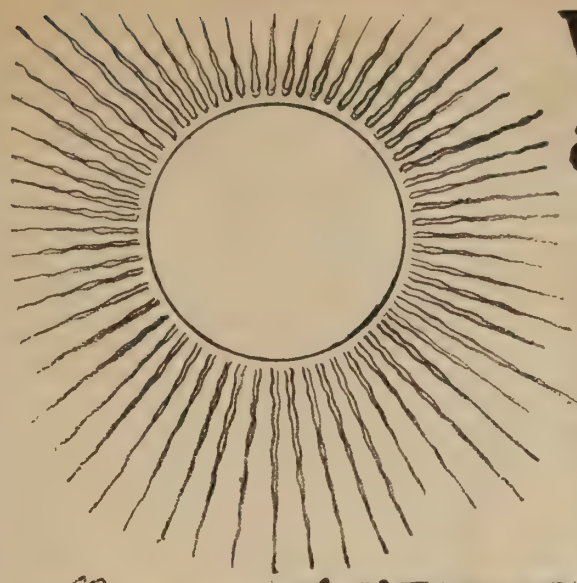
The shipments of meats and fats (includes meat products, dairy products, vegetable oils, etc.,) to Allied destinations were as follows:

Fiscal year 1916-17	2,166,500,000 lbs.
Fiscal year 1917-18	3,011,100,000 lbs.
Increase	844,600,000 lbs.

Our slaughterable animals at the beginning of the last fiscal year were not appreciably larger than the year before, particularly in hogs; they were probably less. The increase in shipments is due to conservation and the extra weight of animals added by our farmers. The full effect of these efforts began to bear their best results in the last half of the fiscal year when the exports to the Allies were 2,133,100,000 lbs., as against 1,266,-500,000 lbs. in the same period of the year before. This compares with an average of 801,000,000 lbs. of total exports for the same half years in the three-year pre-war period.

In cereals and cereal products reduced to terms of cereal bushels, our shipments to Allied destinations have been:

Fiscal year 1916-17	259,900,000 bushels
Fiscal year 1917-18	340,800,000 bushels
Increase	80,900,000 bushels



Of these cereals our shipments of the prime breadstuffs in the fiscal year 1917-18 to Allied destinations were, wheat 131,000,000 bushels, and of rye 13,900,000 bushels, a total of 144,900,000 bushels.

The exports to Allied destinations during the fiscal year 1916-17 were, wheat 135,100,000 bushels and rye 2,300,000 bushels, a total of 137,-400,000 bushels. In addition, some 10,000,000 bushels of 1917 wheat are now in port for Allied destinations or en route thereto. The total shipments to Allied countries from our last harvest of wheat will be, therefore, about 141,000,000 bushels, or, a total of 154,900,000 bushels of prime breadstuffs. In addition to this we have shipped some 10,000,000 bushels to neutrals dependent upon us and we have received some imports from other quarters. A large part of the other cereals exported have also gone into war bread.

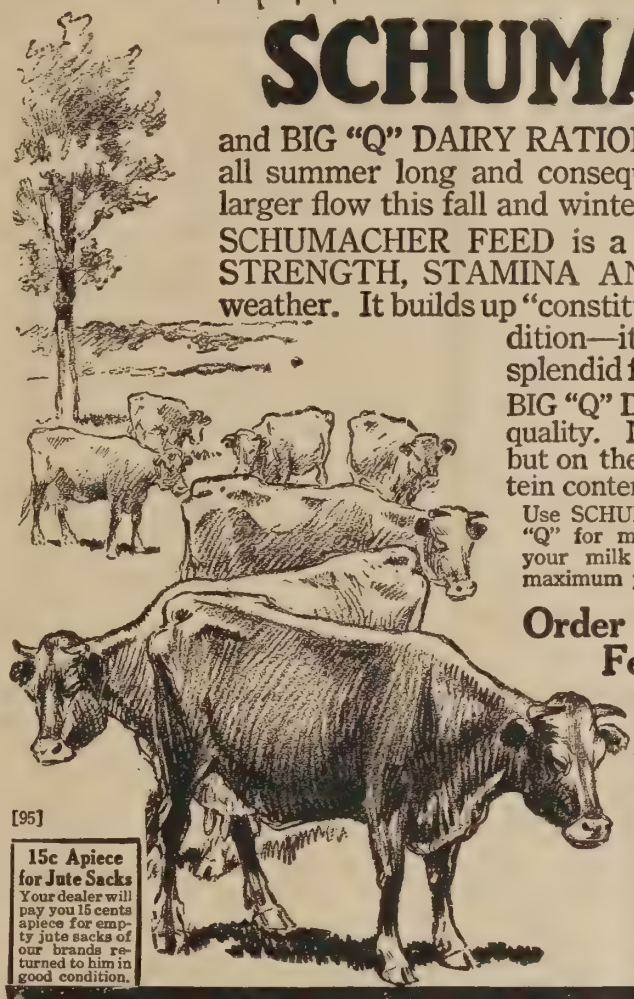
It is interesting to note that since the urgent request of the Allied Food Controllers early in the year for a further shipment of 75,000,000 bushels from our 1917 wheat than originally planned, we shall have shipped to Europe or have enroute, nearly 85,000,000 bushels. At the time of this request our surplus was already more than exhausted. This accomplishment of our people in this matter stands out even more clearly if we bear in mind that we had available in the fiscal year 1916-17 from net carry-over and as surplus over our normal consumption about 200,000,-000 bushels of wheat which we were able to export that year without trenching on our home loaf. This last year, however, owing to the large failure of the 1917 wheat crop, we had available from net carry-over and production and imports, only just about our normal consumption. Therefore our wheat shipments to Allied destinations represent approximately savings from our own wheat bread.

These figures, however, do not fully

(Continued on page 19)

When days are hot and Pastures short

—and your cows spend most of the day under the trees, unless you supplement their scant pasturage with a feed that will offset these hot weather conditions, a SHRINKAGE IN YOUR MILK CHECKS is bound to follow.



Cows that are well nourished in the summer will keep up their milk flow during the hot months and will also respond with a greater milk yield in fall and winter than cows that are forced to depend for their summer feed on short, dried up pasturage.

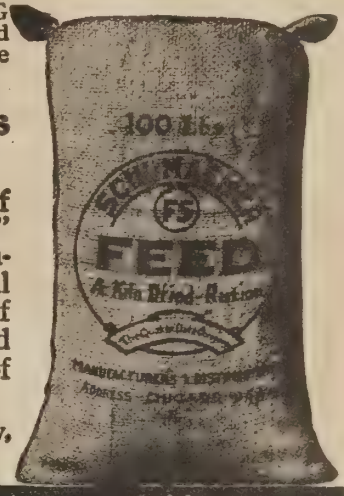
SCHUMACHER FEED

and BIG "Q" DAIRY RATION will keep your cows up to NORMAL FLOW all summer long and consequently put them in condition to give you a larger flow this fall and winter than ever before.

SCHUMACHER FEED is a grain ration which supplies the ENERGY, STRENGTH, STAMINA AND ENDURANCE so much needed in hot weather. It builds up "constitutional" powers—keeps cows in the finest condition—it's the dairymen's "old reliable," being also a splendid feed for dry cows, young stock, horses and hogs.

BIG "Q" DAIRY RATION is a protein ration of the highest quality. Not made on the old "high per cent" protein fallacy, but on the more modern idea of "highest quality" of protein content.

[95]



15c Apiece for Jute Sacks
Your dealer will pay you 15 cents apiece for empty jute sacks of our brands returned to him in good condition.

Use SCHUMACHER for condition—BIG "Q" for milk—feed them liberally and your milk checks will stay up at the maximum point.

Order Fall and Winter's Feed—NOW!

Put in your supply of Schumacher and Big "Q" now for the same reason you order your coal—to protect yourself against a possible feed shortage as a result of shipping difficulties.

If your dealer can't supply, write us.

Sure Death to Hog Worms.

At last there is a hog worm remedy that is absolutely positive.

Bonnett's "Big B" Worm Capsules

are now used by Agricultural Schools, Farm Advisers, Veterinaries and leading hog raisers. Absolutely sure and quick in its action. Each hog gets just the proper dose to expel the worms and put it in fine condition to make the most weight out of every pound of feed. Breeder's Gazette recently had an article on its great popularity. Nothing else like it. One capsule does the work. Satisfaction guaranteed. "Big B" Worm Capsules $5 per 100. Pig Gun and Speculum $7.50. All charges prepaid. Order today.

CUT OFF MORE CORN THIS YEAR

Thirty per cent of the feeding value of your corn crop is in the stalks. This fact is based on exhaustive tests made by the best agricultural authorities. Yet thousands of acres of corn stalks are practically wasted every year by field feeding—a loss that amounts to an enormous sum.

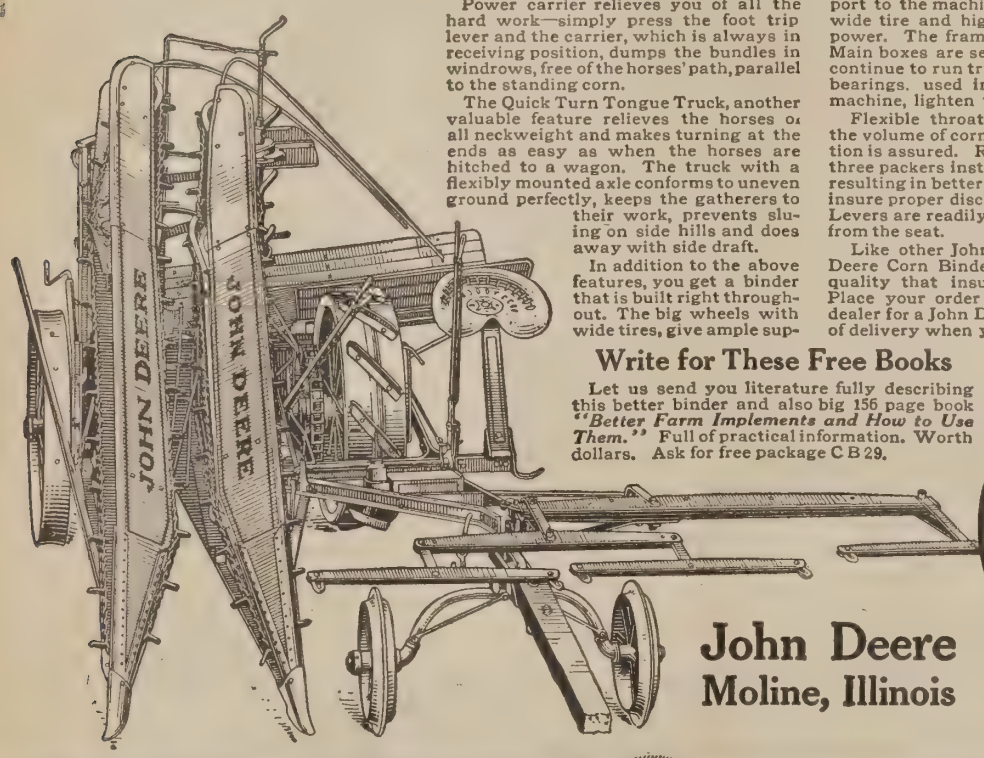
Cut more corn this year. You will increase your net profits whether you cut the green corn for the silo, whether you shred and store the fodder, or whether you feed the whole stalk in the feed lot. You can cut more corn, at the right time, if you use the

JOHN DEERE CORN BINDER

The Binder with the Power Carrier and Quick Turn Tongue Truck

You can cut corn more timely, you can cut it five to seven times as fast as by hand: you can help solve the present shortage of farm labor by cutting your corn with a John Deere Corn Binder. In addition to its labor saving features, its better, more lasting construction and its many operating advantages will have a particular appeal to you.

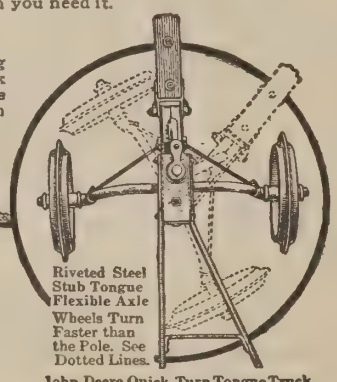
These Features Save You and Your Horses



Power carrier relieves you of all the hard work—simply press the foot trip lever and the carrier, which is always in receiving position, dumps the bundles in windrows, free of the horses' path, parallel to the standing corn.

The Quick Turn Tongue Truck, another valuable feature relieves the horses of all neckweight and makes turning at the ends as easy as when the horses are hitched to a wagon. The truck with a flexibly mounted axle conforms to uneven ground perfectly, keeps the gatherers to their work, prevents sluing on side hills and does away with side draft.

In addition to the above features, you get a binder that is built right throughout. The big wheels with wide tires, give ample support to the machine. The big drive wheel with wide tire and high lugs, has plenty of driving power. The frame is strong and rigidly built. Main boxes are self-aligning—the working parts continue to run true. Seventeen roller and ball-bearings, used in all important parts of the machine, lighten the draft.



Flexible throat springs adjust themselves to the volume of corn—continuous and even elevation is assured. Regular binder attachment has three packers instead of two, as commonly used, resulting in better bundles. Four discharge arms insure proper discharge of bundles onto carrier. Levers are readily accessible and easily operated from the seat.

Like other John Deere Implements, the John Deere Corn Binder is built on the standard of quality that insures service and satisfaction. Place your order early with your John Deere dealer for a John Deere Corn Binder. Be assured of delivery when you need it.

Write for These Free Books

Let us send you literature fully describing this better binder and also big 156 page book *"Better Farm Implements and How to Use Them."* Full of practical information. Worth dollars. Ask for free package C B 29.

Infectious Abortion

The Connecticut Station bulletin 93, recently published, contains valuable information on infectious abortion in cattle. It reports sufficient experimental work to give its remarks considerable weight. The disease was studied in three herds of 60 to 100 animals, two herds for about three years, and one for one year. L. F. Rettger, Yale University, and G. C. White, Storrs, are the authors of the bulletin.

The agglutination and complement fixation tests proved efficient indicators of an animal's infection or freedom from the abortion disease and were highly valuable, therefore, in putting into use measures for cleaning abortion from the herds.

Heifers and young cows were found to be more susceptible to the disease than older animals. At birth, calves react to the test if their dams are infected; or, if the dams are healthy, no reaction is evidenced. Calves from six months to nine to ten months of age did not react and were thought to be free from infection. At nine to ten months heifers are particularly liable to become infected. This period of high susceptibility lasts up to about 3 years of age.

When an adult animal once has the disease the Connecticut figures show that the infection is very likely to be permanent.

Bulls may be permanently diseased, but the percentage among bulls is probably lower than among females. As with heifers, permanent infection of bulls comes after they are nine or ten months old.

In the herds studied, heifers which were dropped by cows infected by the organism of abortion were no more apt to have the disease at maturity than were those whose dams had always been free from the disease.

The two most likely means of infection with the organism causing abortion appeared to be through service by a sire carrying the B. abortus and through eating food contaminated by the organism.

The following are among the recommendations made by the authors to prevent the spread of the disease:

All of the maturing and adult animals of the herd should be subjected to at least the agglutination test, and a complete record of the laboratory diagnosis kept.

In so far as it is practicable, reacting animals should be kept away from the non-reactors, and, as soon as it is feasible to do so without involving too great financial loss, the former should be disposed of.

Whenever possible, a non-reacting bull should be employed exclusively for the service of non-reacting heifers and cows. And even with this precaution it is very important that the sheath of the male be disinfected before and after service, in order to protect the sound animals against infection from cows which may be infected and by chance have escaped detection. This latter precaution is especially desirable when a large proportion of the general herd has responded positively to the test, but should not be neglected even when but few carriers are apprehended or suspected. When it is economically impossible to employ more than one bull, the effective disinfection of the sheath of the male is absolutely essential. The same agent and method of disinfection may be employed as suggested for cows.

As the organism of infectious abortion is eliminated in large numbers in the vaginal secretions of infected cows, especially after calving, these secretions must be rendered harmless by burning, deep burial, or by some equally effective disinfectant. An aborted fetus and the afterbirth should receive the same treatment.

The soiled parts of the aborting animal should be thoroughly disinfected at least daily until there are no more secretions. A mild antiseptic vaginal wash is of considerable importance, also. A warm solution of permanganate of potassium (1 to 1,000) or a 1% lysol or cresol solution may be used for this purpose. A funnel and douching tube are necessary, or an injection pump, if carefully used, is good. Douching should be continued as long as discharges are apparent and as often as once in two days at first. Twice weekly is sufficient later in ordinary cases. No attempt should be made to disinfect the uterus, except by a trained veterinarian.

Cows which have aborted should not be bred for at least eight weeks after they have aborted. When no discharge is apparent longer delays are not advisable on account of the financial loss incurred by having the cows dry.

It is important that all rules of cleanliness and sanitation be observed; this applies particularly to the frequent removal of bedding, forage, and manure from the stable, and

to the safeguarding of food and water against undue and unnecessary contamination by the animal's discharges.

If milk is fed long to the young stock it is urged that only the milk from negative cows, or pasteurized milk, be fed after the sixth month. The same precaution should be taken with all other feed.

Extreme precaution should at all times be exercised in the purchase of new animals. Unless newly acquired heifers or cows are known to have come from abortion-free herds, they should be suspected as being carriers until they are shown to be free from taint. Breeders will be forced to realize that the safest procedure in the successful re-stocking and building up of the dairy herd will depend on careful and intelligent breeding, and on the selection and rearing of their own calves as future breeders and producers. Whenever purchases are absolutely necessary it will be far safer to buy calves under seven months old, and to protect them against future infection, than to purchase heifers or fully mature cows which may or may not be carriers at the time of purchase.

Great care should be exercised, also, in the loaning of the herd bull for service of cows from without the herd. This practice involves a risk which the owner of a valuable herd cannot afford to assume. When for most urgent reasons it is permitted, careful disinfection of the male before and after service should never be neglected.

Large Herds Most Profitable

Who makes more profit, the man with a few cows or the one with a large herd? On a "per cow" basis, can as much money be made with ten or a dozen cows as with three or four times as many? John A. Hopkins, Jr., of the Delaware Experiment Station says not. He bases his statement on a study of eighty-seven dairies in Delaware and Pennsylvania. The data collected and published in Bulletin No. 118 of the Delaware Station clearly indicate that under conditions prevalent where the statistics were gathered, the big "cow man" not only realizes larger total net returns than the owner of a small herd but also a larger profit per cow.

The 87 dairies were divided into 9 classes, according to the number of cows, from those with less than 10 to herds of 75 to 100. Then a careful study was made of the conditions effecting the returns from the cows in each class. Among the factors considered were interest, depreciation, value of cows, pasturage, cost of grains and forage, labor, cost of management, and credit for manure and calf. The data showed the wisdom of having good cows, comfortably though not expensively housed, and fed wisely. The following is the summary Mr. Hopkins makes of his findings:

The superior productiveness of larger dairies was found to be caused, in part at least, by the better type of cows which they kept. The cows were usually, though not necessarily, of higher grade, but were more productive individually; and their superior production was seen to go with greater intelligence in selection, feeding, and care. This was incident to the specialization of the larger dairies.

The investment per cow in dairies producing the same grade of milk decreased as the size of the dairy increased.

There was no considerable variation in amount of feed used in the different classes, but the larger dairies were able to buy feeds more cheaply by buying in large quantities.

The cost, per cow, for hauling milk decreased as size of dairy increased up to forty cows, then increased slightly as the addition of another horse became necessary; then decreased again as size of dairy increased.

Cost of bull service, per cow, decreased as size of dairy increased up to forty cows, then increased slightly as a second bull was added, then increased again as a third bull was added in dairies of over eighty cows.

The amount of labor required per cow decreased as size of dairy increased until the dairy reached the size of twenty cows, then remained practically constant for dairies producing like grades of milk.

Cost of supervision increased slightly with the size of dairy. However, this added expense was more than offset by greater intelligence of management.

Measured by profit, the efficiency of the dairies increased with their size with the exception of Class II, which was the least profitable class.

The cost per quart for the production of market milk decreased as the size of dairy increased.

The larger dairies produced a higher grade of product than the smaller ones and disposed of it at a higher and better price.

Wetproof Steel Lined Shot Shells

A WET day is indeed a good day for ducks to the hunter who has the *right* shotshells in his pockets. Remington UMC Smokeless "Arrow" and "Nitro Club" Wetproof Shotshells do not require fair weather to keep in good condition and work *right* through the gun. They may be exposed to wet for hours but will not soak through—the water can not get in, can not swell them, soften the turned-over end or bulge the top wad. Mauling them around in the wettest coat pocket can not scuff them. Remington UMC makes them *right*.

This is something every farmer who loves duck hunting will learn with profit—it will make those idle wet days in the Fall welcome ones.

Remington UMC for Shooting Right

The result is virtually a new type of shell, embodying the most important improvement in shotshell manufacture in over a decade.

These are the first *completely* wetproof shotshells—an exclusive feature of the Remington UMC "Arrow" and "Nitro Club" brands for shooting *right*.

You just buy the same old favorite Remington UMC "Arrow" or "Nitro Club" Steel Lined Speed Shells, at the regular price, and you get the new Wetproof feature thrown in besides. A shell that is sure fire, gives top speed, best pattern and most penetration, and has in addition the wonderful quality of staying dry as dust inside and hard and smooth as glass outside even when subjected to the wettest weather conditions.

It took three years to perfect this waterproofing process. Special paper had to be produced for the shell bodies, a special formula discovered for compounding the *right* combinations of waxes and oils, new machinery developed for applying the waterproofing so as to work it *into* the shell as a part of it, positively sealing it against hours of wet, and new methods devised for giving the shell the same *right* finish as before.

In *black powder*, buy the old reliable "New Club," now Wetproof sealed at turnover and top wad.

125 Head of Registered Holsteins

of both sexes and all ages.

The Purebred Live Stock Sales Co., of Brattleboro, Vermont, Inc.

FOR SALE

One Hundred High Grade Heavy Springing

Holstein Cows

And Heifers, Quality Good

Also 18 Registered Heifers

Bred to son of Tidy Abbekerk Prince

J. A. KNORR, Blanchardville, Wis.

Whatever the amount of milk or butterfat

you wish to produce, is it not better policy to use large-yield cows than to feed and shelter the necessarily greater number of small-yield cows?

Use Holsteins and you save labor, feed, stableroom, equipment and risk. They are always healthy and ready for work.

Choose cows according to their capacity for converting cearse feed into milk. That is the function of a dairy cow and that is where the big Holstein excels.

HOLSTEIN-FRIESIAN ASSOCIATION OF AMERICA, Box 101, Brattleboro, Vt.

GRANDDAUGHTER OF NOBLE OF OAKLANDS

Sire: Trial's Noble of Oaklands whose dam made 563 lbs. fat in one year. Dam: May of Oak Grove that has a R. M. record of 334.41 lbs. fat as a 2-year-old—ave. test 6.2%. Born April 1917. Bred to an R. M. son of Eagle's Chief. Also a bull calf by the same sire from a heifer that made 594.625 lbs. fat as a jr. 2-year-old and won first at Wis. State Fair 1915. Dropped Jan. 16, '18. Guaranteed straight and right.

Oak Grove Jersey Farm, Wm. M. Knight, Eagle, Wis.

FOR SALE

My Entire Herd of

30 Registered Guernseys

including herd bull Lohier's Raider of Waddington. Several cows of good A. R. Records.

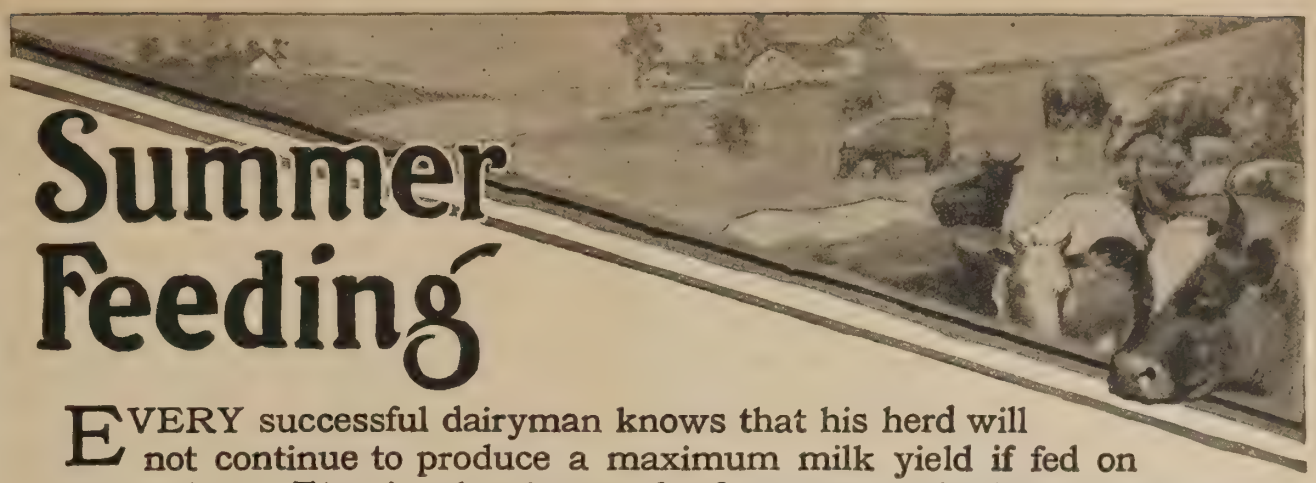
Joe Speidel, Jr., Jobetty Farm, Elm Grove, W. Va.

Food Administration Review

(Continued from page 15)

convey the volume of the effort and sacrifice made during the past year by the whole American people. Despite the magnificent effort of our agricultural population in planting a much increased acreage in 1917, not only was there a very large failure in wheat, but, also, the corn failed to mature properly and corn is our dominant crop. We calculate that the total nutritional production of the country for the fiscal year just closed was between 7 per cent and 9 per cent below the average of the three previous years, our nutritional surplus for export in those years being about the same amount as the shrinkage last year. Therefore, the consumption and waste in food have been greatly reduced in every direction during the year.

I am sure that all the millions of our people, agricultural as well as urban, who have contributed to these results should feel a very definite satisfation that in a year of universal food shortages in the northern hemisphere all of those people joined together against Germany have come through into sight of the coming harvest not only with health and strength fully maintained, but with only temporary periods of hardship. The European Allies have been compelled to sacrifice more than our own people but we have not failed to load every steamer since the delays of the storm months last winter. Our contributions to this end could not have been accomplished without effort and sacrifice and it is a matter for further satisfaction that it has been accomplished voluntarily and individually. It is difficult to distinguish between various sections of our people—the homes, public eating places, food trades, urban or agricultural populations—in assessing credit for these results but no one will deny the dominant part of the American women.



New York Butter Market

NEW YORK CITY, JULY 17:—With the exception of one day, the past week has been a very active one in the New York market. Speculative buying has been at its height because of the high quality of the butter that has been received. Local consumption of butter has been higher than usual at this time of the year, which is probably due to two causes, viz., prevailing cool weather and war conditions, both of which have tended to keep many in town who otherwise would be enjoying vacations in the country.

On the whole the active market has been due to local buying as very little butter has been sold for deliveries to outside towns, the government has purchased practically none and none has been sent to the allies. Yesterday the local contract for butter to be delivered to the Navy during August was given which acted to further strengthen the market. There is a feeling that butter will fluctuate in price considerably during the year because of a shortage of refrigerated cars which will tend to cause the receipts of butter to vary largely from day to day thus greatly affecting the factor of available supply.

The prevailing price of extras (92 score butter) for the week has been 45c. Yesterday, however, there was an advance of ¼c on all grades of butter, extras closing firm at 45¼c. Other quotations were as follows: Higher scoring than extras (93 score butter or above), 45¾@46¼c; firsts, (88 to 91 score butter), 43½@44¾c; and seconds (83 to 87 score butter), 40½@43c.

New York. W. B. LIVERANCE.

Summer Feeding

EVERY successful dairyman knows that his herd will not continue to produce a maximum milk yield if fed on grass alone. That is why thousands of prosperous feeders all over the country who know how to feed for results, are using Krause Dairy Feed, twelve months in the year—are depending upon it for a large part of their summer as well as their winter rationing.

Krause Dairy Feed

Krause Dairy Feed is an exceptional all-year-round feed because it is composed of nine of the best milk producing feed stuffs on the market, carefully and scientifically proportioned to secure a balanced ration containing a protein content of 24% to 25%. It contains Distillers Grains, Gluten Feed, Cotton Seed Meal, Wheat Bran, Malt Sprouts, Wheat Middlings, Brewers Grains, Hominy Feed, Linseed Meal and a small percentage of salt.

Fed alone or mixed with home grown grains when a lower protein content is desired, Krause Dairy Feed can always be depended upon for a high grade milk making ration which never varies in quality. Each ingredient in it is valuable in itself and its value increased by the variety of other materials with which it is combined. Krause Dairy Feed is more than a balanced ration; it is a standardized ration that can be adapted to meet the feeding requirements of any section of the country in which it is used.

No shrewd business farmer is spending the time to mix his own feed when he can ecure a ready mixed ration like Krause Dairy Feed that is chemically correct, and as been proved by thousands of expert dairymen to be economical, profitable and dependable.

A fair trial of Krause Dairy Feed will convince you that your herd will thrive on it, increase its milk yield and pay big returns on the investment. Order Krause Dairy Feed from your dealer today. If he cannot supply you immediately, give us his name and we will see that you get it without delay.

Plumb Stays at Ohio

The following statement is made by Dean Alfred Vivian of Ohio University:

Professor C. S. Plumb of the Ohio State University College of Agriculture has consented to withdraw his resignation recently announced and to continue his services as head of the Department of Animal Husbandry at the university. The decision of Professor Plumb to remain at the head of this department is received with considerable satisfaction by his friends and those interested in the development of animal husbandry in the state.

Professor Plumb had expected to retire from teaching and to give his entire time to writing on animal husbandry subjects and to the revision of some of his works. Arrangements have been made which will make it possible for him to do this work without entirely abandoning his teaching.

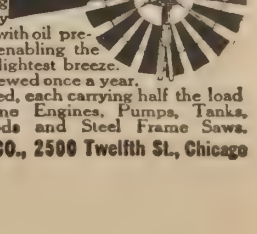
Defend the "bread line" with eternal vigilance—our men are risking their lives to hold it.

A Better Way of Sealing Preserves, etc.

In putting up preserves, catsups, chow-chow, chili-sauce, berries, Indian Relish, etc., don't follow the troublesome paraffine wax method of closure.

The better and easier way is to use a MIDGET CROWNER and seal your bottles (up to 14 ins. in height and 4 ins. in diameter) with air tight Crowns (3 sizes).

In storing condiments of all kinds for future use you will find this the safest method of sealing.



Write for full particulars.

THE CROWN CORK AND SEAL COMPANY,
Baltimore, U. S. A.

CORN HARVESTER Self Gathering for cutting Corn, Cane and Kaffir Corn. Cuts and throws in piles on harvester. Man and horse cuts and shocks equal to a Corn Binder. Sold in every state. Price only $25 with fodder binder. The only self gathering corn harvester on the market, that is giving universal satisfaction.—Dexter L. Woodward, Sandy Creek, N. Y., writes: "3 years ago I purchased your Corn Harvester. Would not take 4 times the price of the machine if I could not get another one." Clarence F. Huggins, Speermore, Okla.: "Works 5 times better than I expected. Saved $40 in labor this fall." Roy Apple, Farmersville, Ohio: "I have used a corn shocker, corn binder and 2 rowed machines, but your machine beats them all and takes less twine of any machine I have ever used." John F. Haag, Mayfield, Oklahoma: "Your harvester gave good satisfaction while using filling our Silo." K. F. Ruegnitz, Otis, Colo.: "Just received a letter from my father saying he received the corn binder and he is cutting corn and cane now. Says it works fine and that I can sell lots of them next year." Write for free catalog showing picture of harvester at work and testimonials.
PROCESS MFG. CO., Salina, Kansas.

THE SELF-OILING WINDMILL

has become so popular in its first three years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load

We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

THE FAIRVIEW PIG CLUB

[Continued from last week]

THE great day dawned at last. Apparently it was like any other bright day in early September but to the two Barret boys and at least eight others from the Fairview school it was something more than that. It was the big day of the season for them because today their pigs were to be judged at the county fair. The amount of gain for the season or the cost of that gain did not enter into the day's contest at all, it was simply a question of which pig was the best.

The day before the two boys had taken their pigs to the fair grounds and this morning they were both up with the sun, in a hurry to be through with their regular work so that they could get their charges ready for the competition.

"Come on, George, get a move on," shouted Dick. "You feed the calves while I rustle these cows out to the wood lot. Then as soon as we get breakfast we can beat it."

George merely grunted a reply. He wasn't wasting any time talking but he was hustling and to such a good purpose that when Dick came back from the pasture, he found his brother already seated at the breakfast table.

"You boys got them chores all done already?" inquired their father.

"Yes, sir," they both answered at once.

"Huh. I only hope you didn't starve the calves or run the cows half to death getting them up to pasture. "Well," he continued, "I suppose you're in a stew to get down to the fair grounds. Get your stuff together as soon as you can and I'll take you down when I go with the milk."

It is to be feared that neither boy took enough time for breakfast after that, but what fellow would under the circumstances; none of us, I'm sure. The meal over, they rushed up stairs, back down, and out to the barn and in almost no time at all were ready to start.

"Well, you fellows certainly can hurry," commented their father. "Everything ready?"

"Yes, sir."

"Let's make sure before we get under way. I've let you two look out for everything yourselves because this is your show, but I do want you to make a good showing whether you win or not. I see you've got a can of dressing, brushes, and all that. How about feed for those pigs. Got plenty down there?"

"We took plenty of meal and some corn," answered Dick.

"I see. Got any skimmilk?"

MANY PIG CLUB MEMBERS ARE FEEDING SEVERAL PIGS THIS SUMMER

"No, sir."

"Well, I think it would be a pretty good plan to take some. Hogs like milk and you want yours to take a good feed this morning. Remember they're in a strange place and it's a good plan to furnish them with a good meal. Then a little milk just before they go into the ring won't do any harm. I'll tell you what to do. Get that old milk can in the shed and fill it half or two-thirds full. We'll take it along with us."

The boys did as they were told and soon the little truck was on its way. Once at the grounds it did not take them long to get busy. Feeding was the first order of business and using some of the skimmilk they made a slop with middlings and a little oil meal. Later they fed soaked corn.

"Now then, George, let's get busy with that water we drew last night and give these fellows a real bath," said Dick.

And those pigs did get a bath too. The boys scrubbed them thoroughly and rubbed them dry with old cloths brought along for that very purpose. Then Dick pulled out the pail of dressing and using a good brush, started in with that.

"Dick, what the deuce did you make this of," asked George as he, too, prepared to use some of it. "Looks like you used glue and fish oil."

"Huh, I used olive oil, machine oil, gasoline, coal oil, and turpentine. We gotta watch out and not let any guys light matches around here, else we'll be having roast pig," answered his brother.

"That would be a great note, wouldn't it. Well, here goes. My pig's got to have a shining too."

A half hour later Dick threw his brush into the corner of the next pen which was unoccupied. "There, that's done for a minute," said he, "I'm going to go see what the other guys are doing. Coming along?"

"No, I guess not. I'm not through with this fellow yet," returned George.

"All right," and Dick started off.

An hour and a half later he returned, to find his brother still working around the pen.

"Well, gee whiz, aren't you through yet?" demanded the younger boy.

He came up and leaned over the side of the pen scrutinizing George's pig carefully.

"Say," he continued, "there's only one out there got you beat and what do you think, that's Beans'. He's sure got some pig. You've got me skinned here all right," he admitted ruefully. "Don't know quite how you did it either. My report shows up better'n yours and my pig's just as heavy. Maybe a little heavier. Guess yours must be naturally a better show hog."

"How's Beans hog for size?" asked the older boy. "Is he bigger'n mine?"

"Yep. Quite a little bigger and say, he's as smooth as they make 'em. Beans must have thrown the feed into it all right. He said his report wasn't very good."

"Well, I won't feel sore if Beans is the only one that beats me," said George. "He's worked like the deuce and besides he's only a kid anyhow. One thing's sure, my hog shows a profit so far even if it isn't quite so good a one as yours."

"Nope. Yours is only a cent a pound more. Well, I guess I'll do a little brushing," and the boy went over to give his pig another polishing.

Both boys worked in silence except when some of the crowd drifting by to view the stock stopped to question them. For a half hour they kept busy, then Dick, restless as usual, started down the long line of buildings, but this time George went with him.

"Guess I'll take a look at the other fellows' stuff myself," said he. "I ain't been around yet."

They went from one pen to another, stopped to talk with the fellows here and there and finally with three or four of the others they went over to a quick lunch counter for an early dinner. Their pigs were to be judged early in the afternoon and not a one among them but wanted to be ready on time.

The hour set for judging the club pigs was one o'clock and at exactly two minutes after, the last one was in the judging ring. Those ten pigs had been washed and brushed until they actually shone and their owners were undoubtedly the proudest stockmen on the grounds. They had a right to be proud too, for the pigs showed plainly the results of care and good feeding.

Mr. Hatton, a hog breeder from an adjoining county was the judge, and after about twenty or thirty minutes deliberation he placed the ribbons. The blue went to Roger Dean, second place to George Barret, and third to Stub Lewis.

"Boys," said Mr. Hatton, "I want to congratulate you. You have succeeded in raising ten mighty fine pigs. You must have fed them right and taken good care of them because the pigs show it. They weren't easy to judge except this lad's," laying his hand on Roger's shoulder. "He really had a show pig. That pig, of course, has been fed right but he's built right too. Look at its back, the depth of its body, the shape of its hams and, in spite of its size, there isn't a bit of coarseness anywhere. That surely is a blue ribbon pig, one that would look well in almost any showing."

"Just a minute before you leave, boys," said Mr. Clarke. "This judging today counts 20 per cent in your contest work. The gains your pigs have made and the costs of those gains count the other 80 per cent. You have exactly three more weeks to go, so get busy. Remember that just because you weren't a winner here today is no reason why you cannot be in the end. Now, then, back to the pens with your pigs."

Three weeks later those final reports were turned in and after Mr. Clarke had corrected them, he posted a summary of the results upon the bulletin board.

Here is the summary as it appeared and it is noticeable that every pig paid some profit:

ONE OF THE MANY JUNIOR DAIRYMEN INTERESTED IN PIG CLUBS

Name	Total gain Lbs.	Gain per day Lbs.	Cost of gain Per lb.
Richard Barret	171	1.5	$.056
George Barret	153.9	1.35	.075
Mike Lewis	148.2	1.3	.071
Arthur Lewis	126.54	1.11	.069
Roy Harris	156.18	1.37	.087

Second—Milke Lewis
Third—George Barret

Junior Letters

Hoard's Dairyman Juniors:—I received my fob, creed, and button, and was glad to get them.

I have a nice Jersey heifer. She is about one year old. I bought her when she was about 5 days old. I got her cheap I think. I got her for $1.25. My brother has a pig. It's a Berkshire boar.

I am going to get me some chickens I think.

Father took a registered Jersey cow to the fair which won second prize. I took a registered Jersey bull calf which won first prize.

I am eleven years old and am in the fifth grade at school. Our school will be out in about a week or two. We have about twelve cows, half Jerseys and half Holsteins. We run a dairy. I help father deliver the milk every morning. We deliver it in a truck. When school is out my brother and I are going to deliver it.

I wish some of the juniors would write me. My address is Gastoria, N. C.

Robert Grier.

Hoard's Dairyman Juniors:—It is a long time since I have written to the juniors so I will write now.

We have most of our crops planted already. My brother came from Montana and he did most of the plowing and drilling while we did the other work.

Dad gave my two brothers and me about two acres of land which had to be cleared yet, and now we have got it planted with peas which we expect to sell and divide the money among us three.

Dad sold a veal calf today about a week old for twelve dollars.

We have four nice heifer calves which Dad expects to keep.

We get about five cans of milk from about twenty cows.

Well, I can't think of any more news so I will close. If any of the juniors wish to write to me my address is Everson, Wash.

Bert Brune.

Hoard's Dairyman Juniors:—It has been a long time since I wrote you last but I have been busy at the farm work. I am now 13 years old and I weigh 136 lbs. School stopped on the 17th and I will be in the eighth grade next year. I am milking nine cows at a milking now and we are milking 27 in all.

We just ran out of silage last Sunday and our cows are going down in their milk quite fast. You asked me about how many tons to the acre of silage corn we produced out here. The average yield around here last year was

Daisy Fly Killer

Sold by dealers, or 6 sent by express, prepaid, $1.00.

HAROLD SOMERS, 150 DeKalb Ave., Brooklyn, N.Y.

20 tons to the acre. We are having some very cold weather around here and some of the farmers say that most of their corn seed is rotting in the ground.

The sugar company has hired Japs to thin weeds and top the beets. We have contracted our beets to them while we do some improving. We haven't started to improve yet so I haven't much to do. Well, I guess this is all for this time.

Utah. Harry M. Stone.

Hoard's Dairyman Juniors:—It is a long time since I have written you. I guess you have not forgotten me. This is my sixth letter.

We have nearly all of my crops planted. It has been raining for a long time. The wind blew so hard that the large barns on the hill were nearly blown down. We have about 40 chickens and one duck. I wish to have one more duck. Our duck lays an egg every morning. We sold one cow; four are milking now. One will be fresh soon. We have our Holstein bull calf yet. He is 1½ years old. His name is Chatham Fobes Ladoga. We bought him from Chatham. He was six months old and cost $50.

I did some trapping last winter and got 8 weasels. I got the bounty of five. I wish the juniors who have sheep would write to me their prices. My address is Box 28, Gwinn, Mich. Weikko Lukkauinen.

Hoard's Dairyman Juniors:—This is my first letter to the juniors although I have been a member since it started. I thank you for the fob, button, and creed. I have the latter framed and wear the other two. I read the juniors' page every week and enjoy it very much.

We live on a 40-acre farm and raise Jersey cattle. We have nine cows and they all are milking now. Our best testing cow is half Guernsey and half Jersey. She tests 6.3% and our other cows test 5 and 4 per cent except one.

We had a registered Jersey bull, but we sold him because we couldn't use him any longer. His name was Domino Golden Ladd.

I have one cow of my own. She has a nice hiefer calf and her name is Kora and the calf's name is Mayflower.

We have not gotten our corn for silage planted yet as it has been raining for over a week. We have had some electric storms here this spring.

We send our cream to the largest creamery in the world.

We have a large orchard of plums, apples, and cherries. We also have 400 strawberry plants. All the clover around here froze out last winter so I am afraid we will run pretty short of hay this year as papa also had a good sized patch of clover. But we seeded some oats that we are going to cut green for hay. It makes excellent hay when taken good care of. We had some last year and the cows like it fine.

I am sixteen years old and am 5 feet, 6½ inches tall and weight 132 lbs. My mother and brother died when I was 4 years old, so papa and I live alone.

Well, as my letter is getting lengthy I will conclude.

Wishing good luck and success to the junior department.

Wisconsin. C. O. Forseth.

Hoard's Dairyman Juniors:—I am sorry I haven't written. I have been helping my father get ready for spring crops.

You asked me what I was going to do this summer. I am going to raise things in the garden to sell. I will keep an account of how much I make.

We are going to water our beets, tomatoes, cabbage and other things. We will have seventy acres of spring crops. Papa says we won't have much wheat this year.

We have two hounds, one gray hound and one wolf hound.

The mare we worked to school has got a little colt. Papa said that if we made a good crop this fall he would give us a two-year-old horse.

I have a brother in a camp in California. We have two pictures of him; one is a picture of him and the boys that live in the same camp. The other one is the whole regiment.

The other night we let some hens out. After a while we went to look at them to see if they were all right. When we got to the hen house we saw three rabbits in the garden. Papa got the shot gun and shot one twice. Then the hound that had the broken leg run out there and chased it around a few times. The wolf hound was about a quarter of a mile behind, but he caught up with him and run ahead of the other and caught it.

I would like to hear from some of the juniors. My address is Mills, R. F. D. A, Box 20, New Mexico. Ralph Lemon.

Hoard's Dairyman Juniors:—As I am a young junior I will try and write and tell you where I live. I received the fob and button and like them very much. I live on a farm in Mercer County, Pennsylvania. My father owns a farm of 115 cares. We have 16 head of registered Jersey cattle. We think they are pretty good. Papa says they are Eminent and Noble of Oakland blood.

We send our cream to a creamery. I am 10 years old. I help papa with the barn work, feeding the calves and the pigs and water the horses. My brother, who is 8 years old, and I bought a calf for $2.50. It is worth $15 now.

We think Hoard's Dairyman is the best paper printed. I read the juniors' page every week. We sold a cow and a pig. We sold the cow for $120 and the pig for $50.

As my letter is getting rather long I will close for this time. Wishing all the juniors good luck.

Pennsylvania. Harold W. Cox.

Hoard's Dairyman Juniors:—I received my fob, button, and creed and thank you very much for them. As this is my first letter I don't know what to write. I am ten years old and in the sixth grade. I live on a farm. I have a filly that can single foot and pace. My brother and I have some Ancona chickens. My father has six cows, three calves, and three horses. I take the cows to the pasture every morning and go after them every evening.

Illinois. Arthur Farthing.

Hoard's Dairyman Juniors:—I have not written for a long time so I thought I would write. This is my third letter to the juniors.

We have eighteen head of cattle, all Jerseys, and ten milk cows. We are only milking eight now; two of them are dry. I milk four of them nights and mornings.

I am eleven years old and am in the fifth grade at school. I have one brother older than I am. I have six sisters.

I live on an eighty-acre farm a mile and a half from town. We go to town to school.

Wishing good luck to all.

South Dakota. Kent Baird.

Hoard's Dairyman Juniors:—It has been a long time since I wrote to you.

I live on a farm of 110 acres. We have 27 cows and are miking 12. We have one pure-bred Holstein bull and 6 head of horses; 2 of them are colts. We have 2 silos and fed all the silage two weeks ago.

We have 40 head of hogs to feed skimmilk to. I have one pig. I lost a fine sow a week ago. I have one heifer papa gave me for helping to tend to the cows. I sold a calf about a month ago that brought me $52.50.

Wishing the juniors good luck.

Tennessee. Fongie Baker.

Hoard's Dairyman Juniors:—My father takes Hoard's Dairyman. I sure like to read the juniors' letters.

Well, I will tell you of our farm and stock. We have six thoroughbred Shorthorns; six of them heifers and one registered sire. Then we have forty-two other cows. We milk one Jersey cow but will be milking about fifteen pretty soon. I have one heifer and one pony whose name is Prince, one dog, and one registered Hampshire pig. We have a colt and his name is John.

We have dipping vats down here. I think they are fine. The cows are not worried with ticks.

I have one brother and two sisters. My brother is deaf and is at school for the deaf at Cave Spring, Ga.

How many of the juniors like to live on a farm? I do.

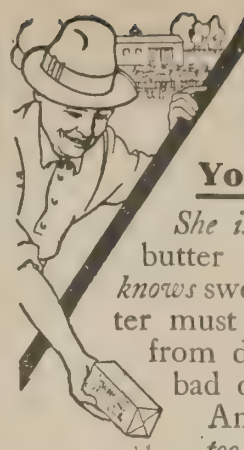
We have between three and four hundred hogs every year.

How many of the juniors have my birthday? —September 27. I am twelve years of age and I am ready for the eighth grade.

I would be glad if some of the juniors would write to me. My address is Thomasville, R. F. D. No. 6, Georgia.

Talmage, Elrod.

Hoard's Dairyman Juniors:—I guess you will think I have forgotten you but I have not. I read all the letters and keep posted but I have been so busy, as my oldest brother is in France and that leaves me, 12 years old, to take his place in the field. I've plowed all our corn land and harrowed some and papa is planting corn. We milk 10 cows. Just shipped 10 fat yearlings to Sioux City. I have joined the pig club and I hope to be successful. I have one duck setting. I have rabbits also. I sold 4 pairs and donated 2 pairs to a Red Cross Auction Sale.



South Dakota. Charley Walraven.

Hoard's Dairyman Juniors:—It has been a good while since I wrote but I will try to write a few lines. My heifer was fresh in January. I sold her calf when he was six weeks old for $18.90. We did not have a scale when she was fresh and so I am not going to weigh her milk till she freshens again. We are keeping the records of three of our cows. I milk one of them and weigh her milk. We are milking 12 cows. I milk four of them. When we bought our scale we bought a tester, too. We are going to test our cows and the ones that don't pay we will sell. We have not turned our cows on grass yet for we have a good deal of silage. Our cows are mostly Shorthorns and Jerseys. We have one full blood Jersey and one Holstein. We have 43 pigs with 6 sows. Some of them are Duroc-Jerseys and some Poland-Chinas. We have three heifer calves. We ship our cream to Blue Valley Creamery Co.

Missouri. Virgil Rusk.

Hoard's Dairyman Juniors:—I have not written for some time, but have been going to school. We have two pigs and I feed them. We boil potatoes and mash them, put two quarts of hominy feed in with the potatoes. My heifer is doing fine. I feed her one quart of mixed feed night and morning. I must close now wishing all the juniors good luck.

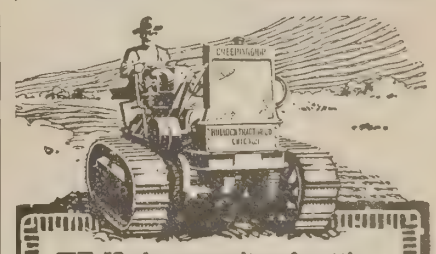
Massachusetts. Frank Joslin.

Does Mrs. Housewife Demand Your Butter?

She is the judge of butter value. *She knows* sweet, clean butter must be protected from dirt, dust and bad odors.

And *she is only too glad* to pay extra for good butter wrapped or covered with

Paterson Pioneer Parchment Paper



It is *worth* more. Your brand stamped on it stands for *quality*. She learns to demand it by name. *You profit.*

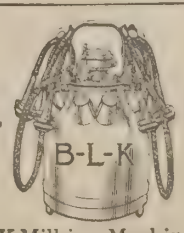
Made in rolls, sheets and circles, to suit all methods of marketing.

Write for free samples and book "Better Butter". It points the way to better butter prices and bigger business.

THE PATERSON PARCHMENT PAPER COMPANY
37 Eighth St
Passaic, N. J.

IT IS the necessity of cutting labor costs and releasing men for the front that makes the tractor a present necessity.

CREEPING-GRIP



is an old acquaintance of war-time conditions. As son of a worthy sire, the British Battle Tank, it knows the grudging warrant of rough ground; but lumbers on—majestic, resolute.

The BULLOCK CREEPING GRIP TRACTOR promises to do more and better work than three men and six horses on any farm. We only ask that you encourage it to make this promise good.

A three-bottom tractor—25 h. p. on drawbar. Write for catalog today.

BULLOCK TRACTOR COMPANY
1809 Diversey Parkway, Chicago, U.S.A.

About ten hours work per day, no farm work, wages seventy-five dollars per month, board and room, with a bonus of five dollars per month for a year's service. No railroad fare advanced. W. H. BORCHERS, West Sacramento, Calif. 1-2

Wanted—A working manager, and wife as housekeeper, on dairy farm near Detroit. Man must be good stock man and general farmer and wife a capable housekeeper. No small children. Cash salary and all household expenses, or will lease to suitable man; farm fully stocked and equipped. 300 acres. H. S. KISKADDEN, 1355 David Whitney Bldg., Detroit, Mich.

Man and Wife—For dairy work. Man to do some farming. Wife to assist with milking, wash milk utensils. Hinman Milker, 30 Holsteins, separate with gasoline engine. Wages $80 per month, house, wood, milk, cream, potatoes. Best conditions and excellent opportunity to right couple. JAMES M. EATON, Belle Fourche, S. D.

Wanted—By August 1, single man for small Guernsey herd in northern Ohio. Must be neat, temperate, reliable, a good milker, buttermaker, and calf raiser. Good home and good wages. Address BOX 137, care Hoard's Dairyman.

HELP WANTED

Wanted at Once—Single or married man, with only one child, to help on farm. A steady man, good milker. Please state wages wanted in first letter. WILLS BROS., Crystal Falls, Mich.

Farm Help Wanted—Teamsters and farm hands. Good opportunity for well disposed capable men. Wages for single men $45 to $50 per month with excellent accommodations. Married men $60 to $70 with cottage. Applying in person ready for duty preferred. ANNA DEAN FARM, Barberton, Ohio. 1-tf

Wanted—For fine country estate where the best of accommodations and wages are provided for, one orchard man, one gardener, two teamsters, two milkers and two laborers. Only reliable, experienced men need apply. Send your application to "THE ELMS," 710 Chamber of Commerce, Buffalo, N. Y. 1-3

Milkers Wanted—For the great Anna Dean herd of Guernseys. Good opportunity for well disposed capable men. Wages for single men $45 to $50 per month with excellent accommodations. Married men $60 to $70 with cottage. Applicants applying in person ready for duty preferred. ANNA DEAN FARM, Barberton, Ohio. 1-tf

Working Foreman and one farm hand on dairy farm, good living quarters and food, also good wages. Give reference, age and wages in first letter. S. E. FLORSHEIM, Minocqua, Wis.

Shepherd wanted on Brandywine Meadow Farm, West Chester, Pa. Apply to JOHN McBRIDE, Manager, Route D, West Chester, Pa. 1-2

On large dairy farm, state of Maryland, wanted man and wife, no small children, to take care of boarding house. State wages wanted and qualifications in first letter. Address BOX 136, care Hoard's Dairyman.

Wanted—September 1, herdsman with experience, to care for large registered Guernsey herd, cows in A. R. test. Good habits and not in draft. $60 and board, chance for advancement. Give age and reference first letter. HOMER F. RUNDELL, Livingston, Wis. 1-5

Wanted—Married man to work on Holstein farm. Good house, milk and garden furnished. Give experience and wages desired. J. E. RUNDELL, Roberts, Wis. 1-2

Wanted—Young man for retail milk route and general dairy farm work. WOODLAND DAIRY FARM, Tomahawk, Wis.

Wanted—Married and single men to work on farm. Good opportunity to right persons. Fourteen cows to milk. No boozer nor socialist need apply. Reference required. For further information write ALLEN T. BOUTIN, Bloomer, Wis.

Wanted—Man to milk and do dairy work in small dairy. No booze fighter. $50 and board. A. B. SPOONER, JR., San Luis Obispo, Calif.

Wanted—An experienced herdsman for a modern 50-cow dairy plant. Must understand milking by machinery, also the care of ice and bottling machinery. Must understand feeding and breeding of cattle. A-1 living quarters and an unusual opportunity for the right man. Give age, salary expected and references in first letter. M. S. PLAUT, Danville, Ill.

Wanted at Once—A first class all around man to take charge of certified farm, fifty pure-bred Holsteins. ARDEN FARMS, 404 Hackney Building, St. Paul, Minn. 1-2

Wanted—Married man to take entire charge of small herd Holsteins. Must be experienced milker and calf raiser. Permanent position. Give references. C. W. HENRY, Greeley, Colo. 1-2

POSITIONS WANTED

Farm Manager—American-Bohemian, married, wants position September or January 15th. Experienced in raising and handling stock and dairy cows, managing help for best results on any size farm. Guarantee success. In Central States. F. HENRY, care W. M. Young, R. 3, Eagle Grove, Iowa. 25-4

Wanted—Position as herdsman or farm superintendent by a college graduate, 31 years of age, married, no children. Life long experience on large farms with pure-bred and grade Holsteins. A. R. O. work a specialty. Only a large and liberal proposition with best of living conditions will be considered. Wife cannot care for help. BOX 122, care Hoard's Dairyman. 25-tf

Position Wanted—Single man, steady, above draft. Stock or dairy farm. First class dry hand milker. BOX 134, care Hoard's Dairyman.

Open for proposition in management of cattle and farm, or herdsman, no certified herd considered. Leaving present place August 1, 1918. SUPT. ARCADY FARMS, Lake Forest, Ill.

Wanted—Position by dairyman and farmer. Experienced, references, married, 1 child. Wife good housekeeper. KUSEL, 36 Newell St., Pittsfield, Mass.

Wanted—Position in bottling room of a certified or sanitary dairy; 6 years' experience; good references; state wages. BOX 133, care Hoard's Dairyman.

Position wanted as dairyman or manager. Fully experienced in balanced rations, testing, calf raising, A-1 buttermaker, milking machine, tractor and gas engine operator. Good hog raiser and thoroughly experienced in farm crops. A hustler and wife a neat housekeeper. Temperate and no cigarette fiend. References furnished and good reasons for change. Address BOX 132, care Hoard's Dairyman. 1-2

Farm and dairy manager, thoroughly qualified in every respect. Practical and scientific. Now available. Address BARRON, 904 Wilson Ave., Chicago, Ill. 1-2

Hungarian man, small family, wishes position as farm manager, practical farmer, understand dairying, best references. RASKY, 210 E. 70th St., New York City.

Situation Wanted—As manager of some real modern up-to-date estate, either large private estate or up-to-date commercial dairy farm. Thoroughly understand the production of really high grade milk and cream and the retailing of same; understand lawns, shrubs, garden, poultry, etc. Age 36. Married, no children, protestant and of good habits. If you should be interested in such a man write and a personal interview can be arranged. Address BOX 131, care Hoard's Dairyman.

Situation Wanted—Washington, Oregon, California by up-to-date dairy farmer, experienced pure-bred stock, A. R. O. work, sales and show ring, farm and garden crops, silos, etc. Married, 2 children, references. Address BOX 241, Santa Ana, Calif.

Farm Manager—American, age 42, is open for engagement. Only first class place considered. Life experience. Past 18 years as manager. Thoroughly experienced in all branches of farm and dairy. Exceptional recommendations. BOX 138, care Hoard's Dairyman.

Wanted—Position as farm manager by October 1. Married, 26 years old, life experience dairy farming, no booze or cigarettes. J. M. CANNON, Waukegan, Ill.

Experienced working farm foreman, 33 years, married, no children, open for position Nov. 1st. Best references. State wages. ALFRED DEAL, Kilbourn, Wis.

Position wanted as assistant buttermaker in creamery. Experience with boilers, pasteurizer, testing. Single, over draft age. E. D., P. O. Box 75, South Chicago, Ill.

Undesirable Flavors in Dairy Butter

Bulletin 71 published by the British Columbia Department of Agriculture on the subject of farm buttermaking names undesirable flavors as one of the most common defects in dairy butter. According to the publication any or many of the following causes may be responsible for such flavors:

"(1) Milking in unclean stables.

"(2) Cow's udder and teats in an unclean condition at milking time.

"(3) Foods that impart volatile flavors, such as turnips, onions, cabbage, spoiled and fermented feeds, etc.

"(4) Separating the milk in an unsuitable place where there is a lack of pure air and ventilation.

"(5) Improperly cleaned separators and milking utensils.

"(6) Keeping the cream or butterfat at too warm temperature and in poorly constructed, ill-ventilated storage.

"(7) Cream too old or too ripe before churning and too much buttermilk retained in the butter.

"(8) Impure water, cows drinking from stagnant ponds or the seepage from barn yards.

"(9) Result of the growth of injurious bacteria, yeasts, and molds."

A study of these nine causes reveals the fact that practically all of them are under the control of the farmer or dairyman and hence he is largely responsible for the ill-flavored product. There is no excuse for having the stable continually dirty or the teats and udders badly soiled, nor is there any satisfactory reason for using a dirty separator or dirty milking utensils. Hot water is not particularly expensive and a liberal use of it will do for the milking utensils what a little extra effort and sunshine will do for the stable. Cleanliness does not mean an outlay of expensive equipment and is the thing above all others that a dairy farmer cannot afford to be without.

Very often flavors noticeable in cream or butter and ascribed to such feeds as turnips or silage may have been absorbed by the milk after it was drawn if those feeds had been fed just previous to or at milking time. Such feeds should be given after milking rather than before. Of course, such feeds as onions or spoiled feed have no place in the ration of a milk cow.

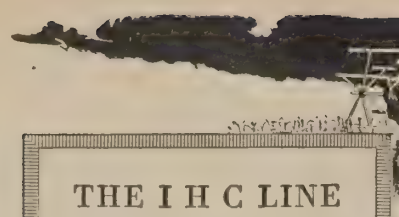
The question of the proper place for the separator is easily settled if there is a milk house available. Such a milk house need be merely a simple clean room with a solid floor and screened doors and windows. Equipped with a tank which can be kept filled with cold water it affords an excellent place for keeping cream or butter at a proper temperature as well as for the separator.

Usually the most satisfactory method of ripening cream is to keep it as sweet as possible until about 24 hours previous to churning and then slowly bring the temperature up to 65 or 70 degrees Fahrenheit. When it has ripened sufficiently to produce an acid smell, a slight acid taste, and shows signs of thickening, it should be at once thoroughly and quickly cooled to churning temperature. It is best to time the ripening so that the cream may be cooled for churning 8 to 10 hours before it is to be churned. This is necessary to avoid a soft, weak-textured butter. Properly ripened cream should have a sharp, pleasant, acid taste and smell, and when poured should be free from lumps and have a smooth, glossy appearance.

Clean utensils and proper care in handling the cream, including holding at the proper temperature, will do much to prevent disagreeable flavors due to the growth of bacteria and molds.

Order Your Fertilizer Now

The United States Department of Agriculture is urging farmers to make known their fertilizer needs for the fall planting at the earliest possible date. It points out that this will enable dealers to combine their orders into full capacity carload lots.



This step is made necessary by the difficulties in handling freight at this time. The railway systems of the country are taxed to the utmost to move the tremendous volume of supplies for our troops. Many farmers who ordered their spring fertilizers late did not receive them until after planting time. Some failed to get them at all. Prompt action will tend to avoid disappointment this fall and enable every farmer to start his crop right.

The intelligent use of fertilizers is one way by which the farmer can increase crop production and at the same time make the labor expended produce more than formerly. There was never a time when the use of fertilizers was so profitable as now with crop prices high and labor scarce.

The railroads of this country are now being operated by the United States government. Co-operate with your government by ordering your fertilizer early. It will relieve the car shortage. C. A. S.

Butter for the Navy

Butter for the navy is being inspected by dairy manufacturing specialists of the Department of Agriculture to insure a uniformly high quality for men in the service. In this work, greatly enlarged since the war, there are 60 specialists inspecting the output of 90 creameries in various parts of the country. Only the best grade of cream is accepted for making this butter. More than six and a half million pounds of butter will be inspected during the season, and most of it will be packed in lacquered tin containers in order to preserve its quality for as long a time as possible.—Weekly News Letter.

THE American farmer produces more per man than any other farmer in the world. Using labor-saving machines, he produces record crops with less hired help than is required under any other system. Therefore, in the present crisis, with help so scarce, every farmer should use the most efficient farm machines he can get, the only kind that can be depended upon to make the necessary increase in production.

The International Harvester Company of America markets the full line of high-grade machines listed in this advertisement for disking and harrowing seed beds; planting and cultivating crops of all kinds; cutting, making and storing hay; cutting, binding and threshing small grains; harvesting, husking and shelling corn; shredding corn fodder, filling silos, fertilizing fields; skimming cream; and grinding feed. It sells efficient farm power machines, engines and tractors operating on the cheapest fuels a farmer can buy. It provides wagons and motor trucks for all kinds of farm hauling.

Many of these machines have been used by American farmers for close to seventy-five years. They have helped to establish the standing of the American farmer. They are better today, more efficient and more economical than ever before. In many cases, one or another of these machines will solve the hired help and farm power problems on individual farms.

International machines are sold through ninety branch houses and over thirty thousand local dealers. Any customer can place an order, or command the services of this organization, by a telephone call to the dealer, or a visit to the nearest town.

It is important this year that all orders for machines be placed as early as possible, preferably months in advance. See the local dealer, or write us about the machines you are going to need this year, and do it now.

The New York Co-operative Law

At the recent session of the Legislature of New York there was passed the Wicks Lord Co-operative bill, which has become a law by the approval of Governor Whitman. Its purpose is to allow the formation of associations of farmers for the purpose of acting as agents for their members, such associations to have no capital and not to be conducted for profit.

The law follows the suggestion of the U. S. Department of Agriculture for the formation of such co-operative organizations and is based on the act under which the California fruit growers have formed their very successful association, being so modified as to make it applicable to New York conditions. A membership corporation such as this new law provides for could not be formed under the existing co-operative law of the state, as the latter provides for the issuance of stock and the distribution of earnings. The law has the approval of the Council of Farms and Markets, and it is hoped that through its general adoption by farmers the expense of marketing farm products will be reduced, to the benefit of both producer and consumer.

Five or more persons may incorporate "as a membership corporation for mutual help, not having capital stock or conducted for profit, for the purpose of acting as the agent for its members or any of them, performing for them services connected with the production, manufacture, preservation, drying, canning, storing, handling, utilization, marketing or sale of agricultural, dairy, or horticultural products produced by them, and for the agriclutural, dairy, or horticultural purposes of such members, or for performing for them services connected with the purchase or hiring for or use by them of supplies, including live stock, machinery, and equipment, and the hiring of labor, or any one or more of the kinds of service specified in this section."

Members must be engaged in agriculture, dairying, or horticulture, and should they cease to be so engaged their membership is forfeited. Each member is entitled to one vote and no vote by proxy is permitted but members may vote by mail on specific questions that are properly submitted to them. The by-laws may require that members sell all or any part of their specifically enumerated products exclusively through the association, but provision must be made for release from membership upon proper and sufficient notice. For breach of this by-law adequate and reasonable penalties shall be imposed.

The officers of the association are to be selected by the board of directors. The president and vice-president must be chosen from the directors, but the secretary and the treasurer may be non-members. A working fund may be provided by fees, dues, assessments, or charges for services, to be fixed and collected in such manner as may be prescribed in the by-laws.

The general scope of the law is indicated by the following headings of its various sections: Definition, Purpose for which Associations may be Formed, Certificate of Incorporation, Amendment of Certificate, Application of Corporate Law, First Meeting and Adoption of By-laws, Admission of Members and Forfeiture of Membership, Certificate of Membership, Voting by Members, Responsibility of Members, Association Acting as Agent for Non-membre, Contracts and Agreements, Members may be Required to Sell or Buy through the Association, Directors, Removal of Directors or Officers, Officers, Working Fund, Power to Borrow Money, Auditing Committee, Voluntary Dissolution, and Corporate Name.

A New York country paper comments on this law as follows:

"The bill fills a long felt need for farmers' organizations and particularly does it protect the interests of the Dairymen's League, which wishes to organize an association to act for its members. The council of farms and markets together with the Dairymen's League and like organizations asked the governor to sign the bill, which was originally worked out by Mr. Lord from the federal and California acts in conference with R. D. Cooper, president, and Mr. Miller, the attorney for the Dairymen's League, together with Senator Wicks of Oneida county.

"The acute situation of farmers of the state of New York has been due mainly to problems of marketing rather than production. The farmers have been willing to produce as far as their resources and ability have permitted. The remedy applicable is a method of collective marketing and sales on the part of the farmer. The individual has been practically helpless. It must be done by association and organization. This is now possible under the Wicks-Lord act."

How a Creamery is Building Up Herds

HOARD'S DAIRYMAN:—Usually a creamery is not built unless there are a certain number of cattle in the vicinity to supply a required amount of milk. In the South, where there are comparatively few milk cows, if the rule were followed there would be no creameries. But the general practice is not followed and some creameries have been built in faith, and this faith has been rewarded when coupled with initiative and hard work.

When the boll weevil invaded the cotton fields of the South, farmers had to turn their hand to something else. The dairy herd was stressed. Here and there the idea stuck. At first the milk routes were established. These introduced the farmer to the possibilities. When the milk routes proved successful by growing in output, the opportunity for the creamery appeared, or at least approached. Taking time by the forelock, progressive people have established some creameries, believing that while there might not be enough milk available at once to get such a plant to steady maximum operation, that the time was coming, and that the creamery could help it come.

The dairy experts of Washington and the extension forces of the agricultural colleges of the South have encouraged every movement in favor of establishing creameries where there is a possible chance of success. And when, under their advice, a creamery is established, and needs help, these forces are on the job and make it go. Perhaps nothing is of greater importance in establishing the future success of these creameries than the introduction of pure-bred animals with good productions to their credit. In fact, these animal husbandmen of the colleges are looked to very largely to buy these animals for the farmer.

A notable instance of how a southern creamery is made to go is afforded by the Selma, Alabama, creamery. A few days ago, J. P. Quinerly, animal husbandman of the Alabama Extension Service, and William Hardie, for the creamery, returned from Ohio with six car loads of registered Jersey cattle that had been bought for farmers within a radius of 20 miles of Selma, Alabama. This is a third trip on a similar mission. The first trip only grade cattle were bought; on the second trip, only registered cattle. Now the farmers will have nothing but registered stock.

These dairy cattle were sold at cost to farmers who were patrons of the creamery. Any one owning a cow and selling cream to the creamery could buy as many more cattle as he already had on hand, giving 36 notes to a local bank, a note coming due every two weeks at 6 per cent. The payment of these notes is taken from the creamery checks.

The cost of the recent six carloads of cattle varied from $125 to $225, averaging about $150. In the six cars there were 13 bulls, about 30 heifer calves, and 89 mature cows. All of these came from the Winona Cow Testing Association.

Selma's example may well serve other southern creamery enterprises, or suggest how a creamery may be established and successfully supported in many southern communities.

Georgia. C. A. WHITTLE.

A lie has wings and can fly far but has no feet and cannot stand.—A Chinese Proverb.

The principal dairy states will waste, this winter, 3½ Billion Pounds of Milk

Simply by failing to get it; failing, too, when it would be easy to produce that increase for a world market that demands every possible ounce of food.

Surely this is not the time to overlook any opportunity for increased dairy production and profit. It is no time for waste or neglect. The bending of every effort toward bigger dairy results, for both patriotic and personal reasons, is the duty of every dairy farmer. Here is one way in which the dairy farmers of the principal dairy states could add this winter 3,600,000,000 more pounds of milk. At $3 per cwt. this would mean $108,000,000 more profit.

These are not wild figures. They represent bed-rock facts, and they mean that if all the cows in the principal dairy states were properly watered with James Drinking Cups they would add 3½ billion *more* pounds of milk to this winter's yield—milk that would be worth to the nation as a whole, and to you in part as a producer, at only $3 per hundred, more than a hundred million dollars.

A tidy sum for the dairymen of this country to think about, isn't it? A sum well worth saving in *any* year, but especially so in this period of advancing food prices, increased milk demand and costly feed.

Then there's your own question of labor, and the protection of your herd from disease, to be thought about in this great crisis. James Drinking Cups give each cow clean, safe water that no other cow has had her nose in. They do away with the hard, cold job of herding the cows out to the tank, herding them in again—chopping open the frozen tank.

There are two shortages for you to think about: The world-wide food shortage, and your own pocketbook shortage caused by your cows not getting all the water they want, *when they want it*, at the right temperature, day or night.

They will give more. All they need is the opportunity. James Drinking Cups spell that opportunity. The milk increase of the average cow will *pay for her cup* in 90 days. At the end of that time the account covering the complete installation will be *squared* as a result of increased profit, leaving you the cups for many years of money-making service, either in your present barn or when re-installed in a new one.

Do *your* part toward getting the extra millions which American dairy interests can produce by making milk out of water. Get *your* share of those dollars. It's easy to buy, easy to install and easy to operate James Drinking Cups. We've solved this great watering problem, and solved it *right*—just as we have so many other questions relating to sanitary barn equipment. Write today for booklet, "How to Make More Milk."

A Dairy Day Dream

(Continued from first page.)

here were some of the fruits of the years of effort. And I stood there looking at the neat, trim-built, delicately colored heifers, as they responded in the best way they could to the caresses of their young master, and wondered if there could be any higher degree of satisfaction in working out a big ideal than we were now enjoying.

Some men have day dreams of another kind. Their visions carry them out into the realms of public life at times. Again it is wealth, great political preferment, power over men, ability to lead in business, financial, or warlike operations. I suppose all these dreams have that about them which satisfies to some extent; and yet, of all the men I ever knew who devoted themselves to such occupations, few but have confessed when coming down to the end that they would have been happier if they had lived nearer to the hearts of men and the creatures of the great open, beautiful country. Money and power and earthly success in and of themselves have little in them to satisfy the best longings of these natures of ours.

But if there is any greater happiness than in taking a little creature, such as one of these heifers was when its wobbly legs first lifted it up by the side of its mother, and watching it grow, and doing all things possible to help it develop the best there is in it, I do not know what it is. Blessed is the man to whom such a day dream comes! He is helping to make the world better and happier!

New York. E. L. VINCENT.

Food Administrators Endorse Motor Transport

The movement to utilize motor trucks on Rural Express Lines has received the endorsement of a number of state food administrators. The Highways Transport Committee of the Council of National Defense has received a very general and prompt response to its suggestion that motor trucks be utilized to facilitate the movement of perishable food products to shipping and consuming centers. This will relieve farmers of some of the task of hauling so that they may devote more time to actual crop production in the field during the period of labor shortage.

Arrangements are being perfected in a number of important fruit growing sections to supplement the usual shipments of fruit by rail by using fleets of motor trucks during the rush period of fruit harvest. Surveys conducted by the Highways Transport Committee show that trucks can be made available for this work and all that is required is that steps be taken to mobolize them promptly when needed. It has also been found that a large number of trucks owned by farmers are now used only a few days a week, and in many instances arrangements can be made to have these trucks used to haul perishables in an emergency.

The establishment of permanent lines of Rural Motor Express is being brought about by making local surveys of communities in which there is need of regular daily service for farmers to and from the market and shipping centers. In several states the federal food administrators are assisting in this work by discovering localities where such highway transport is needed.—U. S. Food Administration.

With a population of 40,000,000, France is mothering more than 2,000,000 refugees.

Is Peat a Stock Feed?

(Continued from page 6)

and some of it at times is digestible. The digestion of fiber, however, is a net loss rather than a gain to the animal as more energy is required to digest and assimilate fiber than the fiber itself contains. The excessive amount of fiber present in comparison with the other constituents neutralizes any nutritive value these might have, as the digestion of the fiber uses up more energy than could be provided by the small amount of nutrients that might be present. The fact that some digestible constituents may be present is no real indication that it has a nutritive value because the efforts expended by the animal in obtaining these nutrients cause the use of more energy than the nutrients provide.

Some manufacturers of feed containing peat quote Pfeiffer as stating that an appreciable quantity of peat was digested. Pfeiffer did make this statement in 1904 but in the following year he reversed his decision. Voelcker stated that the peat used in molasses feeds is useful, mainly on account of its powers of taking up the molasses and holding it in convenient form rather than because of any intrinsic feeding value it possesses and that the nitrogenous substances not being true protein can be of little feeding value, and similarly the oil present is of little value.

The authors quoted so far do not show peat to have any feeding value and others go even farther. Salecker and Statzer and Gay all state that the feeding of peat lowers the digestibility of the substances fed with it. This is very probably due to its fiber content.

On the whole it may be said that peat in itself has no feeding value and may even depress the digestibility of the substances with which it is fed. It is, however, a very convenient substance to mix with molasses as it puts it in a form convenient to handle. Its use for this purpose is legitimate, provided the resultant mixture is sold for what it is without claims being made regarding the nutritive value of the contained peat.

Bigger Fertilizer Bags Help Uncle Sam's Soldiers

Twenty-one million yards of burlap valued at $4,000,000 could be saved annually if all fertilizers were shipped in 200-pound bags. Burlap is now growing scarce because of its increased use in trench warfare and food shipments and because of reduced importations. Pointing out that the burlap situation is steadily getting worse, the United States Department of Agriculture suggests that fertilizers be shipped in 200-lb. bags.

Not only are burlap bags scarce, but the jute from which they are made is imported from India, and the shortage of ships has materially interferred with the supply. The necessity of furnishing the army with bags for trench use will further deplete the available supply. A severe shortage of burlap would seriously handicap the movement of fertilizers to the farm, since the need for food containers would receive first consideration. It is, therefore, considered necessary that the use of burlap for carrying fertilizers should be cut to the greatest possible extent. Knowing these facts, every patriotic farmer will gladly co-operate by handling the larger bags.

Another way in which farmers can help save burlap is by marketing any second hand bags they may have on hand. Dealers are offering from 6 to 15 cents each for these second hand bags, depending upon size and condition. Why not sell any spare burlap bags now while the need is so great?

C. A. S.

Canned Milk vs. Can Milk

(Continued from page 5)

the shelves of the corner grocery—and her bothersome milk problem is efficiently solved. "Once used, always used," cries Mrs. Housewife with a sigh of relief. Many million women have found this to be true and the family cow is purchased by the dozen or box—and the milk bottle disappears from a shocking number of back stoops all over America. It's surprising but true.

The sale of fresh can milk in New York City to the poor has largely fallen off of late years, partly owing to the good offices of the Bordens and kindred souls who have had their own reasons for educating both a rich, poor, and in-between public to buy the tin cow. In every hamlet, town, and metropolis in the states today, the demand for this kind of milk is actually jumping. In direct proportion to the increased demand for the tinned article, the demand for fresh milk in its old form has fallen off and will continue to do so if nature takes her course, ably assisted by "canned" propaganda. I believe that the dairymen of New York State especially have a great rival to fear from evaporated and condensed milks. These have patiently but none the less insidiously worked their way into general use until they are threatening the whole foundation of city shipper milk. The housewife finds this milk easy to buy—easy to use. She pays from twelve to fifteen cents for a pint can of evaporated milk and then dilutes it until it is doubled in quantity. If she desires whipped cream on short notice, she has only to milk the tin cow just as it comes from the can and, after beating, she has cream for the price of regular milk. She can see only cheapness and good in buying her milk from an uncontaminated source and while milk wars wage around her, she serenely is immune from all annoyance. The children of the vast army of canned milk users are sometimes provided with the fresh article, but they are more likely to "dislike milk" as their mothers put it. This, then, we have to consider. Do we wish to see the fresh milk market gradually undermined by its canned rivals? If canned milk is the true preference of America, should we not adjust ourselves to the coming order of things and be ready?

One might make a bad pun over the present situation and call the milk mess we find ourselves in the "milk of human blindness!" But at any rate, it would seem safer and saner to stop, look, and listen before buying up the great shipping stations which proved so profitable once for those on the inside, but which may contain a nigger in the woodpile today. We have spilled enough milk for the present, whether unintentionally or not, and the time for crying about it is gone. The tin cow in American homes will bear investigation. A solution of our troubles may appear at the inquest of can and bottled milk.

HELEN S. K. WILLCOX.

New York.

Advice to Cattle Breeders

The following advice was given by Professor H. H. Wing of Cornell University, New York, to a group of Maine farmers at a meeting last summer. He speaks from a long and successful experience in dairying and from wide observation of practical live stock management:

"I think the history of improved live stock in the United States has shown a rather unfortunate thing. Apparently there have been too many instances where the breeder of pure-bred cattle considered himself rather above the rest of his community. The man who first brings pure-bred cattle into a community naturally is an enterprising man, a man who is capable, who has the skill and the disposition to breed these cattle. He is undoubtedly a leading man and in too many instances that man has apparently wanted to maintain this position, and he has thought that the way to do it was to prevent his neighbors from doing the same thing. He liked that solitary position. 'I am the one man who has Holsteins in this township.' Now if we are going to disseminate pure-bred cattle, if we are going to make Holstein cattle or Jersey cattle or Guernsey cattle an element in the improvement of the live stock of our country, it means that not only you but every one of your townsmen should be engaged in the business, and you are doing the best missionary work, not when you sell a bull for $1,000 to go over into New Hampshire or down into Massachusetts, but when you sell ten bulls for $100 apiece right around in your own neighborhood, to grow up there a class of animals that will make not you alone but your neighbor and your state noteworthy for doing that sort of thing. And it seems to me that with the advanced registration and with your local organizations, it is possible for any community to make itself felt as a center, I care not for what breed.

"Then, too, there is another thing that works against the dissemination of pure-bred cattle. We can see the history of it all through the country. Come back to this enterprising man who goes off to a show or somewhere else and gets some pure-bred animals and starts his families. He has fair animals and he has good ones. They are coming along first rate and he is doing all right. They are a credit to him, a credit to his enterprise, a credit all the way around. His neighbor sees what this man has done, and so he goes off and nine times out of ten what does he do? He says, 'That man has Holsteins; I want something different. I will get Guernseys or Jerseys or Ayrshires'. A man in our section had that idea, and he bought some Dutch Belted cattle. He took the other man's statement of what they were worth at its face value and it had to be discounted very largely. He wanted something different. The second man may have a true and just liking for some different breed. He may honestly have thought that the first man did not really choose the breed that was best adapted to his locality, but you can afford to put your prejudices in your pocket, and the best thing for you to do, even though you recognize that it probably is not really the most desirable breed, is to start with the same kind of animals, and put two together where there was but one, and you will have four times as much influence as the first man had.

"It seems to me that these are the things that we pure-bred breeders have to take into consideration from now on: We have to have more pure-bred animals; we have to have better pure-bred animals, as shown by advanced registration; and we have to disseminate them more thoroughly in our own communities. And our own community means first our township, then our county, then the state, and then the nation."

JERSEYS

Registered Jerseys

We raise 15 to 20 calves yearly, consequently have an equal number to dispose of from the herd.

Now for sale—six bulls, 2 to 9 months old; two heifers, 10 and 11 months old; all sired by Imported Grandson of Noble of Oaklands. Also four or five fine 3-year-old cows, now milking. E. G. Roberts, Proprietor.
Roberts Poultry Farm, Ft. Atkinson, Wis.

Jersey Crest Farms

are offering

Bulls and Bull Calves

which are a credit to the breed. Bred for type and production. Let us send you pedigrees and description. Jersey Crest Farms, Oconto Falls, Wis.

Jersey Bulls

FOR SALE

A son of Golden Maids Viscount, No. 113344, dropped May 10, 1917, now ready for service, 2 bull calves about three months old, and 1 one month old, all from register of merit cows.
FRANK P. CURRAN, - TAYLOR, WIS.

Burn Brae Jerseys

Every bull over 8 mos. old is sold, but we have some fancy calves

from Register of Merit dams sired by Ibsen's Chief who won the A. J. C. C. gold medal for Grand Champion at the Wisconsin State Fair, '17.
CHAS. A. PETERSON, Rosendale, Wis.

JERSEY BULL CALF

STRAIGHT ISLAND BREEDING. Dropped March 18, 1918, solid color. Sire—Imp. son of Noble of Oaklands. Dam—Granddaughter of Derry's Golden Jolly and St. Clairs Fox—in R. of M. class A. A. 642.92 lbs. butter.
Ceylon Court Farm, Lake Geneva, Wis., G. D. Gilbert, Supt.

JERSEY BULLS

Valley Farm is offering young bulls from 2 mos. to 18 mos old, sired by Noble of Avranche 92571 and Golden Maid's Viscount 113344, both Imported sires. Will sell cheap to make room. Write
FRED STUBLEY, BLACK EARTH, WIS.

REGISTER MERIT JERSEY HERD

At Head, *Mona's Jacoba Premier* grandson: *Pogis 99th of Hood Farm*. Dam, *Mona's Jacoba*, record 806 lbs. butter; Granddaughter, *Jacoba Irene*, young stock; *St. Lambert* breeding for sale.
R. C. GREEN & SON, ALBION, WIS.

HILLCREST JERSEYS

Write me for descriptions and prices on several head of officially tested cows. Also bull calves out of tested dams. Address
ROLLIE VANDERVORT, Tomah, Wis.

Register of Merit Jerseys

We bred the highest record Jersey Cow in Wisconsin. Our cows won prizes in the Wisconsin Dairy Cow Competition. Our sires are well known. We have the best of breeding. Our herd bred for type and production. Send for pedigrees, etc.
J. Q. EMERY AND SON, - Edgerton, Wis.

You should head your herd with the very best butter bred bull, it is possible to get.

This week we are offering you a full brother to Raleigh's Foxlett 11734 lbs. milk, 535.87 lbs. butter at 1 yr. 11 mos. of age. He was dropped May 23d, 1918, is a very fine individual and carries that pronounced dairy type that produces at the pail. He carries the blood of Raleigh, Oxford Lad, Financial King, Jimp, Fancy Harry, Flying Fox.

We also offer his half brother sired by Oxford You'll Do a best bred son, dropped June 13, 1917 and ready for light service. This fellow is good enough to win in hot company.

These bulls have the same dam, a large smooth cow, large square udder and teat on each corner. She has given up to 52 lbs milk a day on herd feed: she is the kind of mother for herd bull, she is 25th Financial King breeding.

Your choice $250 00 delivered anywhere in the U. S. For further particulars address or come to

MEAD SIDE FARMS,
MEADVILLE, PENNA.

We have other bull calves sired by good sons of Oxford You'll Do and Gamboga Knight.

Dairymen Attention

We have several bull calves and Two Bulls ready for service. Rich in the blood of the Grand Champion Producing Cow, Sophie 19th of Hood Farm, seven years' tests 91,869 lbs. milk, 6,600.8 lbs. butter; Hood Farm Pogis 9th, Champion Sire, sire of 79 and 24 producing sons; Hood Farm Torono, sire of 73; 6 over 1,000 lbs., 16 over 800 lbs., sire of 21 producing sons. The use of a Hood Farm bull carrying this prepotent high producing blood, means increased production in your herd. Write for prices, etc., to
HOOD FARM, - LOWELL, MASS.

The Per Cent of Fat in Sour and Sweet Cream

HOARD'S DAIRYMAN:—Does cream test more when it is sour than when it is sweet? This question has been asked many times, especially during the past two years, and it no doubt has caused much trouble. Many have been lead to believe that by holding their cream until it was real sour they would be given a higher test. This would be possible under one condition and that is, if a can of cream was allowed to stand for a long time at a rather high temperature, there would be enough moisture evaporate to increase the per cent of fat slightly, but this would be very slight and in that length of time the cream would no longer be fit for food. Still this would bring no higher price for the product as the extra per cent of fat would only make up for the amount of moisture which has evaporated.

To illustrate: If there were 80 lbs. of sweet cream, testing 30% fat, in this amount there would be just 24 lbs. of butterfat. Supopsing this were allowed to stand until five pounds of moisture has evaporated, this would then leave 75 lbs. of cream testing 32% fat. It would also yield 24 lbs. of butterfat and it is needless to say that the butter made from this 75 lbs. of so-called cream woud not be fit for human consumption.

Those who tell the cream producer that cream will test more if it is sour, could do no bigger injury to the dairy industry, as surely he must realize the effect this would have on the quality of the butter produced, and the price.

On the twenty-second day of May, 1918, the question was again asked in this way, "How do you know cream will not test more when it is sour?" On this same date the writer tested eight different samples sweet, of one pint each, using retested glassware and one of the best cream scales the market has to offer, making these tests in duplicate, and found that they ran as low as 16.5% up to 38%. They were then kept in air-tight bottles and sealed with paraffin to prevent the escape of any moisture. They were held at approximately 80°F. for ten days. They were then tested again, using the same test bottles to avoid any possible error and again tested in duplicate. The first results were not at hand while the latter were being read. In comparing the two results they were found to be exactly the same.

It may be true that in some cases a higher test has been reported when the cream was sour, especially in thin cream. If a can of cream has been allowed to stand for any length of time and becomes sour, the milk solids settle and become very sour and firm, this making it almost impossible to get the can of cream thoroughly mixed. Therefore the sample which is taken will not represent the contents of the can it is taken from, as you realize there would be practically no fat in the milk solids which are left unmixed. Therefore many have been lead to believe that cream would readily test more when sour. If a higher test is given it is neither fair nor accurate.

E. O. HANSON.
Minnesota College of Agriculture.

Curing Makes Wisconsin Cheese New York Cheese

HOARD'S DAIRYMAN:—Apropos of your editorial on "Increasing Cheese Consumption" (page 988 July 5) would say that I have seen New York cheese advertised prominently in store windows in Madison, which was quite a surprise to me (I came from New England recently) in these times of transportation troubles and of increasing supplies of Wisconsin cheese suffering for want of adequate consumption. Upon looking into the economics of the question I was given to understand that much of the cheese sold as New York cheese is really the Wisconsin product but that it has been properly aged and may or may not have had a "ride" to Chicago and back. It seems that "Wisconsin cheese" has been allowed to mean to the consumer a more or less India-rubber-like product. I, for instance, have had it served to me and didn't like it, though I am very fond of good cheese. If Wisconsin cheese can be held a year and then be sold as "New York Cheese" at a price some five cents a pound more than "Wisconsin Cheese" it would seem to me that Wisconsin cheesemakers and dealers should see to it that a sufficient quantity of cheese be held long enough to make it good to eat and then drive everything but Wisconsin cheese (except possibly the well known imported brands) out of the Wisconsin market. Green cheese won't do this.

SAMUEL WEIS MENDUM.
Wisconsin College of Agriculture.

SWINE

Cedar Crest Farm Berkshires
Cholera Immune
The wonderful bargains we offered in Berkshires were so quickly taken advantage of that we have not a single boar of serviceable age for sale and only a few brood sows, weighing 250 to 300 lbs. bred for their first or second litter and a limited number of unbred fall gilts. Our stock is right and our price is right. Write us today for complete information. Remember—first come first served—the quicker your order is placed the better the selection to choose from.
CEDAR CREST FARM, J. K. Dering, Prop., Lake Villa, Ill.

BROWN SWISS

Walhalla Farms
Pure-Bred Brown Swiss Cattle
Only high class, well bred animals from a clean and healthy herd offered for sale. More than 100 head to choose from and our 20 years' experience is back of every one. Write us now.

Milford Meadows Stock Farm

Now Offers For Sale

M. M. Rag Apple Oak Denver

A most promising young sire, born June 4, '17. Nearly half white and an exceptionally good individual.

His sire is Dutchland Creamelle Denver Prince, a 36.25-lb. grandson of Colantha Johanna Lad.

His dam, Milford Josephine Oak DeKol, made 22.82 lbs. butter as a junior 2-year-old in June. Her sire is a son of Canary Paul Fobes Homestead and from a 29.55-lb. daughter of Homestead Junior DeKol. Her dam, 31.77 lbs. butter, 616.2 lbs. milk, is a granddaughter of Dutchland Sir Pontiac Rag Apple.

The three nearest dams of this young sire average over 30 lbs., one a junior 2-year-old. His dam is one of our good prospects and is to be retested this winter.

Milford Meadows Stock Farm, - Lake Mills, Wisconsin.

Cloverlawn Johanna Piebe

His five nearest dams average 1,070 lbs. of butter, 23,809 lbs. of milk a year. Highest yearly record bull of the world 2 years old or over. Choice young bulls from our large yearly record cows for sale. 125 head. 29 yearly record cows. State exactly what you want.

JOHN PULS, - HARTFORD, WISCONSIN.

RICHLY BRED HOLSTEIN BULLS

from 5 to 16 months of age and sired by King Korndyke Veeman, the bull with 40-lb. breeding, whose two nearest dams average over 37 lbs. butter in seven days. These bulls are out of cows with large A. R. O. milk and butter records. Write us for full particulars.

Wisconsin Star Stock Farms, Ed. M. Schultz, Hartford, Wis.

A Few Good Ones For Sale

I am offering yearling and bred two-year old registered heifers for sale. Daughters of King Segis Pontiac Polkadot 8th, he a grandson of King Segis Pontiac and from one of the good daughters of Johanna McKinley Segis. A number of these heifers are bred to Sir Aaltje Pontiac Hengerveld, a 33.68-lb. son of Hengerveld DeKol Beets. Also several good young bulls from A. R. O. dams and a few cows in calf to the 33-lb. bull. Write me or come and see them for yourself.

J. D. McDONALD, WEST SALEM, WISCONSIN.

QUACKENBUSH for QUALITY HOLSTEINS

Must Reduce My Herd

Because of lack of barn room. I am now offering for sale some excellent yearling and 2-year-old heifers and a few young bulls. Sired by King Segis Pontiac Polkadot 8th, a grandson of King Segis Pontiac and Johanna McKinley Segis. Some of the heifers bred to Rag Apple Pontiac, a 30-lb. brother to Rag Apple Korndyke 8th. A few of the young bulls sired by him. Write for full information.

W. W. QUACKENBUSH, WEST SALEM, WIS.

JOHN HETTS, FORT ATKINSON, WIS.

Walcowis Farms

OFFER SON OF

IOWANA SIR OLLIE

Sire of state record jr. 2-yr.-old. Dam, a granddaughter of King of the Pontiacs and first prize winner at National Dairy Show, made 27.70 lbs. butter from 624 lbs. milk in 7 days. Best day's milk, 101.5 lbs. Calf was born April 8, 1918, is evenly marked and a splendid individual. Write now for price, pedigree and photo.

N. DICKINSON & SON, Lake Geneva, - - Wisconsin.

FOR SALE—Registered Holsteins

Young Bulls—5 to 10 months old, 2 sired by Johanna King Segis, the 40-lb. bull; 1 by the show bull, Beauty Walker Pietertje King; 2 by our splendid senior herd sire, Czar Walker 2d. We also have 7 beautiful heifers 4 to 15 months old sired by King and Czar above mentioned. *Eight well bred cows,* safe in calf to Czar 2d, offered. Must sell because of shortage of feed. Breeders, not dealers.

Elm Leaf Stock Farm, Bear Creek, Waupaca County, Wis. Jas. McKone, Prop. Wm. Lucia, Manager.

$25 Holsteins $25

Five weeks old 15-16 pure, mostly white, $25 crated. Two months old, $40. Registered Bulls two months old best quality $65. Two-year springers $125. Cows crated $150. Write us for car lots. Buy the best—it pays in the end.

DR. J. A. ROBERTS STOCK FARMS, OCONOMOWOC, WISCONSIN.

Fairview Stock Farm Holsteins

For Sale: 3 yearling heifers sired by Sir Korndyke Hengerveld Grouw, whose dam is a full sister to Pietertje Maid Ormsby. Also one bull ready for heavy service. Write your wants. FAIRVIEW STOCK FARM, W. G. Marshall, Prop., Whitewater, Wis.

King Pontiac Champion

Is now five daughters nearer the century mark, having 80 A. R. O. daughters in all to his credit. Of this number three are State Champions in the 7-day division, one in the 30-day, one in the yearly and another has the distinction of holding the highest 30-day butter record of any cow living in the state. In view of the fact that King Pontiac Champion is now in his prime and in the finest physical condition, that he is at the head of a herd where his daughters will be given the best opportunity for future development and that the production of King's daughters in both short and long distance tests excel those of any other sire of the breed, where can you select a sire whose progeny has a more promising future?

Our prices are reasonable. Write for sale list before selecting a herd sire.

PABST STOCK FARM, Oconomowoc, Wis.

Beaumont Farm Has a Young Bull Sired by King Colantha Rag Apple

positively one of the best sons of RAG APPLE KORNDYKE 8TH. Dam a 32½-lb. granddaughter of the KING OF THE PONTIACS.

YOU CANNOT GET ANYTHING BETTER THAN THIS. Another young bull, out of one of the finest daughters of JUDGE SEGIS, which recently sold for $10,000. Remember that KING COLANTHA RAG APPLE is a brother to the $53,200 bull.

BEAUMONT FARM, MT. SAVAGE, ALLEGHANY COUNTY, MARYLAND.

Do You Want Her Blood?

Bess Burko Ormsby. Butter 7 days 42.31.

THE BEST BRED 40-LB. COW IN THE WORLD.

$400 Buys This Yearling Bull Rich in the Blood of the Famous "Bess Burkes"

THIS IS YOUR OPPORTUNITY, Mr. Small Breeder, to get the same blood that your big neighbors pay thousands for.

THE BULL IS A SPLENDID individual, well grown and ready for heavy service.

STUDY HIS PEDIGREE for a moment—it is worthy of considerable thought.

HIS SIRE IS Sir Pietertje Ormsby Mercedes 41st, the only full brother to Bess Burke Ormsby, the best bred 40-lb. cow—

AND ALSO TO Bess Pietertje Ormsby Mercedes, the former world's champion milk producer with 33.15 lbs. butter and 759 lbs. milk as a junior three-year-old.

AT FIVE YEARS, this same cow made 1,235 lbs. butter from 29,000 lbs. milk in a year, one of the highest combined milk and butter records ever made.

THESE FULL SISTERS and Sir P O M 41st are sired by Sir Pietertje Ormsby Mercedes, the greatest yearly record sire of the breed.

THEIR DAM is Spring Brook Bess Burke, 34 lbs. in 7 days and 1,094 lbs. in a year and the only cow in the world having three daughters above 33 lbs.

THE TWO NEAREST dams of Sir P O M 41st and his two full sisters average above 36 lbs. in 7 days.

PRETTY HARD to improve on this, isn't it? Now, take a little more time and study the breeding of the dam—

SHE IS Canary Polkadot Wisconsin Lottie, a 19-lb. junior four-year-old daughter of Sir Johanna Canary DeKol who has 4 daughters from 30 to 38 lbs.

HER DAM is a daughter of Wisconsin Bess Chief, the sire of Spring Brook Bess Burke, 34 lbs. in 7 days and 1,094 lbs. in a year.

THIS MAKES CANARY a three-fourths sister to Spring Brook Bess Burke 2d, (the world's largest dairy cow) 38.22 lbs. in 7 days and twice above 1,000 lbs.

THE BESS BURKE breeding appears on both sides of the pedigree so strongly that there can be no doubt about the breeding value of the young sire.

HE CARRIES 62½% the same blood as the leading Bess Burkes—Bess Burke Ormsby, 42 lbs.; Spring Brook Bess Burke 2d, 38; and Bess Pietertje Ormsby Mercedes, 33 lbs.

REMEMBER $400 BUYS HIM—guaranteed sound.

Bringing the Farm to the Railroad

Since the coming of the motor car, the remote farm is no longer remote. Distance has been conquered. Miles have been shortened. Minutes have taken the place of hours spent in transportation.

In this transformation, the most important advantage to the farmer is in being brought next door to the railroad.

Milk and other perishable products can be marketed quickly. Needed supplies are more available. The farmer is in direct touch with the world.

Using his car largely for business, the modern farmer treats his car as a business proposition. Equipment is purchased with extreme care and judgment. Values are studied. Mileage records are kept carefully.

That is why the sales of United States Tires are increasing so fast in prosperous farming communities. They have demonstrated not only long-mileage qualities but greater reliability. They make your car more useful. They give a bigger return on your investment.

United States Tires are Good Tires

Wherever you live or whatever car you drive, there is a United States Tire built especially to fit your conditions. You have a variety of treads and types from which to choose but the quality and values are always United States standards.

Any United States Sales and Service Depot will cheerfully aid you.

For passenger cars—'Usco', 'Chain', 'Royal Cord', 'Nobby' and 'Plain'. Also Tires for Motor Trucks, Motorcycles, Bicycles and Airplanes.

United States Tubes and Tire Accessories Have All the Sterling Worth and Wear that Make United States Tires Supreme.

'Usco' 'Chain'

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LVI | FORT ATKINSON, WIS., AUGUST 2, 1918 | Number 2

Future of The Dairy Industry

E. W. SIMONS, Wisconsin

DAIRY farming is not one of those industries that is wholly and essentially man made. It is not an industry built on some mere whim of human nature, or on some passing fancy such as that on which the bicycle business was built. Man existed and man was happy before ever bicycle was invented, before ever house was built, before gold was transformed into jewelry.

But can you imagine a time when man could be happy or when man could even exist without food? The dairy industry is founded on that God-given element in human nature that is so much in daily evidence from the day of birth until the time of death—hunger, the need of food. Food is vital. To satisfy hunger, man will sell his home, his automobiles, his household goods. If it can be obtained in no other way, man will fight for food, because self preservation is the first law of nature.

Now the cow is not only a producer of food but the food this four-legged factory turns out is one of the most important to humankind. There is one point—a somewhat recent discovery—with which you may be familiar but which has received too little publicity as yet and which I would like to mention.

The other day I stopped a local physician on the street and said to him, "Doc, what do you know about butter?"

"I know a lot more than I did a few weeks ago," he replied. "I had children in three different families under my care who were not doing well. Nothing specific was the matter with them, but they were not growing, not developing the way they should. In the first case I prescribed certain medicine and, knowing that the child had not been drinking milk, also told the parents to give her plenty of milk and butter. There was such a decided change in the child within a week that I made up my mind it was not the medicine that was responsible. On investigation I found that the child previously had been eating butter substitutes, and I decided that the butter and milk caused the improvement. I then told the parents of the other children to spend their money for butter instead of medicine and doctor's fees, for in those other cases I found they had been using butter substitutes also. You ought to have seen those kids two weeks later."

At the Wisconsin Dairymen's Association last winter, I heard Miss Amery of the University of Wisconsin say in her address that in the war hospitals of Europe it was found that wounded soldiers who did not have milk and butter recovered but very slowly from their wounds. These same men given a liberal supply of milk and butter healed their wounds quickly.

BROWN SWISS OWNED BY JOHN INGOLD DAIRY FARM, WISCONSIN

Not only does the dairy cow produce food, not only does she produce a cheap food—indeed, perhaps the cheapest, not only are dairy products important as food for human beings, but, in the light of recent discoveries, we must look upon milk as the indispensable human food. The dairy industry then is not a business built upon some passing fancy or transient fashion; it is built upon the firm foundation of human need that will surely last so long as human nature endures.

The Distant Future

So much for the foundation on which this industry is built. Now let us theorize a bit as to the more distant future of the business. The density of population of the United States is about 16 people per square mile. In Europe it is 120. Dean E. Davenport has calculated that by the end of the present century there will be about twelve hundred million people in this country. That would mean a density of population of about 200 people per square mile as against the present density in Europe of 120. Think how the population of the United States has steadily increased within our own memory and it is easy to understand the probable accuracy of Dean Davenport's prophecy.

Couple with that prophecy another. The late James J. Hill when discussing the food supply of the future (and who was more competent in his time than he), prophesied that by the middle of the present century there would be a wheat shortage of 400,000,000 bushels.

If Davenport and Hill are correct there is to be a tremendous increase in the population and an enormous grain shortage. What has that to do with the dairy industry? The cow, that marvelous food making machine, eats things which of themselves are not fit for human consumption—grass, hay, corn stover, alfalfa, those offals of the milling processes, bran, oil meal, corn germ meal, and brewers grain, and other waste which human beings cannot eat, and converts them into indispensable human food.

It is true that these inedible products are also made fit for human food through the agency of the hog and steer and sheep, but the dairy cow is the most efficient of them all.

The cow not only produces more food per day but also produces it from less—she transforms a higher percentage of the feed which she consumes into human food which we can eat.

Then, too, in the production of beef or mutton or pork, grain is required—good, sound grain that can be ground into flour. The cow will produce milk entirely from feeds which of themselves are not suitable for human food. The cow not only frees large quantities of grain for our use, but in the conversion of large quantities of roughage into human food, the dairy cow is performing another service. The growing of grain or any other product of the soil suited for human food rapidly depletes fertility; the dairy cow replaces this lost fertility.

As the population increases, becomes more dense, and a shortage of foodstuffs for human-kind becomes acute, the importance of the dairy cow and her product, generation by generation, will steadily increase.

The Near-by Years

Turn now to the more immediate future.

This world war is working vast changes that will tremendously affect American dairymen. Our Department of Agriculture says: "The Continental dairy countries imported much of their feed before the war. The war brought about a reduction of such shipments. There wasn't enough ocean tonnage to be spared for hay and concentrates because guns and powder and human food were the urgent military needs. At the same time armies and civilian population had to have more meat, so dairy cattle were killed to supply this demand and because there wasn't feed enough to keep them alive." Because of this slaughter of dairy animals abroad and because of the decrease in European milk production per cow, the demand of this country for butter and cheese and condensed milk has grown by leaps and bounds and continues to grow. Our exports are limited apparently only by the available space in ships. Since the beginning of the war our dairy imports have decreased, while our exports of butter have jumped 700 per cent, of cheese more

Subscription in United States and Mexico $1.00 per year; 6 months, 50 cents; 3 months, 25 cents. Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through Wm. Dawson & Sons, Cannon House, Breams Building, London, S. C., Eng., or their agents, including the news dealers and book sellers in all foreign countries.

Subscription agents for New Zealand—Bray Bros., Agricultural Hall Building, Dunedin, New Zealand. Also—The New Zealand News Co., 150 Wakefield St., Wellington, N. Z.

Subscription agents for Australia—Australasian News Co., 226 Clarence St., Sydney, Aust.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $2.56, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of the Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome immoral and quack advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

System in Butter Shipping

The Gleaner Clearing House Association publishes a letter from a creamery operator who has worked out an admirable system in shipping butter. The letter is here quoted:

"We shipped you today 100 tubs creamery butter, net weight 6409½ pounds. Each tub is weighed with liner just before packing. The butter is weighed back before salt is put on top and one-half pound is allowed on each tub for shrinkage. I have a record of each churning, each churning is numbered. The number is on the cover, also the net weight. By sampling one tub of each number you will have the quality of each corresponding number."

"If for any reason you wish to refer to some certain tub or tubs of butter, please give me the number on the cover. They correspond with my records. You will find enclosed weight of each tub."

Stringy Milk

Stringy milk is caused by bacteria which enter the milk after it has been drawn from the cow. It is not caused by the feed or any abnormal condition of the cow. Milk affected in this way is not unhealthful, but it is certainly not appetizing. The bacteria which caused the trouble live in water ordinarily, and probably enter the milk from the outside of the cows' bodies, or from utensils. Where trouble is had from this condition, the utensils, especially the strainer cloth, should be boiled. If this treatment does not eliminate the trouble, the fresh milk should be heated on the stove to a temperature of 150 degrees, then let stand 20 minutes and cooled as quickly as possible, according to C. H. Eckles of the Missouri College of Agriculture.

W. LIVINGSTON LARNED

He Loves Them All

Bess is fond of kickin',
Belle eats onion grass.
May, she needs a lickin';
Mean, bad-tempered lass!
Josie takes to strayin'.
Maud steps in th' pail;
Jess—too fond of playin',
Rose knocks down a rail.

Queen, she's always "mooin'",
Marge, her coat is rough.
Kate keeps trouble brewin'
Lucey's ways are gruff.
Each and all have failin's,
Grunts and grouches, too;
Temper fits an' ailins—
Just like humans do!

"Yes, sir," said the earnest auctioneer, "this animal is all pedigree. His sire was West Minister III and had three daughters in the Grand Exalted Register of Merit; his dam, grandam, and great grandam are all in the R. of M. I can tell you more if you want to know it."

"Nope," spoke up a fellow in the crowd, "the darn critter has more pedigree right now than my own grandfather. We couldn't keep him on the farm without disrespect to our own ancestors."

"General Crowder's 'Work or Fight' scheme may pan out nicely," said Ezekial Arrowroot of Hillcrest Dairy, "but up to date it has sent three college professors, an optician, an elevator boy, and six actors to my farm, and teaching 'em how to work is harder than doing it myself."

Philosophy of the Oldest Dairyman

"'Swat the Fly' ought to have been invented for the sake of hosses and cows."

"Is there greater reproach in the world than the look a sheep gives you just as it crawls up out of a disinfectant dipping vat?"

"Milkin' machines are a logical part of modern invention, but just the same it takes a lot of the romance out of the dairy business."

"They teach young folks dairying nowadays just as they teach arithmetic or grammar. And I want to tell you, there's as much profit an' honor in comin' out a graduated cheesemaker as an expert accountant or a historian."

"When a farmer goes joy-riding in his pleasure car, he's apt to have one arm around a bag of potatoes."

Things That Never Happen

A windmill that won't squeak.
A calf that isn't hungry.
A bull that isn't looking for trouble.
A farm hand who wouldn't rather loaf.
A rooster that won't eat sunflower seed.
A lightning-rod agent that couldn't talk.
A mud road that is better than concrete.
A prize winner who thinks his cow didn't deserve it.

As the Youngsters See It

Little Helen was spending her first summer on a farm. It was a dairy farm and a very large and prosperous one. That night, when she said her prayers at her mother's knee, she murmured in a very low and tremulous voice:

"Please, Lord, forgive me for drinking so much milk. I didn't know I was taking it away from the calves."

You Can't Afford This

No farmer is rich enough to feed 40-cent butter to his hogs or his calves in partially skimmed milk.

It's a waste of money.

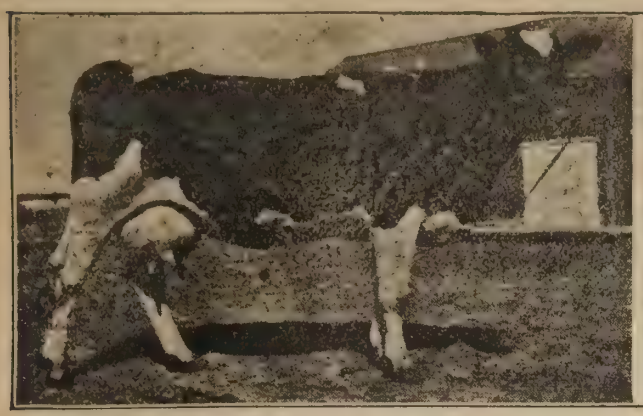
It's a waste of food.

It's a waste that your pocketbook, your neighbors, your country, all condemn.

But it's a waste that is going on today on every cow-owner's place where an inferior or half-worn-out cream separator is being used, or where the farmer is skimming by the wasteful "gravity" method.

And its a wholly unnecessary waste, too.

Because a De Laval Cream Separator will soon save enough cream to pay for itself, and put a stop to all the waste of cream and time and labor for many years to come.



There is no other cream separator that can compare with the De Laval in clean skimming, capacity, ease of operation, freedom from repairs, and durability. It's the world's greatest cream saver.

Order your De Laval now when you need it most and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or, if you don't know him, write to the nearest De Laval office as below.

The De Laval Separator Company

165 Broadway, New York **29 E. Madison St., Chicago**

FIFTEEN YEARS OF RECORD KEEPING

Princess Belle Columbus 2nd; one day, 96.9 lbs. milk; 7 days, 629 lbs. milk containing 23.58 lbs. fat; 30 days, 2,715.9 lbs. milk containing 96.03 lbs. fat; one year, 15,211.7 lbs. milk; 4 years, average, 11,799.2 lbs. milk.

The farm home on Prairiedale Farm, Illinois, where a herd of Holsteins has been developed which for the past 4 years has a yearly average of more than 10,000 lbs. milk per cow.

Princess Belle De Sota 2nd; one day, 94.7 lbs. milk; 7 days, 627.9 lbs. milk, 20.53 lbs. fat; one year, 13,829.9 lbs. milk; 4 years, average 12,447.2 lbs. milk.

SINCE 1903 the milk from every cow on Prairiedale Farm, Illinois, has been weighed throughout every lactation period. A herd of Holsteins was founded in that year by Paul T. Galt and F. W. Spencer, who are now on their sixteenth year of a successful partnership.

Prairiedale Farm has two special lessons for dairy farmers. One concerns the results secured by starting into dairying with the determination to win and being continuously active in improving a herd of cattle through testing. A few facts which long years of testing have shown on this farm are here recorded. The other lesson can be gained only by more personal relationship to this sixteen-year partnership of Holstein breeders than the pen gives. It is for those men who cause so many foundation, or older, herds to be dispersed because of disagreement among the owners.

Twelve years ago the average annual production of the milking herd was 5,926.1 lbs. milk; 10 years ago, 6,484.1 lbs.; 8 years ago, 7,037.1 lbs.; and 5 years ago, 8,172.3 lbs. For the last four years cows of this herd have the remarkable yearly average of 10,000 lbs. milk each. The milking herd has averaged to number nineteen head during this period. Of the twenty-one head in milk last year, only nine or ten were of full age. The twenty-one head averaged 10,716.6 lbs. Lady Johanna Fairmont Maid, one of the older cows in the herd, has an average milk production for the past six years of 11,865.6 lbs.; Princess Johanna Columbus, 9,107.7 lbs. for an equal period; and Johanna DeKol Fairmont Maid, 9,416.1 lbs. for the past five years. The yearly milk production of the last four years of five other cows averages 11,660.8 lbs.

This production was made with twice-a-day milking excepting for the period of seven and fourteen-day official tests and for one thirty-day test. In the past three years forty-seven Advanced Registry records have been made. Five cows have milked from 92 to 96.9 lbs. milk in a day, one making 95 lbs. on three-times-a-day milking. Seven have average records of over 600 lbs. milk in a week.

Mr. Spencer well describes the course which has been followed from the beginning in 1903:

"We started in the dairy business with five pure-bred Holsteins. The rest were just 'any old thing' we could pick up at sales. Of course, we tried to get good ones, but you can't do it; you get stung and the cows do not give enough milk. Our herd is now all descended from five head, one of the original cows dying soon after we bought her, but then we bought another foundation cow about five or six years ago. Paid over $400 for her at thirteen months of age, bred to one of the best bred bulls in the East. This $400 cow is the only one of the Prairiedale Farm herd that was not born on this farm. We have 74 head here now, all pure-breds, all born here but the one; all the milk cows are A. R. O. and all the young stock are from A. R. O. dams except one heifer.

"We have milked these cows regularly for nearly four years now with a mechanical milker and can see no ill effect from the use of a machine. It has not brains. Believe most of these men who claim that the machine is a failure should turn it around; perhaps it is the man who is a failure.

"If every young farmer could be persuaded to invest in two or more pure-breds when he starts farming, wouldn't the dairy industry be interesting and lively in ten or fifteen years? They cannot go wrong."

Princess Harcourt De Sota; 7 days, 483.3 lbs. milk, 18.66 lbs. fat; one year, 9,928.4 lbs. milk; 2 years, average, 9,258.6 lbs. milk.

Zerma Harcourt Columbus; 7 days, 416.3 lbs. milk, 18.627 lbs. fat; one year, 10,266.3 lbs. milk.

Johanna DeKol Fairmont Maid; 7 days, 572.8 lbs. milk. 22.52 lbs. fat; one year, 10,327.3 lbs. milk; 5 years, average, 9,416.1 lbs. milk.

Organizing for Feed Defense

SANDERS SOSLAND, MISSOURI

V. ALFALFA SUPPLY AND PRICES

WAR feed clubs and other buyers planning to purchase alfalfa hay jointly or individually have little or no reason for waiting. These prospective buyers are, of course, more interested in alfalfa than ever, for, with feed in general high, the economy in the legume is more widely appreciated than heretofore. While the legume is not cheap at the present level, conditions incident to the production of this crop are such that dairymen and others who are studying the market with the intention of laying in a supply should reach an early decision. This decision, it seems quite plain, should be to make purchases during the present summer and not defer buying much longer, if at all.

The fact is that this year, as indicated by the character of the season and the cuttings obtained thus far, promises to be one of short production of alfalfa. Corn and oats are far more promising, and may have some effect on the market for alfalfa, but the general opinion of the hay trade is that alfalfa is around its low level on the new crop under war conditions.

Some purchasing leaders of war feed community clubs express more or less uncertainty as to the advisability of contracting for their winter supply of alfalfa hay at the present level of prices. Still, the range of prices quoted on alfalfa hay offers a temptation to the feed organizations, for, when compared with the level prevailing during the winter months the past year, the market is low. Besides, alfalfa hay at the present level ranks as one of the cheapest feeds available for dairy cattle. Prices are practically the same as at this time a year ago, the best quality hay selling at a range of $21 to $22 a ton, in carlots, on the Kansas City market. In the month of December, 1917, and in the early part of 1918, alfalfa hay met with an eager demand as high as $35 a ton in Kansas City. Incidentally, Kansas City is the greatest distributor of alfalfa hay in the entire United States, and serves as the barometer of alfalfa values throughout the country.

Inquiry among close students of the alfalfa trade situation indicates that purchases of that commodity during the summer months will prove profitable to the community organizations. Briefly, the general opinion prevails among alfalfa dealers and even consumers who follow market developments closely, that prices have reached their lowest level and may fluctuate in a course similar to that of a year ago. Of course, there is a possibility that the views of the alfalfa trade may prove to be in direct contrast with the actual developments in the market, but a study of the trade situation today leads to the conclusion that declines in prices for alfalfa are improbable.

Leaders of feed purchases in a community organization or individual buyers will do well to go back to the preceding year and acquaint themselves with the important market influences which brought changes in prices. Alfalfa was selling a year ago at practically $21 a ton, basis Kansas City. In the summer and fall months of 1917, a serious drouth prevailed over the Southwest, particularly in Texas and other surrounding southern states. The United States Government had already begun acquiring thousands of horses and mules, the number of animals in the army numbering approximately 250,000 head. The Southeast and East were buying larger quantities of alfalfa because of increased feeding operations and the adverse weather conditions. Good yields of the hay were witnessed from the first two to three cuttings and from the fourth harvest in some districts, though dry weather retarded rapid growth. The quality of the hay was high. Feeding and breeding of live stock was expanding to meet enlarged war demands, necessitating increased consumption of hay, particularly alfalfa. The outlook for production of all hay at that time was for a yield of about 95,000,000 tons. The supply of mill feeds was extremely light and the outlook for cars was dark. With these conditions, the market the past year soared to record

Stopping Leak by Creosoting Lumber

KURT C. BARTH, ILLINOIS

EVERY farmer has had more or less experience with the rotting of posts and structural wood of all kinds, and the attendant trouble and expense of replacements. In the effort to avoid repetition of such conditions, many have resorted to the employment of substitutes, some of which have not proven suitable and their use often incurring a much greater expense than was warranted. In general, the substitution of other materials for lumber on the farm has not proven entirely beneficial, and it is quite evident that wood is not only the most available building material, but also the most economical if properly used.

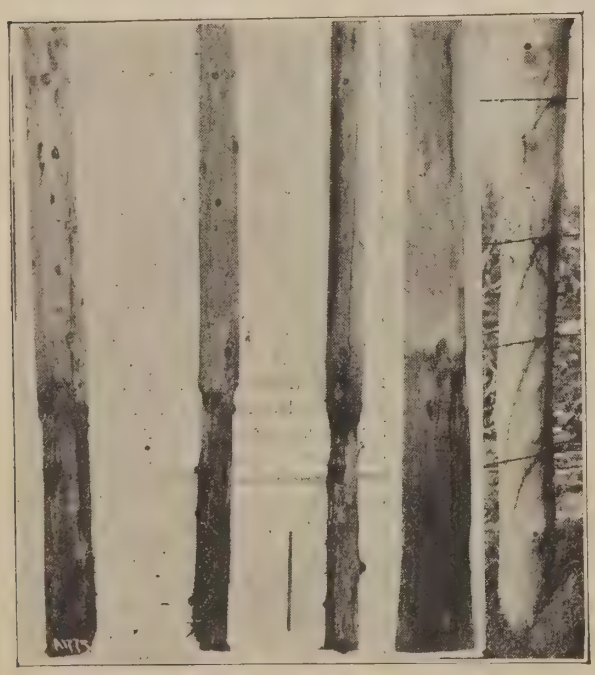
Creosoting Will Save Millions of Dollars

There is no doubt that decay of wood in farm structures causes the loss of millions of dollars annually, and that this loss must be paid for by the farmers' profits from their labor and investment. Inversely prevention of this waste will add the equivalent sum of dollars to the farmers' gains. Happily, structural wood may easily be protected from decay. Not by a new theory, but by a practice which has stood the acid test of time. The application of coal tar creosote oil has made wood more or less "rot-proof" for over three generations.

Particularly under present conditions, when the cost of building is higher than at any time during the history of building operations in this country, must permanency be given very careful consideration—especially as replacements a few years hence will very probably be equally if not more costly than now. Protection against decay will lengthen the life of rural structures and proportionately decrease their annual cost—equalizing, to a certain extent, the increased cost of today with that of several years ago. It is ultimate economy to build to last.

How can wood be made resistant to decay? Simply by creosoting, and every consumer can apply the preservative effectively with little effort. If the expenditure of five cents for preservative treatment will increase the life of a cedar fence post, which costs 25c to 30c, five years, it certainly pays. The same is true in principle of all lumber when used in any situation favorable to the development of decay; i. e., where air, moisture, and warmth are present, and where the natural life is less than the mechanical life.

Creosoting has proven the most practical method of increasing the life of wood. Coal tar creosote oil has been used for this purpose for about eighty years, and the best evidence of its efficiency as a preservative is the increasing demand which in 1913 reached a total consumption in this country of about 100,000,000 gallons. There is nothing mysterious about wood preservatives, and although proprietary and patented products, for some of which special features are claimed, have been unscrupulously promoted and sold to the public at relatively high prices, there now exist definite standards to which a preservative must conform.



PLANT FOR CREOSOTING FENCE POSTS, CONSISTING OF SECOND HAND STEEL OIL DRUM FOR HOT TANK AND WOODEN BARREL FOR COLD TANK. CRUDE BUT EFFECTIVE

CREOSOTING HEMLOCK LUMBER FOR DOUBLE WALL SILO ON A WISCONSIN FARM

The work of the Forest Products Laboratory, which is a division of the U. S. Department of Agriculture, in testing practically all known products sold as wood preservatives, and in publishing numerous bulletins containing valuable recommendations on the subject of wood preservation, is of inestimable value to the general public.

NOT CREOSOTING VS. CREOSOTING

The three posts at the left are untreated cedar posts after 9½ years' service and show how decay has injured this best known and most popular post wood. The fourth post from the left is of soft maple which has also been in the ground 9½ years. The butt of this post was soaked for 4 hours in the hot creosote oil and for 6 hours in the cold creosote oil. Note that the treated soft maple, a relatively poor wood, has resisted decay better than the more expensive untreated cedar. The post at the extreme right is an ash post after 9½ years' service, the butt of which was creosoted. The post stands firm and gives promise of future years of usefulness. (Photograph reproduced by courtesy of Iowa College of Agriculture.)

What is Required of Creosote

Wood preservation has ceased to be a means of exploiting the gullible, and is now a standard practice available to every consumer of wood. Every farmer should obtain a copy of Bulletin 744 entitled, "The Preservative Treatment of Farm Timbers," issued by the U. S. Department of Agriculture, Washington, D. C. It may be had for the asking, but should it have been taken off the free list, will probably not cost more than five cents. In this bulletin will be found what constitutes a proper wood preservative, to quote from page 7: "Coal tar creosote * * * * is in general use for preserving fence posts and other farm timbers," also "there are five chief requirements for a preservative for general use. It should be reasonably cheap, should penetrate wood readily, should not be corrosive to metal, should not evaporate or wash out of the wood easily, and should be poisonous to fungi." In other words, it must be simply pure, refined coal tar creosote oil. It is well for purchasers when they wish to buy creosote oil to insist upon a guarantee that the product offered them meets with the requirements here quoted, and also that they assure themselves that it bears the name of some manufacturer whose reputation is nationally established. To employ an inferior or inefficient product will not only cause disappointment, but the time and labor spent in its application will be an absolute loss, and in some instances may even advance rather than retard decay.

Methods of Creosoting

The standard processes of creosoting wood are (1) the Pressure Processes, (2) The Open Tank System, and (3) the Brush Method. The first are commonly employed for the treatment of railroad cross-ties, paving blocks, and timber which, when in service, is exposed to heavy wear or mechanical abrasion. They are seldom, if ever, required for the treatment of farm timber, and in fact are not available for that purpose at present. The Open Tank System consists of a "hot" and "cold" treatment of the wood in refined coal tar creosote oil, by alternate immersion and soaking for various periods, first, in a bath of creosote maintained at a temperature of between 150 degrees and 200 degrees Fahrenheit; and second, in a bath of creosote oil maintained at atmospheric temperature, but not in excess of 100 degrees nor less than 60 to 75 degrees Fahrenheit. In some cases the cold treatment is given without removing the wood from the hot tank to the cold tank by merely permitting both the preservative and the wood to cool to atmospheric temperature. The latter method is most common in the treatment of fence posts. The Brush Method is simply the painting of two coats of refined coal tar creosote oil, heated to about 150 degrees Fahrenheit, on to the lumber in the same manner as one would apply ordinary paint. If it is not possible or convenient to heat the creosote it may be applied in its natural state, providing the atmospheric temperature is not lower than 50 to 60 degrees Fahrenheit.

The Brush Method is by far the most practical for general purposes, not only on the farm but in every case where wood is to be given preservative treatment by the average consumer. Primarily, it consists of applying the preservative to all points of contact before the lumber is placed or joined, as it is at these points that decay first develops. The preservative should be used liberally. It is false economy to stint the treatment in order to save a few gills of creosote. Even if the preservative cost a dollar per gallon it would still be cheap in comparison with the results obtained from its use. Sills should be treated over all, so also any lumber which is used wholly or partly in contact with the soil, concrete, masonry, brick, or other exposed wood. In addition to preserving the wood, the application of creosote oil will make the lumber practically termin proof, which is a very desirable quality when the wood is to be employed for hog houses, poultry houses, for stalls, and for floors of barns, granaries, and corn cribs. Creosote may be applied with advantage to the interior of hog houses and chicken coops already erected and in use, but if that is done they should be vacated until the preservative has thoroughly dried. Properly creosoted poultry houses are free of mites.

Creosoted Silos

Creosoted stave silos are on the market, and if properly treated are very desirable, but farmers should convince themselves that a proper preservative has been used by the manufacturer, that he has properly creosoted the lumber, and that prices asked for the creosoting are not too high. If the treatment is inferior or a "make-shift," that is, if the staves have merely been dipped in something black to make them look as if they had been creosoted, it is little better than nothing, and it would be much better if the farmer purchased the plain lumber and brush treated it himself. To creosote silo staves or lumber by the Brush Method two coats of creosote oil should be applied, in the same manner as previously described, to the edges, tops, and bottoms, and likewise two coats to the interior and exterior surfaces after erection. No fear need be entertained that the creosote oil will contaminate the ensilage, as extensive experiments at the University of Wisconsin have proven that it does not affect the contents detrimentally, but the creosote should be given plenty of time to dry before the silo is filled.

A double wall type of silo built up of 1"x4" hemlock flooring is quite popular in Wisconsin and Michigan, and is undoubtedly a most serviceable silo when properly protected from decay.

(Continued on page 48)

Permanent Grain Storage Buildings

DEANE G. CARTER, IOWA

PERMANENT, weather proof, fire proof, and rat proof, are among the outstanding features of these combined corn cribs and granaries, designed for the general or dairy farm.

Other advantages which might be mentioned in favor of the permanent types over wood, are, that they are easy to erect, give better ventilation, have a better appearance, and the cost is but very little more than for the less permanent structures.

One only need observe the corn cribs and granaries which are twisted out of shape, broken down, and "sway backed," to understand this statement from an Eastern Iowa man: "There's more to building a crib or granary, than just erecting a shelter to hold the grain. To be perfectly frank, I have never had a granary that didn't break down sooner or later."

Permanence is one of the principal features of masonry construction. The elements do not destroy masonry buildings so rapidly, and they can be relied upon to serve for a good many more years than wooden ones. They are also a better fire risk, for there is not the danger of loss by fire, either to the building or its valuable contents.

It is stated that every rat destroys in the neighborhood of two dollars' worth of grain each year. Some form of rat guard and masonry floors will keep the grain safe from rodents. To keep the rats out of the crib, an effective method is to set a strip of galvanized iron in the fourth or fifth mortar joint above the ground. This iron extends outward and downward, about 6 inches, so the rats cannot get over it. Inside, the crib is lined with a fine wire mesh, galvanized wire, to the height of the guard.

There is some complaint made that concrete floors cause spoiled grain in the bottom of the crib. However, if the concrete is properly made, and the floor drained, this objection will be overcome. Another type of floor is made of a layer of 4 by 8 by 12 inch hollow tile, laid flatwise, and covered with about 2 inches of concrete.

Concrete and hollow tile are the principal materials used in permanent crib construction. For the footings, foundations, and driveway floors, concrete is the logical material to be used. Bin construction is of wood in all the types shown. In the majority of cases tile walls are used, although there are some cribs built entirely of concrete.

The roof covering should be of a permanent and fire resisting character. Metal, prepared roll roofing, or masonry are most often used.

The illustrations show the three principle types of permanent combined storage buildings in common use. They are the round crib and granary, the square crib with frame construction above, and the square crib and granary with a masonry arch roof.

The Round Crib

The round crib was the first one developed. In plan it is simply circular in form, with 9 to 10 foot crib, and a ventilating shaft through the center some 6 to 8 feet across, making the diameter 24—28 feet. There is no limit of height to which the round crib can be built. However, 20 to 30 feet in height is most common.

The outward pressure of the grain in this type of crib is held by steel reinforcing rods in the mortar joints between each course of tile. Over the ventilating shaft in the center there is usually a cone shaped "spreader" which distributes the corn or grain. The advantages claimed for this type of construction are that it is economical because the circular walls enclose a greater amount of space with the same length of wall. Because there are no corners to build up, the masonry work can be rapidly done with slight changes of mistakes. The circular construction also is easy to reinforce.

COMBINED GRAIN STORAGE BUILDING ON IOWA STATE COLLEGE FARM. WALLS ARE REINFORCED WITH PLASTER AT INTERVALS OF 10 FEET

This round crib cost $2,300, and has a capacity of 11,000 bushels of corn and small grain, or a storage cost of 20 cents for each bushel capacity.

Square Crib With Frame Construction

The second type of permanent grain storage, that is, the square crib with frame roof, has been in use for 4 or 5 years. The illustration shows one built on the Iowa State College Farm.

The advantages of the square crib over the round are that a driveway can easily be had without weakening the construction. It is claimed also that bins over the driveway can be arranged to a better advantage in the square crib. It is possible also to have all the elevating machinery inside and room if desired for sheller, grinder, and gasoline engine.

The biggest problem in connection with the square crib has been the difficulty of reinforcing the walls against pressure. This has been overcome by the use of columns or pilasters at intervals in the walls and connecting them with reinforcing in the mortar joints. In several cribs instead of concrete pilasters, steel beams have been used. In most cases, however, the concrete is less expensive and more easily obtained.

The cost of this crib which is 32 feet square and 16 feet to the eaves, is a little less than 20 cents for each bushel capacity.

Square Crib With Masonry Roof

The third and newest type of crib and granary is the square construction with masonry roof. Two years ago the Iowa Experiment Station designed and built a masonry arch roof with the idea of developing a type which could be used on permanent farm buildings. This roof was built with reinforced concrete ribs at intervals of about 12 feet and filled in with hollow tile construction.

Using the arch roof as a starter, and the shape of the greenhouse roof on the college grounds as a model, Mr. A. J. Wheat, an Iowa builder, has developed a masonry roof such as is illustrated by the photograph.

Mr. Wheat has built four of these combined grain storage buildings in the past year and the owners are well pleased with them. In all essential points the plan is similar to the ordinary square crib with driveway through the center and grain bins overhead.

However, the method of reinforcing the walls is different. Instead of columns in the wall these cribs have a horizontal reinforcing course every 5 to 6 feet in the height of the wall. This is made by filling ordinary tile with concrete and running half-inch square bars through them. Of course each mortar joint contains a small amount of reinforcing wire also. One of these cribs holding 9,000 bushels cost approximately 28 cents for each bushel of capacity. One 15,000 bushel crib cost 25 cents per bushel.

In general, permanent construction will cost from 10 to 20 per cent more than wood. Considering the longer life, fireproof qualities, better appearance, and rat proof construction, the cost over a period of years will compare favorably with the wooden building.

In each of the buildings mentioned, manual labor in handling the grain has been reduced to the lowest possible point. An elevator is used to unload all the grain. All bins have spouts in the bottom so that practically all the grain is taken out by gravity. In most cases the cribs have a shelling trench or a sloping floor, or both, so that one man can easily feed a large power sheller. If desired the shelled corn can then be re-elevated into the overhead bins until the owner is ready to feed it, or haul to market.

A ROUND CORN CRIB AND GRANARY, ON AN IOWA FARM, WITH A CAPACITY OF 11,000 BUS. OF GRAIN

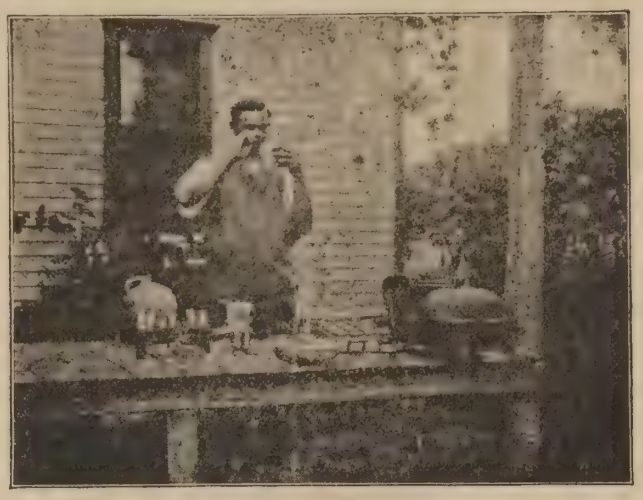
The owner reports that the cost was $2,300, or a cost of 20 cents a bushel, which included board for the laborers, hauling, and the elevator installed.

HOLLOW TILE CORN CRIB AND GRANARY WHICH HOLDS 7,800 BUSHELS CORN AND 7,200 BUSHELS SMALL GRAIN. HAS HOLLOW TILE ROOF REINFORCED WITH CONCRETE RIBS

A Farmer Critic

HOARD'S DAIRYMAN:—The writer lives in one of the most prosperous counties of Southern Wisconsin. We have the reputation of being among the most progressive farmers in the country. And yet we show a surprising tendency to lag behind when it comes to adopting modern methods in our farming operations.

And right here lies the difference between the farmer and the industrial establishment, and is the main reason for the latter having forged so far ahead in the eyes of the world. Oh, yes it has, too, and we farmers can't dispute it, although we may in a very short time.



The farmers are kicking against the price of milk. All well and good. I hope they raise it. But the farmers don't deserve to receive it until they have made every effort to be compensated to a greater extent by adopting more efficient methods and looking at things in a more progressive light.

I know a farmer who has prepared and had published in a different paper an article on the milk price question. He bases his figures mainly on his experience on his own and neighbor's farms. But he overlooks the fact that a few suggestions from his county agent and association tester would reduce his cost of production to a great extent, if only they were carried out. He is only typical of many others.

When a new invention comes on the market, pertaining, let us say, to the manufacture of traction engines, there is an eager bid for it by the various manufacturers, who are always seeking to incorporate new ideas into the manufacture of their products. But does the farmer do likewise? By no means! In the majority of cases he hems and haws, and then opines he will wait until it is tried out. And nine cases out of ten, each waiting for the other, it is a long, long time before it does get tried out.

And yet, there is positively no reason why this should be the case. Farmers, why can't we get together and see if we can't do better along these lines? Let us do our part efficiently first, in these times of war, then call upon our brothers to recognize its worth in a more substantial manner than praise.

A WISCONSIN FARMER.

Detective Work That Pays

This man is after the cow that does not yield a profit.

In this day of high priced feed, you have to know for sure that every one of your cows is earning money for you. And if you want to know the exact worth to you, of each and every cow, get

The C. P. Babcock Tester
This Style Only **$9**

complete with six bottles. 8 bottles $10—10 bottles $12—12 bottles $14. Or we can furnish a small uncovered 4-bottle tester complete with glassware for $5.25.

The test is not hard to make. It is simple and easy to understand. Just follow the full instructions which accompany each tester and you will get an accurate test every time.

Association Notes

Van Buren County, Michigan:—Pasture is very poor here due to dry weather. Consequently the flow of milk has dropped considerably. The association is starting a new year and does not as yet have a full membership. The herds in our association are mostly grade Jerseys and Guernseys, although there are some Holsteins and one registered Dutch Belted herd. The creamery pays 45c for fat. Hay has a local value of $15 per ton; silage, $10; dairy feeds, $3 to $3.25 per hundred pounds; oats, 90c per bushel; corn, $1.60; and pasture, $2 to $3 per cow per month.

Hebron, Wisconsin:—Seven slackers were sold from among the cows in this association during the month to increase the nation's meat supply and to cut out needless work. Pasture is getting short and most cows have taken a great drop in milk production. According to records so far we will have a good number of cows to enter the Register of Production list. One cow has over 250 lbs. of fat to her credit for the first three months since freshening. In June milk testing 3.5 per cent sold for $1.80 per hundred pounds. The May price for butterfat at the creamery was 47c. None of our members are feeding grain and only a few are feeding silage.

Greenwood Prairie, Minnesota:—Three low producing cows have lately been sold. One pure-bred sire has been purchased; also two pure-bred heifers. Six members are feeding grain as a supplement to pasture. The creamery pays 51c for fat. Bran costs $40 per ton; oats, $36; barley, $46; and pasture, $2 per cow per month. We have nine herds of Guernseys, three of Jerseys, eleven of Holsteins, one Shorthorn, one Red Poll, and one Brown Swiss.

Penfield, Ohio:—The May price for milk testing 3.2 to 3.6 per cent was $2.30 per hundred pounds; 4c additional was paid for each point above the required fat test.

National Meeting of Farmers

TO THE FARMERS OF AMERICA:—Victory must come from the soil. Food and men will win the war. The soil supplies both.

The men who till the soil are wholeheartedly behind the government to win the war. None have shown themselves more ready to do their utmost. The volunteers they have supplied, the money they have given, and the wonderful crops they have produced—crops greater in proportion to the number of farm workers than the world has ever seen before—prove that beyond dispute. None are more determined to leave nothing undone that will help to bring victory. With them the great question is how they can serve best. Without doubt their first duty is to supply the food without which victory is impossible.

With this fact in mind the Federal Board of Farm Organizations hereby calls upon the farmers of the United States to assemble in person, or by their representatives, in the city of Washington, August 27, 28, and 29, 1918, there to consider, decide upon, and take such action as will best promote the production of farm crops in 1919: Sufficient, first, to supply our own people, our allies, and the neutrals who depend upon us, and, second, to replenish our national reserves of grain, live stock, and dairy products, now depleted to a point where a single short crop will threaten us with famine.

America's acres can and must win the war.

Signed:—
W. T. CREASY, Chairman,
Secretary National Dairy Union;

Washington, D. C.

Center of Agricultural Production in Illinois

The center of agricultural production of the United States, according to the value of crop and animal products for 1917, is in west central Illinois as shown by a diagram just issued by the Department of Agriculture. The states of greatest production are: Iowa, $1,330,000,000; Illinois, $1,255,000,000; Texas, $1,045,000,000; Missouri, $947,000,000; Ohio, $851,000,000; Nebraska, $774,000,000; Indiana, $766,000,000; Kansas, $735,000,000; New York, $700,000,000; Minnesota, $646,000,000; Pennsylvania, $636,000,000; Georgia, $605,000,000; Wisconsin, $598,000,000; California, $575,000,000; Michigan, $534,000,000, and Kentucky, $529,000,000.—Weekly News Letter.

A Dairy Farmer's Problems

HOARD'S DAIRYMAN:—Some of the dairy farmers of our neighborhood contracted for their supply of gluten feed the fore part of June, delivery to be made at the car in July. The price agreed upon was about $50 per ton. Those who entered into this agreement are glad they did so, for the price has advanced already at this time, the middle of July, five dollars per ton, and the prospect is for still farther advances. For my own part, I never missed it a great deal by laying in a stock of grain feeds early. I have found that I could save considerably more than the interest on the money represented.

There is this about it, however, we should be pretty sure that we can store feed purchased so that the losses from rats and mice will be avoided. The havoc wrought by these pests when they once get into a stock of feed certainly is surprising. Down in the state of Virginia I once visited a farm where a fine store room of corn was absolutely ruined by rats. It makes one almost heartsick to think of the damage worked by these vermin, taking the country over. We little realize it. We know we lose some, but if we could know just the extent of our losses from this cause, I fancy we would feel that money invested in granaries that are vermin proof was well laid out.

Our price for July milk, as fixed by the Federal Commission, acting in connection with the Dairymen's League and the milk handling organizations, is 44c above that for the previous month and therefore represents a distinct advantage to the producers. For three per cent milk we get $2.25, with added points for barn scores and other up-to-date improvements. This is very satisfactory and helps to make up for the losses of other months when we were receiving much lower prices.

In one or two particulars, however, we feel that there might be a change for the better. In the first place, it is not very comfortable to come right up to the beginning of the month and not know what the price for milk is to be, and with no positive knowledge whether our markets will be continued at all or not. This state of uncertainty is a source of anxiety to our farmer folk. Not only that; we cannot very well go ahead and make our calculations for the future as we might otherwise do. Then, too, it makes our farmers uneasy to have so much sharpshooting among those who are in one way or another connected with the League and the distribution of milk in our big cities. Charges of all sorts against men who are in positions of trust make us wonder just what the truth is. Have we, as some say, a lot of unreliable, if not really crooked men at the head of things? Or is there more or less personal feeling about the matter? The average man wants to know about this.

One thing is sure. Nothing is gained by controversies over the ability or the integrity of those who have been elected to representative offices in our dairymen's organizations. The best way is to go on quietly, supporting our officials to the best of our ability during their term of office. Election time may be trusted to straighten out all tangles. In almost every instance it is found that those in trust are doing the very best they can under the circumstances—just as you or I would do were we in their positions. It is human nature to be suspicious of those in authority, and it is a pity that this is so. We are altogether too apt to find fault with men in power. That is why it hurts any organization to have these jangles. I have known of more than one milk concern to be ruined by jealousy among the members. On the other hand, some organizations made up of farmers organized on a co-operative basis are to my personal knowledge, and have been for years, working in perfect harmony. It takes forbearance on the part of all to bring about such ideal relations, however. Wherever this exists the result is a strengthening of confidence on the part of all, as well as a profitable transaction of business.

Almost every day we hear somebody say that there are not cows enough in this country. We are being urged on every hand to grow more calves and bring them to maturity. All sorts of evils are predicted if the shortage of cows is kept up. But I maintain that there are altogether too many cows in this country today. For a good many years I have been glad to see the meat men drive away cows from the farms of my neighbors. I have said to myself when I saw these animals going out, "There goes one more poor cow. It is a good thing for us all. Now if that man will only put a better cow in the place of the one that is gone, the world will be the better for it." Only yesterday I saw a bull going up the road at the tail end of a butcher's cart. I was sorry for the bull that was going to his slaughter, but my heart rejoiced for the man who had sold him.

The fact is, we do not need more cows. The more we have of the kind to be found on the average farm, the worse off we are. What we do need is more good cows. What a burden it would lift off the poor, bent shoulders of the farmers of this country if they could free themselves of the thousands of cows that simply board on their owners year after year. never making any adequate return! We work ourselves half to death to maintain these worthless cows. The time has surely come when we ought to get above this sort of thing. The man power of the farm is greatly reduced. We have none to lay out on poor cows. A nation-wide campaign on the part of the dairy farmers would be a most welcome thing, if it had for its purpose, first, last, and all the time, the elimination of every unprofitable cow and the substitution in her place of one that would put a living profit into the pocket of her owner. That movement is surely coming. It cannot come too soon for the welfare of the world.

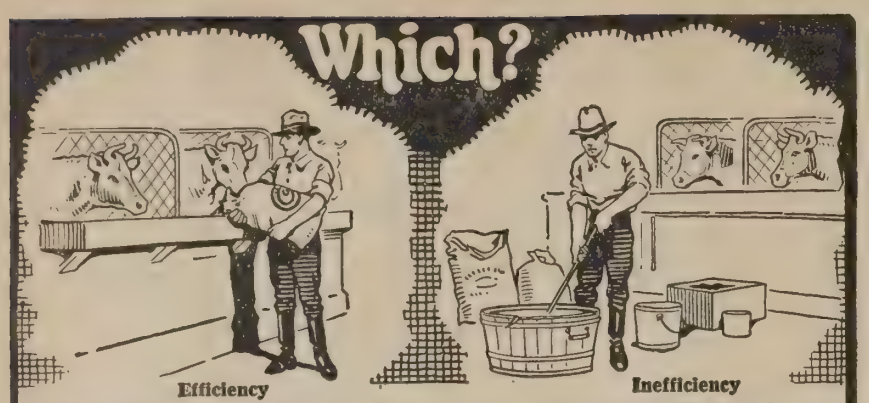
New York. E. L. VINCENT.

Tractors Relieve British Food Shortage

Changes in agriculture due to war are especially striking in the United Kingdom, where tractors have made possible increased crops in the face of a labor shortage. Since the beginning of the food campaign in November, 1915, when it became evident that the war would be long, Great Britain has imported more than 8,000 American tractors, and has orders outstanding for about 5,500 more.

Due largely to the operation of these machines, the combined acreage of wheat, barley, oats, rye, corn, and potatoes in England and Wales is about 33 per cent greater this year than in 1916. According to the American Consul General in London in a statement received by the U. S. Food Administration, the use of tractors in plowing has completely revolutionized farming methods. It is pointed out, however, that the large increase in cultivated land has been possible partly through plowing up pastures, and the cattle industry has consequently declined. This condition emphasizes the dependence of Great Britain on the United States for beef. —U. S. Food Administration.

Simple, Isn't It?



There is only one piece in the Sharples Tubular Bowl—no discs! Sharples Suction-feed Separator skims clean at any speed!

SHARPLES

West Chester, Pa., Chicago, San Francisco, Toronto

Sharples Milkers—used on half a million cows daily.

DO-61

Choose the Feed that's Right -and Ready to Use

There's no need to run risks by mixing your own dairy feed. You don't need to worry about shortage of some essential ingredient. You don't need to guess about the quality of each ingredient.

Here's the ideal balanced feed, ready for immediate use.

International Ready Ration

Saves Mixing Labor

The hours that you spend in mixing feed could be more profitably spent in other ways. International Ready Ration not only saves this time, but it saves money in its cost as compared with any other feed approaching its value. It's always uniform.

Better Than Mixed Feeds

International Ready Ration has a 20% protein content. This is the right percentage for the average milk cow—proved by innumerable tests. It has the right percentage of carbohydrates and fat. Naturally it produces the maximum milk flow—an increase is *guaranteed.*

The ordinary home mixed feed, though it may contain 20% protein, cannot equal Ready Ration in results. Accept the profits of this scientific feed—the result of years of experiment and experience. Write us if your dealer does not have International Ready Ration in stock.

INTERNATIONAL SUGAR FEED CO.
Minneapolis, Minn. Mills at Minneapolis and Memphis
Makers of International Special Dairy Feed—also guaranteed. Can be mixed with home grown grains or fed alone, as a 16% protein ration.

Remember the Name→

WE FED YOUR COWS

TRADE UNICORN MARK

¶ Almost every high American record for fourteen years with any breed was made with our Ajax Flakes as an important base of the grain ration.

¶ Unicorn Dairy Ration is the only feed that contains Ajax Flakes.

¶ You can hardly find a pure blood whose maternal ancestors were not fed on Ajax Flakes or Unicorn Dairy Ration.

¶ Unicorn is recognized as a safe, efficient and economical dairy feed.

¶ Unicorn during the past year made more high records than any other brand of feed.

¶ Unicorn really costs less per pound of milk or fat produced than other feeds.

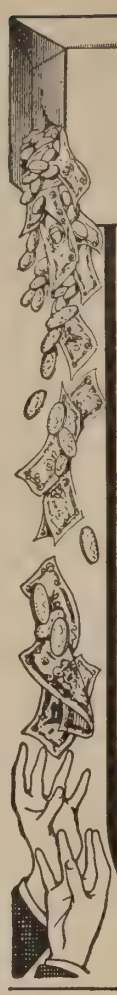
Future of the Dairy Industry

(Continued from first page)

tinental dairy countries imported than 2600 per cent, and of condensed milk 1600 per cent.

Nor will this demand for our dairy products abruptly cease with the coming of peace. When war ends foreign nations can buy grain for seed purposes and after the first crop be able to care for themselves as regards grain. The foreign demand for American grain will slump a year or two after the war ends with a corresponding slump in prices. "Not so with dairying," says the Department of Agriculture, "It takes a long time to develop dairy herds and a still longer time to so increase the number of dairy herds as to supply the world's needs."

A few months ago I heard Carl Vrooman say this: "The dairy herds of the old world are depleted to an appalling degree. There is not a country in Europe where the people have enough dairy products, and this process of depletion is going on every day, and every week, and every month, and will continue to go on as long as this horrible war lasts. When this was is finished, we will find the world with a demand for dairy products twofold, four fold, ten fold greater than the supply. Europe will come to us with outstretched hands, every country in Europe, and say to us, "We must have milk; give us canned milk; give us dry milk; give us butter; give us cheese; give us dairy cattle; give us animals to build up our dairy herds again. And unless America has stimulated the production of dairy products, has increased our supply of dairy animals far beyond anything in the past, we will be utterly unable to supply this demand."



It is true there have been some, well informed, who did not agree with Mr. Vrooman. Mr. Helmer Rabild, of the Bureau of Animal Industry, is one of those who believe that, "as a general proposition the decrease in dairy stock throughout the world has been largely through the disposal of the less profitable animals and the best breeding stock has usually been retained. For this reason we do not anticipate that there is likely to be a heavy demand on the United States from the older countries for breeding stock." Here are the opposing views. The truth is probably somewhere between.

Obstacles to Prosperity

But, in spite of the solid foundation on which the dairy industry rests, in spite of the hopeful outlook for the more distant future years and the optimistic view we can take of the immediate future, the dairy industry is today face to face with a most discouraging situation.

There are two great obstacles at the present moment which stand in the way of the prosperity of the men who own cows. Forty-four per cent of the milk produced in the United States goes into the making of butter; 41 per cent is used on the farms for drink and sold as market milk; 85 per cent of the entire milk production being marketed either in the form of butter or as milk for household use. In the market milks what do we find? Consumers warring against milk producers, newspapers damning dairymen, the Federal Government and the states indicting producers for alleged violations of anti-trust laws, consumers curtailing purchases of milk with every half-cent advance in price, though other products may advance by leaps and bounds without protest and without proportionate decrease in purchases.

What about butter? Ask your grocer. If you find what I found you will find that today the average grocer is

selling 60 pounds of substitute for every 40 pounds of butter—that an average of the past twelve months will show sales of more butter substitutes than of butter. And why is this? Price? Yes, in part. But you business men know that a product having the merits of butter can be sold at satisfactory prices and in satisfactory volume in competition with inferior substitutes even though the price difference be very great. The makers of butter substitutes are getting the business pretty largely because they are better salesmen.

Remedy

I have often wondered if those men who have been doing such splendid work for our industry in the fighting of oleomargarine might not perhaps have rendered even a greater service had they transferred the trial of their case to another court instead of fighting their case in the halls of Congress; they might better perhaps have pled their case before the bar of public opinion. Public opinion is the court of last resort—from it there can be no appeal.

The makers of substitutes shrewdly have been pleading their case before this court, and the dairy industry has had no advocate to represent it there.

In closing, this is the thought I would leave with you:

That in spite of the fact that the dairy industry is built upon a most solid foundation, and in spite of the fact, if we ignore the present situation, that the future outlook justifies the greatest of optimism, we are face to face, today, with obstacles that must be overcome if the dairy farmers of America are to cash in on the opportunity for great profit and great progress which is before them.

The consumers of milk who have been stirred to anger and who now are in fighting mood against milk producers because of ignorance of the value of dairy products and ignorance of conditions in the dairy industry, must be sold on the merits of milk. And the butter industry must be helped to full recovery and in future protected against inroads such as are being made today by the better merchandising methods of the substitutes.

These two greatest obstacles are to be overcome not by legislation but only by real salesmanship; and, in a business such as this, real salesmanship must take the form very largely of publicity and advertising.

Gentlemen, the solution of the problem is up to us. The obstacles are great but they can be overcome. Certainly in the dairy industry of America there is enough real business ability, enough real executive ability, enough real salesmanship to teach America the truth about milk and butter—enough real ability to beat the substitutors at their own game. But a hundred thousand dollars a year will not do it, neither will brief two weeks' or two months' newspaper campaigns in cities here and there accomplish the purpose. Nor is it a one man job. It is a task that calls for money and brains and work and cooperation of every individual in an entire industry.

Next to winning the war, the solution of this difficult situation, the determination of how to apply salesmanship to the marketing of the nation's dairy products, is the immediate and the vital job that is up to you—that is up to me—that is up to every man in the United States who is in any way interested in the prosperity of American dairy farmers.—From an address before the Des Moines Dairy Conference.

Guarantee the soldiers' sugar ration by sticking to your own.

Use—
Barrett Everlastic Roofings

—all over the farm

The Barrett Everlastic System of Roofings makes it possible for you to have at a low price just the kind of roof you need on any steep-roofed building.

There is a style for every purpose, including artistic red or green slate-surfaced shingles, or the same roofing in rolls as well as the highest grade of "rubber" roofing.

The Everlastic System of Roofings means *real economy in roofing* for the home and farm. Read brief descriptions of four styles Below.

Everlastic "Rubber" Roofing

A recognized standard among so-called "rubber" roofings. Famous for its durability. Made of the best waterproofing materials, it defies wind and weather and insures dry, comfortable buildings under all weather conditions.

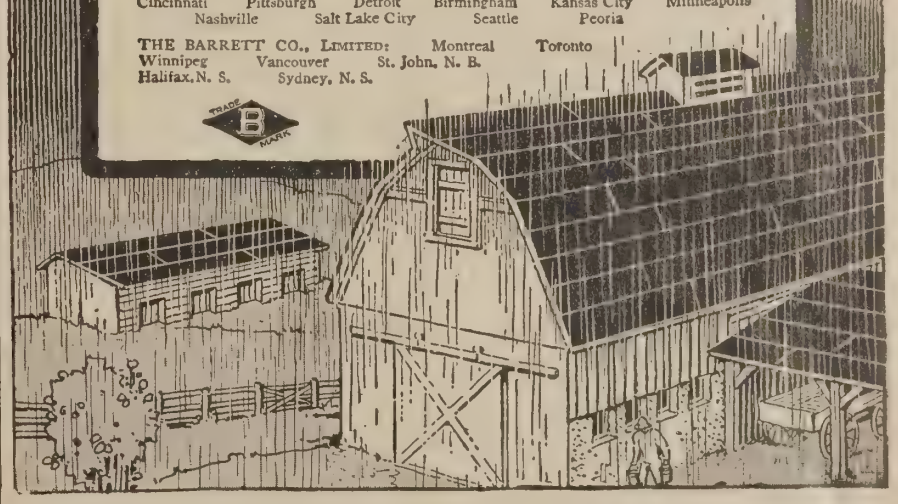
Everlastic Slate-Surfaced Roofing

A high-grade roll roofing, *surfaced with genuine crushed slate* in two natural shades, red or green. Never needs painting. Colors are permanent. Handsome enough for a home, economical enough for a barn or garage. Combines real protection against fire with unusual beauty.

Everlastic Multi-Shingles

Made of high-grade felt, thoroughly waterproofed and *surfaced with crushed slate* in natural colors, either red or green. Laid in strips of *four shingles in one* at far less cost in labor and time than for wooden shingles. Gives you a roof of unusual artistic beauty that resists fire and weather.

Everlastic Tylike Shingles



Made of the same durable slate-surfaced (red or green) material as Everlastic Multi-Shingles but cut into individual shingles, 8 x 12¾ inches. Laid like wooden shingles but cost less.

Write for Free Booklet. For further details write nearest office for free illustrated booklet covering all of these types of roofing.

Kankakee Interstate Fair, Kankakee, Illinois, August 26 to 31. Secretary, Len Small.

Ohio State Fair, Columbus, Ohio, August 26 to 31. Secretary, E. V. Walborn.

There are many farmers who find it pays them well to make butter and sell it in the city or village. The state college of agriculture at Ithaca, New York, will send you a copy of "Farm Butter Making". Ask for R. C. F. 60.

New York Butter Market

New York City, July 24:—With the coming of extremely hot weather the demand for butter has materially lessened. For several days the market has been decidedly weak and indications point toward a marked decline in price soon. Yesterday witnessed a decline of one-fourth cent in prices of upper grades of butter, the first change in quotations that had taken place for over a week. Local consumption is undoubtedly affected by the exit of large numbers of city dwellers to the country, they wishing to avoid the discomforts of the present hot wave.

Hot weather is beginning to show its effect on the quality of butter that is being received. While more noticeable effects will undoubtedly be apparent next week, many marks of butter which ordinarily grade as "Extras" have had to pass as "Firsts" this week. Now is the season of the year when milk and cream must be held cool, and when cream separators must be thoroughly cleaned twice each day. No matter how efficient or capable the buttermaker may be he can no more make wholesome, high quality butter from poor milk or cream than can the housewife prepare a palatable roast from a partially decomposed cut of meat. Absolute co-operation on the part of the creamery patron is necessary in order that the creamery may manufacture butter that will bring top price.

Until yesterday quotations had not changed since the report of last week. The changes of yesterday were peculiar in that while the upper grades showed a decline in price, the under grades closed fairly strong. The latest quotations are as follows: Extras (92 score butter), 45c; higher scoring than extras (93 score butter or above), 45½@46c; firsts (88 to 91 score butter), 43½@44¾c; and seconds (83 to 87 score butter), 41½@43c.

New York. W. B. LIVERANCE.

Representatives of Wisconsin Dairy Industry to Hold Meeting

At the request of the dairy interests of the state, the Wisconsin State Council of Defense has authorized calling a meeting of representatives of the various dairy and agricultural associations of Wisconsin and such other associations as are interested in the development of the dairy industry, the purpose being to organize a Wisconsin State Dairy Council. The place selected for the meeting is Milwaukee, in the "Gold Room" of the Hotel Wisconsin. The time is Wednesday, August 7th, at 8 a. m. On the evening of August 6th, 8:30 p. m., there will be an informal public meeting at the Hotel Wisconsin of all persons then present, to discuss plans for expediting the business of the following day.

Many who are engaged in dairying have appreciated for some time the necessity of informing the consumer regarding the food value and importance of milk and its products. In some sections of our state there is a surplus of market milk and, at times, butter, cheese, and condensed milk have had dull markets. It seems possible to those who have considered carefully the dairy condition of our state that the consumption of dairy products could be increased and a larger and better market secured. In these critical times it is both fitting and wise to assist our dairy industry in every possible way. It is invaluable to the welfare of the nation. The duties of the proposed Wisconsin State Dairy Council would be to lay plans and provide money for carrying on a systematic educational and advertising campaign regarding the food value and necessity of milk and its products.

Kildee Returns to Iowa

Professor H. H. Kildee, for the past two years head of the Division of Dairy Husbandry of the University of Minnesota, has resigned from that position to become head of the Animal Husbandry Department of the Iowa State College. Previous to his work in Minnesota, Professor Kildee held the professorship of Dairy Husbandry at the Iowa State College.

Professor Kildee has given splendid service to dairying in the two great dairy states in which he has directed the dairy husbandry instructional and experimental work at the agricultural colleges. If his new duties preclude his giving considerable attention to dairy cattle, the dairy industry suffers a distinct loss in his taking up general animal husbandry work. This is a time when dairying needs its able supporters.

Waushara Guernsey Picnic

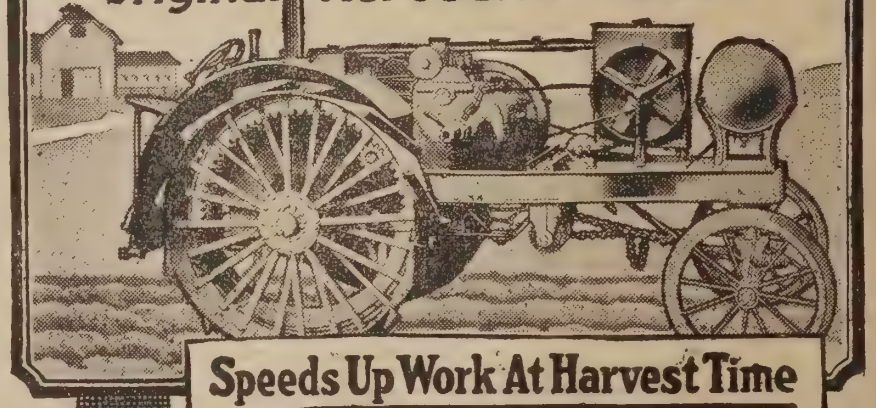
Guernsey breeders of Waushara County, Wisconsin, met recently in annual picnic at the Crowell farm. More than 1,500 persons were present. A judging contest for boys in which 21 entered was an early, interesting part of the day's program. Leon Gruber won first honors; Loren Eastling, second; and George Traxel, third.

Wm. McKerrow spoke of the value of having pure-bred sires and of keeping records. Other speakers were Mr. Ullsberger of the Hancock Experimental Farm, and J. W. Brann.

Moving a Silo

HOARD'S DAIRYMAN:—In a late issue, I notice an Illinois subscriber wants to move a silo. I will tell you my experience. We first tightened the hoops then raised the silo with a jack screw and loaded it on two eight-by-eights. These were fastened solidly by nailing two planks inside and outside. The outside planks were notched out some to fit the circle of the silo and inside plank. The corners were chopped to fit against the silo. It was then loaded for moving. We placed plank on the ground to move on and moved with rollers. Pulling was done with a tackle block. When ready to place on wall the silo was let down two inches at a time by using a bar for a lever. The staves were not moved out of line in moving.

Wisconsin. Max Wheeler.



Index Ready

The index for volume 55 of Hoard's Dairyman is ready for distribution. Those desiring this index may secure it for the asking. Address a postal to Hoard's Dairyman, Ft. Atkinson, Wis., and state: "Send me index for volume 55." Sign your name and address plainly. There is no charge for the index.

The government has requested that all publications be saving of paper. This is the reason why we are not mailing the index to each one of our subscribers as has been the custom. We shall, however, send the index to every one desiring it.

The cost of the U. S. Food Administration for its first year's work was less than two cents for every person in the United States.

WATERLOO BOY
Original Kerosene Tractor

Speeds Up Work At Harvest Time

You need to do some fast work when your standing crops are ready to cut; and you can rely upon the Waterloo Boy one man, three-plow, cheap fuel tractor to make every minute count.

One man can harvest 25 acres per day with the Waterloo Boy and an 8-foot grain binder, or 10 acres per day with a corn binder—has a threshing record of 16 loads clover in 4½ hours.

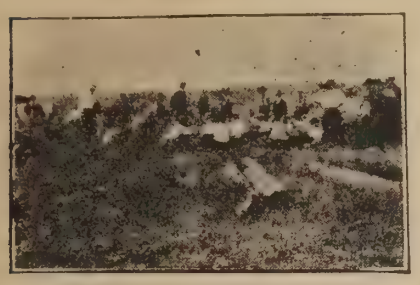
Waterloo Boy at Work

John Schoepf & Sons, Seward, Nebraska, write: "We plowed 42 acres with 60 gallons kerosene in 5 days; we shelled 18 loads corn in 2½ hours; we threshed 16 loads clover and alfalfa in 4½ hours with a No. 6 huller, the largest in this section. We think the Waterloo Boy as powerful and as cheap to operate as any tractor."

Stands Severe Endurance Test

The Waterloo Boy motor has pulled a 25-H. P. load for 312 hours without stopping. A test run of eight months showed average kerosene consumption of less than 1½ gallons per hour.

As efficient in the field as at the belt—pulls three 14" bottoms in heavy soil, with ample reserve power. Light weight, large, wide wheels, with powerful quick-starting motor and easy control enable the Waterloo Boy to do good work "where heavier tractors would not dream of working," writes one owner.



Remember, the Waterloo Boy is made and backed by a responsible manufacturer, and has over four years' proven success to its credit.

Illustrated Catalog sent free, shows why thousands of farmers are buying the Waterloo Boy. Write for it.

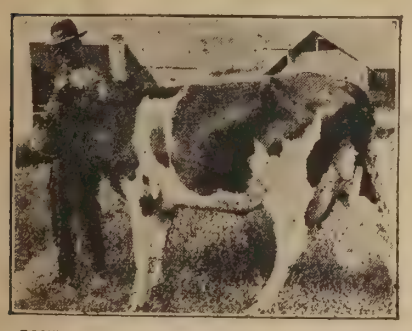
Dairy Show in Sanders Co., Montana

The dairy show which was held at Alger, Montana, June 22, was a big success. There were over 500 people in attendance during the day. More than $100 was given in prizes to owners of dairy cattle exhibited at the show. There were thirty-one head of dairy stock exhibited. Fifteen boys and girls entered the stock-judging contest. There were three prizes given in this contest; Arnold Kruger of Plains won first; Edwin Fairchild of Trout Creek, second; and Ernest Brown of White Pine, third. The show was held under the auspices of the Sanders County Farm Bureau co-



FARMERS OF SANDERS CO., MONTANA, AT THE DAIRY SHOW RECENTLY HELD WHEN THE FIRST BULL ASSOCIATION IN THE STATE WAS ORGANIZED.

operating with County Agent Hillman and W. E. Tomson, field agent in dairying.

Immediately after the picnic dinner, Mr. E. A. Duddy of the State College gave a fine patriotic talk. He was followed by Mr. F. W. Kehrli of Salt Lake City, who told about the value of a bull association. Cards were handed out after this talk and the dairymen were asked to indicate on them the number of cows in their herd and the choice of breed. Most of them favored the Holstein breed.

The dairy show was held mainly to stir up interest for the organization of a bull association and it greatly assisted in this. This organization of the Sanders County Pioneer Bull Association, which is the first organization of its kind in the state, was completed during the first three days of the following week. The association

ONE OF THE 31 HEAD OF DAIRY CATTLE EXHIBITED AT A DAIRY SHOW IN SANDERS CO., MONT.

A three-block Holstein Bull Association was formed. Prizes totaling $100 were given to exhibitors and three prizes were awarded in a boys' and girls' judging contest in which 18 competed.

is composed of three "blocks" and a pure-bred Holstein bull will be placed in each for use by the members of that block. At the end of two years the bulls will be moved on to the next block and then again at the end of the next two years, so that no new bulls need be bought for six years. Additional blocks may be added at any time and in that case no other bulls need be purchased for a long time. Another block will be added to the Sanders County Pioneer Bull Association next spring, and possibly two.

The main advantage of being a member of a bull association is that it enables a man with only a few cows to have the use of a pure-bred bull of good breeding for several years at only a small expense. So the man who has only a few cows has the use of as well bred a bull as the man who has a large herd.

Montana. F. M. HILLMAN.

Hints to Buttermakers

The following suggestions to butter shippers are made in the July 20 Weekly News Letter of the Gleaner Clearing House Association, under the heading "Some Hints":

Mottled Butter

Of late the butter of several of our shippers has been more or less wavy or mottled. As that condition usually results in the butter being placed among under-grades, we wish again to call your attention to it. A wavy or mottled condition is due to uneven distribution of salt in the butter. While there are several factors which are ordinarily listed as causes of mottles they are causes because they influence the distribution of salt. The one remedy for mottles is to work the butter sufficiently, as through proper working salt is evenly distributed throughout the butter. Butter which has a firm body can stand considerably more working than is ordinarily given it, without harm. Examine your butter with a trier 24 hours after it has been put in the cooler. If it is uneven in color, experiment with several churnings until you feel sure you have determined as accurately as possible the amount of working that should be given your butter.

The Butter Trier

Many creameries do not possess a butter trier, hence it is practically impossible for the buttermaker to examine his butter carefully after it has hardened in the cooler. A surface examination is not satisfactory. Only through boring the butter can its real condition be seen. The butter trier is a small investment—probably you can inveigle your supply house into giving you one—but it is a tool that may be instrumental in saving your plant considerable money in case it is used to advantage.

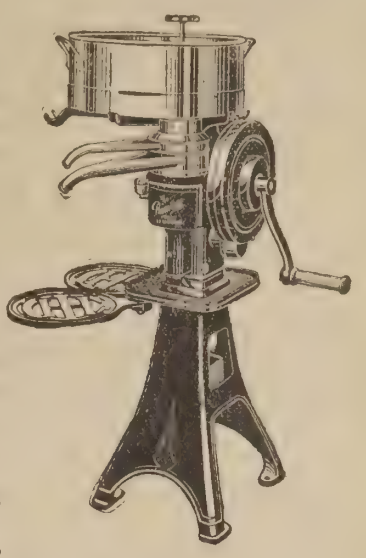
Marking Net Weights

Mark your net weights on the sides of your tubs. If they are marked on the covers they oftentimes become worn off or badly blurred by the tubs being placed on top of each other. Also there is greater accuracy in recording the weights as you make them, if the weights are on the sides of the tubs. That is especially true when they are piled up about four high.

Twine for an Acre of Grain

The state federal crop and statistical service of Missouri has been making an investigation in each county to establish the actual amount of binding twine used per acre, and the acre cost of twine, as well as the total cost and amount of twine used, and the finding is, per acre of wheat, 2.11 lbs., and for oats 2.19 lbs.

The average amount of twine per acre for a term of years is 1.88 lbs. for wheat, and 2.20 lbs. for oats.



The 1919 cost of twine per acre at 24 cents per pound is 51 cents for wheat and 53 cents for oats. To tie the entire 1918 wheat crop of Missouri on this basis cost $1,458,041, and for the 1918 oats crop the twine bill is $784,400.

The Missouri state penitentiary has factory capacity to manufacture all of the twine for Missouri farmers and dealers for 1919, in spite of the war labor shortage.

Upon the door I saw a sign;
I cried, "A motto, and 'tis mine!"
A wiser thing I never saw—
No Median of Persian law
Should be more rigidly enforced
Than this, from verbiage divorced;
"Push—don't knock."—Ex.

Stop the Cream Loss!

IF YOU are still setting your milk and skimming by hand, you are losing anywhere from one-fourth to one-third of your cream. If you are using a separator, and it is not one of the best, you are still losing an amount of cream that would surprise you if you knew it. Every farm loss or leak that can be stopped this year should be stopped. Buy a **Lily** or **Primrose** cream separator and stop the cream loss.

Don't imagine that cream left in the skim milk will fatten pigs and calves faster. It has been proved scores of times that stock thrives as fast on warm separator skim milk, when a little meal or flax replaces the fat. Cream in the skim milk is dead-loss cream!

Lily and **Primrose** separators get that cream. We can prove to you that they get it all, except about one drop in each gallon.

Besides that, they are well-known as simple, easy-running, easily-cleaned machines, that last and do the same good work year after year. Buy a **Lily** or **Primrose**—it will pay back its cost in cream you may now be losing. See the local dealers who handle these separators, or, write us for catalogues.

Burrell (B-L-K) Milker

equipped with

Automatic Controller

The Automatic Controller makes the Burrell a distinctly superior machine. It insures natural and thorough milking by regulating automatically and providing just the right amount of suction at all times. No other milker is equipped with this important device, and no human control can give the intimate touch required to adjust a machine to the needs of each individual cow.

Write for our pamphlets describing the Automatic Controller and other exclusive features which make the Burrell the most efficient and most profitable machine on the market.

SWALES
PATENT
MOUTH GAG
FOR
Horses, Cattle, Sheep, Dogs and Hogs

weighs under 10 oz. and is the most perfect instrument for the examination and treatment of the Mouth and Teeth, Physicking and Balling. It is applied without assistance or twitching as easily as a bit, neither frightening the most nervous, nor hurting the most sensitive animal. It acts like a charm on biting stallions, and the quieting effect of its use on nervous animals, when being shod, blistered, fired, clipped or trimmed, is simply marvelous.

The American Society for the Prevention of Cruelty to Animals, Headquarters, Madison Ave. and 26th St.
New York, June 18, 1918.
Swales Specialty Co., Inc.
Gentlemen: I have used your patent mouth gag for horses and believe it is a very good instrument for oral examinations and also to take the place of a nose "twitch". From a humane standpoint it is a great improvement and a necessary aid to the veterinarian and layman as well. Very respectfully,
DR. G. W. LITTLE, Chief Surgeon.

W. E. LITT, M. R. C. V. S.
Inspector of the Board of Agriculture.
Chief Veterinary Officer for the County of Salop and Borough of Shrewsbury.
Dear Sirs: I enclose cheque for Mouth Gag. I tried it yesterday at Hardwicke Grange, where Prof. M'Queen sent me, and I was very pleased with its simplicity and efficacy.
Yours faithfully, W. E. LITT.

No. 1. Suitable for horses or cattle, $3.00. No. 2. Large dogs, sheep or hogs, $1.50. No. 3. Small dogs, $1.25.
SPECIAL OFFER: Complete set of 3 instruments, $5.00. Postage free.

EDITORIAL COMMENT

For practical use, as one man put it, "There are just two kinds of cows, cows that make more than they eat and cows that eat more than they make." Which kind do you keep?

SOMETHING TO REMEMBER

We ought always to remember that if we raise a big crop of any kind it is done with an increased exhaustion of soil fertility. If we expect that field to keep up and do well in the future we must give it additional fertilizer. A good many farmers seem to forget this and book up a good crop as so much good luck, the product of the season, so to speak, and not of the land. Heavy crops must be met with an increased outlay for fertilizer.

NEW ZEALAND DAIRY PROGRESS

We see it stated by what appears to be creditable authority that the milk cows of New Zealand, because of improved breeding, produced an average of 19 pounds more butterfat in 1917 than in 1911, netting the farmers an increased revenue of $6,261,654.

The average dairy farmer in this country has made large advances in his judgment and appreciation of the value of more decided and intense dairy blood in the sire. There is a marked increase in the number of farmers who buy and keep pure-bred sires. That shows progress and if the figures were gathered they would show a great increase since 1911 in the number of profitable grade cows, as well as in the amount of their product. All the farmers have to do is to hold steadily on this course so well begun.

GROW MORE BARLEY

As a rule, barley will produce more pounds per acre than oats. When produced it is worth nearly double as a milk or meat producer. It is also a safer, surer crop than oats. It rarely falls down so it can not be cut and bound by the reaper. It is greatly superior to any other grain as a nurse crop for clover or alfalfa. It will produce as much pork, acre for acre, as corn and can be grown at half the expense. A few farmers grow corn for ensilage and barley to fatten their hogs. In face of all these advantages it is strange that more farmers who have a good barley soil—a clay loam—do not pay more attention to the growing of this most valuable grain. To this point Farmers' Bulletin No. 965 of the Agricultural Department, Washington, D. C., says:

"As a matter of farm economy the barley acreage in the northern tier of states should be expanded at the expense of oats. That it is not more widely grown is due to two causes: Its value as a stock feed is not realized by the farmers east of Montana and the brewing industry has dominated the market to such an extent that buyers of feedstuff do not think of barley as a feed crop. Barley must be considered as a feed in order to appreciate its true farm value. Not alone pounds, but pounds of digestible nutrients should be considered."

OUR DUTY

Our government is of the people, by the people, and for the people, and those who do not take interest enough in learning of those who represent us in Congress and knowing also something regarding their beliefs and actions regarding public questions are not contributing their full share toward directing the destinies of our country.

One of our subscribers recently wrote us: "In a late issue you deplore the ignorance of farmers not knowing the names of their congressmen. I for one can not keep track of them and last year, when wanting to write to them, I inquired, but found no neighbor to tell me, so I called on three storekeepers and one town clerk and none of them could tell me. I had to ask the postmaster before I found out. Officers change so much it is hard to tell who is in power."

It is not ignorance alone that has kept men from interesting themselves in their own government; it is indifference and a willingness to let the few take care of the election of congressmen and others to carry on our government.

We must, however, change our attitude in these things. It is important to know those who represent us in Congress and what they stand for. No nation can live, move forward permanently, which has our form of government, unless a majority of its people take an active part in selecting its representatives, or at least inform themselves regarding the men in office that they may vote intelligently.

There are those who feel the government of this country is a thing separate and apart from the people, that it is some force outside the people, when in reality it is nothing more or less than of the people. This is a government of the people, and by the people, and for the people. Let us not forget that. This being so means that if we are to have a just government, an intelligent government, and a progressive government, we must all do something towards creating such a government because it is of us. We delegate our powers to representatives, to officers in various capacities, but we cannot delegate these powers intelligently and with an assurance that we are going to have intelligent service unless we are informed regarding the men who are candidates for these positions.

BANKS LEND MONEY

A farmer owning several hundred acres of good land and about $10,000 worth of personal property and free from debt wanted to borrow $500. He went to a friend of his in the city and made known to him his needs. The friend said to him: "Why don't you go to a bank and borrow it?" The farmer hesitated and said: "Do you suppose any bank would lend me that much?" "Sure," replied the friend, "any bank would be glad to lend you all the money you need."

The farmer went to the bank advised by the friend and found the president at the counter. "Could I borrow $500 from you?" the farmer inquired. "Yes," said the banker, "you can borrow $5,000, or more if you want it." "Well," said the farmer, "I do want a few thousands this fall." "Come in when you need it and we will be glad to lend it to you," was the inviting reply of the banker.

It is hard to understand how any farmer who has been so successful in his own business and has accumulated a comfortable fortune could be so ignorant regarding the function of banks. It is the duty of any bank to lend money to a reliable person with unquestionable assets. There are too many farmers who do not understand that banks are established to serve the people and that they are just as anxious to lend money as the grocer is to sell sugar. The farmer need not feel that the banker is extending him an accommodation by lending him money, for he is in business for profit and his profit is gained by charging interest on the money he lends. The grocer makes his profit by charging more for groceries than he pays for them.

Farmers should learn to make use of banks. When money is needed, go to them. If the amounts are small most banks will lend money on notes, provided, of course, those asking for loans have been prudent to always pay their debts promptly and have otherwise kept their credits good. For large loans the banks require security, but there is no objection to giving security, for it costs nothing. Because a banker holds a mortgage on a piece of property does not mean that he can take it away from its owner. A mortgage is given as an insurance that the borrower will pay the banker the money borrowed from him and the interest.

"A LAZY MAN'S TASK"

Editorially our esteemed contemporary, the Breeder's Gazette, remarks in a discussion of type and production in a late issue, "It is a lazy man's task to work exclusively to records in breeding". We read the statement just after receiving an account of a young dairy farmer's struggle from the time of the purchase of his first high priced bull to the successful completion of the record of his first "thousand-pound cow".

For days and months and years he has worked hard—frequently seventeen and eighteen hours a day. His earliest concern was the purchase of a sire whose pedigree gave assurance that he would sire high producing animals. After that his effort was directed to giving the offspring of this bull the care and management which would be most certain to guarantee their maximum production. Production was what he worked for; it paid the original and subsequent investment in stock; and for the costly feed put into every animal from birth to producing age.

Now he has a "thousand-pound cow". At 4 a. m., 10 a. m., 4 p. m., and 10 p. m. for 365 days he has milked this cow and others on test. "Three timers" and "twice-a-day" milkers also claimed his efforts. He has planted and harvested crops, cared for young stock, and managed a farm between the hours for milking. When his mind has not been concerned with thinking of managing his present herd to secure their maximum production, he has pondered over the problem of selecting a new sire which, bred to the daughters of his present bull, will still further increase the potentialities of the herd for the production of milk and butterfat. For a "lazy man" he has been decidedly active.

This is not a selected schedule. It is duplicated on many and many a dairy farm. With slight variation, it tells the story of every successful Register of Merit and Advanced Register record of production yet made. It represents the work done by hundreds of dairy farmers.

These men may be mistaken in giving too much attention to production and too little thought to the points of conformation. Production, however, is the stuff with which debts are paid and improvements in equipment made. These men may err in the path they tread but a man who follows in their footsteps for a year—yea, for twenty-four hours, must be persuaded that, for a certainty, theirs is not "a lazy man's task".

Comparison of the Three Tests for Tuberculosis

The dairymen in this locality are having quite a discussion about the relative merits of the two tests for tuberculosis. Will you be kind enough to give a report on the subject, telling particularly the comparative value of the two tests and to what extent each is recognized by the authorities?

Fort Smith, Ark. A. W. B.

The thermal or subcutaneous test is in most general favor and insofar as interstate shipments are concerned is, we believe, the only one that is officially accepted. In this test the tuberculin is injected beneath the skin and the reaction manifests itself by a gradual rise and then decrease in temperature, varying from one to three degrees or more.

The intradermal test has found favor with several veterinarians because of the greater ease of application but it is generally considered to require greater ability on the part of the operator in order to properly apply it and interpret the results. However, it is stated by those who have had experience that with greater attention to details a man may become fully as efficient in interpreting this test as in following the somewhat more definite instructions applicable to the subcutaneous test.

In the intradermal test tuberculin is injected into the deeper layers of the skin and not into the connective tissues beneath the skin as in the subcutaneous test. The reaction manifests itself by a swelling at the point of injection, varying in size from a hazel nut to an orange.

The ophthalmic test has found favor with a relatively few veterinarians and investigators but it has generally failed to give satisfactory results when used alone. A drop or two of tuberculin is placed upon the eyeball, the reaction manifesting itself by a watering of the eye, reddening of the mucous membrane, swelling of the lid and matterating of the eye. It will sometimes discover reacting animals not disclosed by the other tests but its accuracy as a single test is questioned and is generally used only in conjunction with one or both of the other tests mentioned.

The United States Bureau of Animal Industry has not given unqualified approval to the intradermal or ophthalmic tests, neither have they been accepted by the majority of veterinarians. Dr. DeVine of New York speaks for his majority when he says in his recent book on "Bovine Tuberculosis":

"Several rather extensive experiments have been conducted in this country recently to determine if possible the relative merits of the different tests used in detecting tuberculosis. The conclusions arrived at are, that while the subcutaneous test involves more labor and expense than either the ophthalmic or intradermal test, the percentage of accuracy is in its favor."

Many other authorities could be quoted in greater detail but this apparently represents their general conclusions. The intradermal test is of relative recent introduction and we are, therefore, quoting in somewhat further detail from investigators who have approved it. These men are located in the states of Missouri, Montana, and California, where this test has attained its greatest popularity and where it is in greatest use. Dr. D. F. Luckey of Missouri is an enthusiastic exponent of the intradermal test and in a recent publication discusses it in part as follows:

"We have used the intradermal test almost exclusively in our state work during the past six

years. We have made over 100,000 tests. As some of the herds tested by this method have gone through the test two or even three times, we have tested not quite 100,000 different cattle. All of the reacting animals have been condemned and sent to slaughter. In certain dairy districts, those which were passed for sound have undergone one, two, or even three re-tests. In short, the intradermal method has been put on severe trial. During these years, this test has been used principally on the permanent herds to remain in the state. At the same time, the temperature test has been applied in making inspections for interstate shipment. In the tests of some of our permanent herds, we have interchanged the tests, even combining the ophthalmic test with them. We have given all these tests a thorough trial under the same identical conditions. From the very beginning, the intradermal method has produced the most satisfactory results. Apparently, this method of testing cattle for tuberculosis has rapidly gained favor wherever it has been used."

In Montana Bulletin No. 105 entitled, "The Intradermal Test in Bovine Tuberculosis," Dr. Howard Welch says:

"The subcutaneous or thermal test, with its temperature curves, is the pioneer of the tuberculin test and has proved its worth, but the other tests—the ophthalmic or eye test and the intradermal or skin test—are gaining ground rapidly. It was after the reported successful operation of the intradermal test in Missouri that it was decided to try some experiments with it in Montana. The results have exceeded our expectations.

"Through requiring experience to correctly interpret results, the intradermal test equals the thermal in accuracy and in many particulars far excels it. It economizes time, labor, and materials. It renders the work easier for the veterinarian and makes less trouble for the dairyman. State inspectors can more than triple the number of cattle that can be tested by the thermal method. The intradermal test has also made possible the rapid testing of large range herds. When the various states officially adopt this method, a great advance will be made in the national fight against tuberculosis.

"We have also found instances where cattle react to the thermal test and not to the intradermal and vice versa. In testing large numbers of cattle no doubt many such individuals would be found. Both tests applied simultaneously to a herd should, in the great majority of cases, pick out all the tuberculous animals."

Very careful work has been done in California, and Dr. C. M. Haring states the following conservative conclusions in California Bulletin No. 243:

"Most of the state authorities agree that they cannot as yet officially accept either the intradermal or ophthalmic method. The consensus of opinion seems to be that these tests are fairly satisfactory when administered by careful and experienced operators, but that it is unsafe to accept such tests from veterinarians indiscriminately, until these methods have come into more general use and have been accepted by the United States Bureau of Animal Industry.

"Since the reaction to tuberculin when injected intradermally depends upon a swelling at the point of injection and not on a rise of temperature, it is to be preferred to the subcutaneous under all conditions that are liable to modify the tuberculin temperature curve, such as unusual surroundings, very hot weather, or fatigue from a long journey. It can be satisfactorily applied to young calves and wild range cattle and is especially useful in testing cattle during the hot season in the interior valleys of this state under conditions that render the subcutaneous method of testing unsatisfactory. It excels the subcutaneous method in economy of time, labor, and materials.

"From our observations in applying 4,926 intradermal tests, including retests, to 4,001 head of cattle, 1,614 of which reacted, the results being checked by 1,000 subcutaneous tests and 341 autopsies, we conclude that under average dairy conditions the intradermal equals the subcutaneous method in accuracy, provided a 5 per cent, or stronger, solution of alcoholic precipitated tuberculin is used and the test is performed by an experienced operator. We do not advocate the substitution of the intradermal for the subcutaneous method by a veterinarian until he has become skilled in its use by practice and observation. The practitioner can easily accomplish this in the routine of his work by applying the two tests simultaneously. Such a procedure cannot injure the accepted subcutaneous method in any way, although it may modify the local intradermal swelling to some extent.

"Since neither the intradermal, the subcutaneous, nor the ophthalmic method will detect every case of tuberculosis when applied independently, the maximum number of reactors can only be detected by applying the combined tests. This may be done by applying the intradermal and subcutaneous tests simultaneously or by administering the intradermal test alone and retesting all of the non-reactors after an interval of at least seven days. The ophthalmic test may also be advantageously combined with either or both of these tests. The ophthalmic test alone is unsuitable for use under the average California dairy conditions, except when only a few animals are to be tested and they can be kept confined under shelter. For official tuberculin testing where a high degree of efficiency is necessary a combination of the three tests would be desirable. The intradermal method is especially adapted to the testing of swine.

"The intradermal method has proven very satisfactory in the out-of-door tuberculin testing frequently necessary in this state, and for the non-official testing of large numbers of cattle is preferable to the subcutaneous method. It requires more experience to apply the test and interpret the intradermal reactions than is required in testing by the subcutaneous or ophthalmic methods."

Milk Decreases in Test

I sell my milk to an ice cream company. In April my test was 4.55, in May it dropped down to 4.45, and in June I had one test of 4.5 and two tests of 4.3. I haven't had any fresh cows. The cows have been on extra good pasture and I am feeding cottonseed meal and crushed corn.

Does the dairyman get a just test where they only make four tests a month? They take a small sample from each milking. Should the dairyman have a test on each milking instead?

Bristol, Tenn. R. H. S.

If the samples mentioned have been properly taken the test should be accurate and show the actual production of the herd. It is perhaps the only practicable method available as the making of daily tests of each milking represents a considerable expenditure of time and effort that is not fully warranted. In many cases milk buyers take samples one day each week and use the test on this one day's sample to represent the entire week's production. Taken week in and week out, this will give a fair average for the year. In cow testing work it is found that when a sample is taken once a month it will average up to be fairly accurate in representing the cow's test during the year. There are, of course, exceptions to this rule, but it has been found eminently satisfactory. We believe that, in the particular instance cited, so far as the producer is concerned, he is amply protected in case the milk samples are properly taken and the testing honestly and accurately done.

In a recent letter discussing the reduction in summer tests, Professor Eckles of the Missouri College of Agriculture says:

"The seasonal per cent of variation in fat is a much more important matter than is ordinarily understood, at least, in those parts of the country where the summers are warm. Some years ago I made a study of 242 lactation periods and these show clearly that the seasonal variation is a strong factor. For example, if a cow freshens in December, she will ordinarily test lower the next June, July, and August than she did when fresh. She gradually comes up again toward the end of the period. If she freshens in June, she gives the lower test in the beginning of her lactation period. The general tendency is for milk to test the highest in the beginning of the winter during December and January, and the lowest in June, July, and August. Now this is not necessarily the result of the feed, in fact, I do not think it has anything to do with it for the reason that certain experimental animals we have had on uniform rations throughout the year followed exactly the same curve. It is accompanied apparently with the heat. Of course, the results are not uniform with every animal, some show it more than others, but the difference is found with nearly all animals. We find that the men for whom we are doing official testing get lower tests during the summer than in the winter."

To satisfy ourselves concerning the deductions made by Professor Eckles, we took from Volume 31 of the Guernsey Herd Register the records for 20 cows, calving each month during the year. We did this in order to overcome insofar as is possible the factor of the extent of a lactation period. It gave us a total of 240 records. We confess we were somewhat surprised to note the general tendency for the greater number of lower tests to come in the summer months of June, July, and August. However, our data appeared to show that the test of the majority of the cows is more largely influenced by their lactation period and that this was not overcome by the influences of the seasonal variation, although the seasonal variation did have a certain effect. Despite the tendency of cows on Advanced Registry tests to freshen with a relatively high fat per cent, we found no less than 65% of the cows had their lowest test during the first two months after calving. However, we found the cows calving during the summer months showed a higher percentage than this, 95% of those calving the latter part of June having their lowest test in July and August.

In the particular instance cited by our inquirer, where the majority of his cows have freshened from February to June, we would expect the test to gradually decrease as the weather became warmer. However, we would scarcely expect to see this condition manifest itself until June, July, and August.

Florida Ration—Mangels—Rice Bran

Please advise if I could secure a balanced ration for milk production composed of home products used with corn ensilage. We have cottonseed meal, velvet bean meal, and peanut meal. If so, about what proportion to use, and how much? Can also get rice bran and shorts. Also, how would mangels or stock beets do, shredded and put in silo, or would they be better stored as potatoes?

Jacksonville, Fla. G. B.

If the corn silage is combined with a liberal supply of a legume hay it makes the basis for a very satisfactory dairy ration. Clover, alfalfa, soy bean, or cowpea hay are very well suited to the needs of the dairy cow. Velvet bean hay if cured at the proper time would also combine very well with the silage. Mangels in addition, to the heaviest milking cows, would make very good returns in milk production. Mangels have their highest value in rations where silage is not supplied, but, fed in addition to silage, they give very good results. In feeding for Advanced Registry tests mangels have an especially high value. In addition to feeding 25 or 30 pounds of silage per day for the average cow, 30 to 40 pounds of mangels will be eaten with relish. Mangels should be stored as potatoes and not put in silos.

The concentrates listed are rather too high in protein to make a satisfactory grain mixture unless a carbohydrate feed is supplied with them. Rice bran, when not adulterated too heavily with hulls, is a satisfactory feed for cows. It is made up of the outer layer of the rice kernels proper with rice germs and a small quantity of hulls. If fed in large quantities it injures the quality of the milk produced but if it is not heavily adulterated with hulls and is fed in limited quantities it will combine very profitably in a grain mixture. Rice hulls are valueless as a feed for cows, Moreover, they may even be highly injurious. It should be made certain, therefore, that hulls are not contained in large percentages in corn bran. When adulterated with hulls, the feed is called "commercial bran".

Cottonseed meal, velvet bean meal, and peanut meal all fill about the same place in the ration. We would, therefore, use the one of these which can be purchased at the lowest cost. If a high carbohydrate concentrate, such as corn or hominy, can be used with one of these feeds and with bran and shorts, in about the proportions of 200 lbs. of the high carbohydrate concentrate, 300 lbs. rice bran, 200 lbs. shorts, and 100 lbs. of one of the other three meals, a suitable mixture is had. This should be fed to heavy milking cows in addition to the roughage, supplying it at the rate of one pound for each 3 to 3½ pounds of high testing milk produced or at the rate of one pound for each 3½ to 4 pounds of low testing milk.

Seeding Millet for Silage

Could you inform me whether either soy beans or millet can be sown in the corn row to make up for a poor stand? Could it be sown as late as August 1st? As our silo will be the main source of our dairy feed this year, owing to the shortage of good clover or timothy, we must be sure of a full silo.

Watertown, Wis. B. T.

It is now too late to sow soy beans in corn and expect to secure a satisfactory crop. Also, the stock of soy bean seed was very short this spring and we doubt whether there is any now on the market. The soy beans may be sowed as late as July 1st but preference should be given to seeding the fore part of June or at corn planting time.

Millet will make good silage but we question the advisability of seeding it in the rows with the corn. We would prefer to make our seeding of some other field and then cut it for ensiling as it reaches the proper stage of growth. If seeded between now and the first of August, a fair crop could be expected if growing conditions are excellent. We would hesitate, however, to advise waiting until August first or later.

GOODRICH TESTED TIRES

Buy from Goodrich Dealers Located Everywhere

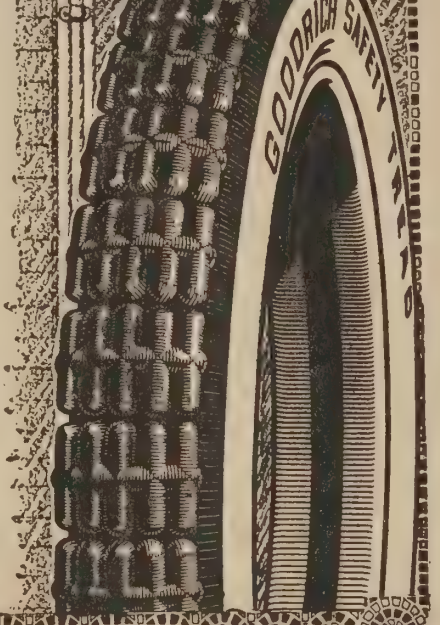
TIME was when a pneumatic tire meant luxury and pleasure to you men of the farm. To-day it spells quicker work, and more of it.

Hauling by automobile and motor truck make the tire a bigger and bigger item of expense in farming.

The hour has come for you farmers to reckon a real dollar-and-cent profit out of tires, just as from your ploughs and reapers, and count pleasure extra profit.

That is the Goodrich point of view, and Goodrich urges you to get profit by putting the speed, efficiency and economy of Goodrich Tires into harvesting your crops and hauling them to market.

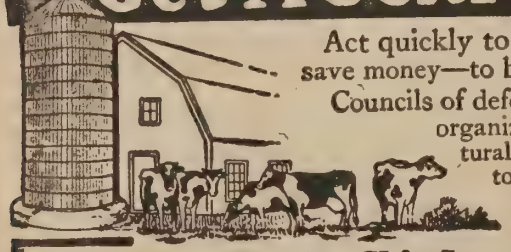
Nearly a half century of scientific and practical rubber making has built a maximum service in Goodrich tires for all road conditions.



Goodrich prestige and reputation for square dealing, the Goodrich name and brand guarantee their service, and farm experience has taught the value of a trustworthy name and brand.

Whatever tires you need for a small or large automobile, for your motor truck, motor cycle or bicycle, the Goodrich trademark is your guide to durability and dependability in tires.

A glance at the big, generous size of Goodrich Pneumatic Tires gives you confidence in them. Goodrich Truck Tires have outworn steel in actual work.



Cut the cost of tire expenses on your farm with SERVICE VALUE TIRES.

Get A Gehl Silo Now

Act quickly to save your corn crop—to save money—to back up your government. Councils of defense and other war winning organizations as well as agricultural authorities are urging farmers to build silos this year so as to increase and conserve food supplies.

We Can Ship Immediately

Special attention will be given to rush orders. We have the material in stock and can make prompt shipments.

Gehl Silos are made of the best ensilage-preserving wood in the world—clear, straight-grained Oregon Fir which is recognized as the best silo material, not only because it is very strong, lasting and durable, but because it keeps the air out and the moisture in, preserving the ensilage in perfect condition and retaining the appetizing flavor that makes the cows relish it.

Gehl Silo lumber is perfectly milled to standard silo pattern and is strictly clear and free from knots. One or two piece staves in any length up to 40 feet. As our contribution towards this silo campaign we will allow

A Special Discount on All Sizes

ordered during August and September. Write today for full information. State size of silo you want.
If interested in ensilage or alfalfa cutters ask for cutter catalog.

Maine Guernsey Breeders

The summer meeting of the Maine State Guernsey Association was held at Cold Brook Farm, Monmouth, Me., on June 25. The forenoon was spent inspecting Mr. Berry's fine herd of Guernseys of 21 head. The herd sire, College Heirloom 21171, is a good and well bred animal with lots of A. R. breeding back of him. His dam, grandam, and great grandam are all A. R. cows, with an average record of 424 lbs. fat. The cows are Maine bred and the records Maine made. He is the sire of the A. R. cow, Sylph's Primrose 60440, that made 7,604 lbs. milk containing 351 lbs. fat as a two-year-old.

After the picnic lunch, the good folks were called together and listened to words of cheer from the godfather of the association, Professor E. A. Bishop of the American Guernsey Cattle Club. He has charge of the A. R. work of the club and was able to tell of that line of the work. At present there are 1,200 cows under test by 250 breeders, but of the 150 breeders in Maine only three are doing A. R. work, with seven cows under test. Surely Maine breeders need to speed up and get busy or get left.

Ex-Governor Taines spoke a few words about raising lots of grain, cutting hay early, and not paying all of the cream check to the grain dealer. He also invited the association to meet with him at his farm in Waterville next year.

After giving a rising vote of thanks to the American Guernsey Cattle Club for sending Professor Bishop to us and to Mr. and Mrs. Berry for their entertainment, the meeting adjourned to the call of the president.

Maine. G. S. SMITH, Sec.

New Flour Milling Regulations

With the end of the milling year on July 1, the Food Administration reviews conditions which have prevailed in the flour milling industry and also announces new regulations to be put in effect.

Under the original regulations, the millers were allowed a maximum gross profit of 25 cents per barrel, based on their annual business. The business is recognized to be a seasonal one and cannot be judged on profits determined upon a few months' operations, or can annual profits always be accurately forecast at the beginning. Millers finding themselves at the end of the fiscal year with an amount in excess of 25 cents a barrel profit have been notified that they release themselves from the difficulty by selling a sufficient amount of flour at a nominal price to the Food Administration to liquidate any such surplus profit. Millers' accounts are audited by representatives of the Enforcement Division of the Food Administration.

Under the new plan of mill regulation now being organized, trade will be free but profits closely limited. Speculation will not be permitted but no limitations are placed upon the freedom of flour mills or traders to buy or sell in any market. The mills are, however, under restrictions to reflect the government price within the profit limitations upon flour. The whole plan has been approved by the Agricultural Advisory Committee, the board of 24 members which confers with the Food Administration on matters affecting producers.

New York Hay Crop Short

Unfavorable June weather reduced New York's prospective hay crop a million tons, according to federal reports. Early estimates placed the cutting at 5,750,000 tons. This is now reduced to 4,750,000 tons, one of the lightest crops of recent years.

Timothy is an especially poor crop, alfalfa and clover being in much better condition. Old meadows are thin and weedy. This makes the loss heavy in dairy districts where hay lands are reseeded less frequently than in other sections.

Oats, barley, and spring wheat have improved since June 1, as have rye and winter wheat, though these latter crops are reduced from winter-killing. Corn, planted on a greatly increased acreage, is retarded in growth by cool weather. The potato acreage is only about 85 per cent of that of 1917, but an exceptionally fine condition of the crop makes the estimate exceed the average production for years previous to the last by 3,000,000 bushels.

Switzerland Rations Milk

Although known the world over as a dairy country, Switzerland has under stress of present food conditions established milk rations. Beginning June 1, 1918, the daily allowance per person is one-half liter (about 4-5 pint) except that children under 15 years, adults over 60 years, and farmers' families may have double that amount per capita.

Minnesota "Twilight" Meetings

HOARD'S DAIRYMAN:—Steele County, Minnesota, Holstein breeders have conceived a new idea of keeping up their morale. Steele County is strictly a dairy county and in its twelve little townships there are over eighteen thousand cattle, most of them Holsteins. Hence the labor question is a serious one in this locality since experienced dairy help is very hard to obtain and hold. In order that the breeders may not become discouraged and that they may keep on the job, in spite of handicaps, the idea has been conceived of holding a series of twilight meetings on the various Holstein farms in the county.

On the evening of July 8 the first meeting was held on the Alex Chambers Holstein farm. At this meeting the herd was inspected by the people present and then a short program was held on the lawn in front of the house.

At this time, Mr. E. T. Winship, president of the Minnesota State Holstein Breeders' Association, presented the facts that now is the time that the Holstein men should "Dig In" and "Carry On", as the time is now at hand, in spite of the shortage of help, to build up the herds and keep things going as near normal as possible.

Mr. Horton of the Photographic Division of the Minnesota Experimental Station made a very interesting talk on the value of photography in the advertising and selling of live stock. Mr. C. A. Searles, secretary of the Minnesota Holstein Association, spoke of the wonderful progress Steele County is making. He had just completed a trip over the state and was highly pleased with the number of fine well bred sires that are standing at the head of the various Steele County herds.

On the night of July 17, the second of this series of meetings was held on the L. S. Taylor Holstein farm. Three hundred people were present. Here again the fine Holsteins were admired by both the town and county people, after which a program was given.

Mr. F. H. Joesting, County Director of the Public Safety Commission, told the farmers present that the men of the city are ready to do everything they can to help harvest the crops. The county agent, W. V. Gousseff, told of the wonderful response from the men of the city to help harvest the crops. Over three hundred business men in the city are ready to go out at short notice and one hundred automobiles are ready to take them out to help save the crops for democracy.

The business men were told how their support of the various projects in the development of Steele County agriculture is bearing fruit. They were told how Steele County with its twenty-three co-operative creameries in twelve townships has less square miles of territory per creamery than any other county in the United States; how Steele County is one of the outstanding counties in the Northwest for Holstein cattle; and how it stands first in the Northwest for its good roads; all of this being brought about by the financial and moral support of the men in the city.

The idea of these meetings is not only to show off the good stock on the farms but to keep up the morale of the people by tieing the people of the town and country together and demonstrating that both are necessary links in the successful chain of co-operation.

Before these meetings are over everyone is anxious to know where and when the next one will be held. The people realize that by this means of meeting together they not only see Steele County Holsteins but they seem to forget their troubles for the time being; both country man and town man are made to realize that their troubles are no different from those of hundreds of others and that there is only one thing to do and that is to make the best of it. The fellowship created by the business men in town and the business men on the farm cannot help but do good for the upbuilding of the county.

Minnesota. W. V. GOUSSEFF.

Brattleboro Sale Cancelled

The announced August 6 and 7 sale of the Pure-bred Live Stock Sales Co., of Brattleboro, Vermont, will not be held. The auction is cancelled at the request of the consignors who state that they cannot take part in a sale on those dates because of the cold and rainy weather which has delayed haying, the backward condition of the corn crop, and the seriousness of the farm labor situation.

A model dairy farm will be one of the main features of the Mississippi State Fair at Jackson, October 22 to 26. Demonstrators will show each day of the fair the best methods of handling dairy products.

PROOF of Avery Tractor success is shown by the way Avery Tractor sales grow in the same community. When one farmer gets an Avery Tractor, his neighbors watch its work closely. It is not long before another Avery arrives and then another, for his neighbors see that Avery Tractors stand up under the work.

Likewise, when an Avery gets into a family, other members of the same family soon become Avery owners. Brothers, cousins, fathers and sons, uncles and nephews are buying Averys. We have many records of where two, three and four brothers in the same family have bought Avery Tractors. The fact that neighbors, friends and relatives buy Avery Tractors after they have watched carefully the work of the first Avery Tractor in their community or family, is the very best proof that Avery Tractors are a success.

Power for Every Farm Need

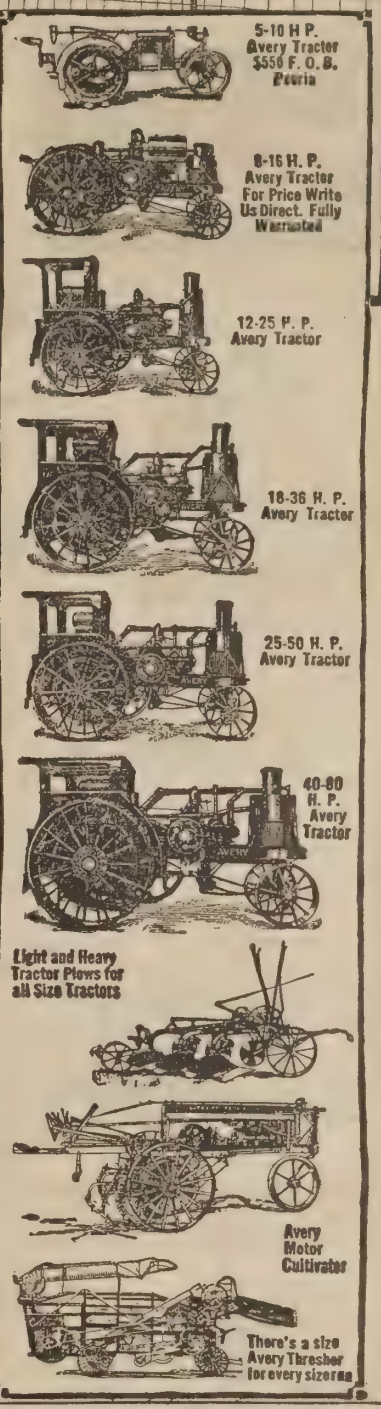
You can get an Avery Tractor to exactly fit your size farm. Avery Tractors are built in six sizes—a size for every size farm. With an Avery Motor Cultivator you can also cultivate your row crops with motor power. You can also get a size Avery "Grain-Saving" Separator and Avery Plow for any size Avery Tractor. For any kind of field work, belt work or road work, there is a successful and profitable Avery Motor Power Machine.

Built by Motor Farming Machinery Specialists

The five sizes of Avery Tractors, from 8-16 to 40-80 H.P., are all of the same design. They have low speed motors, renewable inner cylinder walls, adjustable crankshaft boxes, gasifiers that turn kerosene into gas and burn it all, and many other original and exclusive features.

Avery Tractors are built entirely in our own big factories and every part of an Avery Tractor is built especially for tractor work and only for the Avery Tractor. Avery Company are *builders*—not assemblers.

See the Nearest Avery Dealer



Go to your Avery Dealer and get the size tractor and equipment to meet the needs of your size farm. No matter how small or how large the acreage you cultivate, Avery motor farming machinery will fill your requirements. Or, write for complete catalog, showing the Avery Line in natural colors.

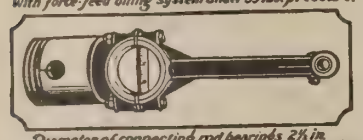
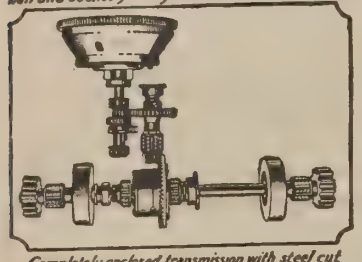
No Other Tractor Has So Many Good Mechanical Features=



Electric lighting system throws light both ahead of tractor and down'd implement.



Perfected overhead-valve Four Cylinder engine, with force-feed oiling system under 35 lbs. pressure.

Diameter of connecting rod bearings 2¾ in. compared to piston diameter of 3¾ in. insuring long life.

Valves placed in perfect adjustment by turning down ball and socket joint of rocker arm with screw-driver.

Completely enclosed transmission with steel cut gears, Hyatt bearings, differential lock, and brakes

MOLINE UNIVERSAL TRACTOR

It Solves The Farm Help Problem

EVERYONE who knows what a tractor should do, agrees that the Moline-Universal has three distinct advantages over all other tractors: lighter weight; greater economy and ease of operation; ability to do all farm work, including cultivating; and ONE-MAN control of both tractor and implement from the seat of the implement, where you have always sat, and where you must sit in order to do good work.

Aside from these distinct advantages which the two-wheel construction gives, the Moline-Universal Tractor, Model D, is still the best tractor on the market. In every detail it has been refined and perfected to the utmost limit of modern engineering knowledge.

Self Starter—Electric Lights

The Moline-Universal is the only tractor regularly equipped with a complete electrical starting, lighting, governing and ignition system. The starter saves many hours of productive work, besides eliminating back-breaking labor. Electric lights enable the tractor to be worked at night during rush seasons.

An electrical governor perfectly controls the engine speed. By simply turning a dial, within easy reach of the operator, engine manitains any speed from ½ to 3½ m. p. h., and automatically handles all changes in load.

Perfected Four-Cylinder Engine

The perfected four-cylinder engine is the latest development in overhead-valve construction. With a bore of only 3½ inches a 2½-inch crankshaft is used. The strength and thickness of the crankshaft eliminates all vibration. Oil is forced through hollow crankshaft to all the main and connecting rod bearings under a pressure of 35 pounds to the square inch. The bearings float on a film of oil, so their surfaces never touch.

Double valve springs give unusually quick action with soft seating. Rocket arms are swiveled on ball and socket joints that may be turned down with a screw driver, placing the valve mechanism in perfect adjustment at all times. This engine develops unusual power and is very economical in operation.

Steel Cut and Hardened Gears

The transmission is completely enclosed, with drop forged, hardened, and cut steel gears running in oil that reduce power loss to a minimum. All gears are mounted on heavy duty Hyatt roller bearings, with high grade ball bearings fitted with adjustable collars to take up end thrust. Fifteen Hyatt roller and five ball bearings are used in the Moline tractor. Seven splined shafts are used in locking gears to shafts. This is the strongest construction known, and has the additional advantage that it makes the transmission easy to take apart.

For pulling in soft ground, the two drive wheels can be made to revolve as one by means of a differential lock, doubling their pulling power.

Complete Enclosure of All Parts

The final drive is completely enclosed in dust tight shields, the edges of which are sealed by heavy grease used to lubricate the gears. Every part of the Moline-Universal tractor is protected against friction and wear.

All working parts are accessible. All the weight is so well balanced on two wheels that the rear end of the tractor can be supported with one hand.

The Moline-Universal Model D will give you longer and better service at less expense than any other tractor. It is built for positive reliability.

Our catalog describes the Moline-Universal in detail. Send for it. Address Department 18.

Stopping a Leak by Creosoting Lumber

(Continued from page 36)

Hemlock is less durable than the species commonly used for this purpose, and consequently a heavier impregnation with creosote oil is necessary. The lumber for this type of silo should be creosoted by the manufacturer by the Standard Open Tank Process, namely, immersion for from 30 minutes to one hour in alternate hot and cold baths of refined coal tar creosote oil. Should, however, lumber creosoted in this manner not be obtainable, then the farmer may of course erect his own treating tank, or a number of farmers can co-operate in the building of a treating tank which may be moved from one farm to another. It would probably be more convenient for the farmer, if he is to treat the lumber himself, to submerge it in the creosote, heat the oil to an average of 180°F., but not in excess of 200°F., and when this temperature has been reached withdraw the fire permitting the lumber and oil to cool to atmospheric temperature. If hemlock lumber can not be properly treated it is best to employ a more durable species.

Fence Posts

The most common evidence of decay on the farm is the rotting of fence posts, and their preservative treatment presents perhaps the greatest opportunity for saving. Many non-durable species of wood, such as cottonwood, poplar, willow, ash, sappine, etc., which are abundant in some localities but untreated are hardly worth the cost and trouble of setting, can be made to last from fifteen to twenty years by creosoting. The Iowa Agricultural College has made very extensive investigations and experiments which are reported in their bulletin 158, and which show that cottonwood posts, which untreated have a life of but from two to four years, after having been creosoted were in a perfect state of preservation after nine and one-half years service, indicating a probable life of twenty years. Cottonwood, and similar species of posts can be grown on the farm, peeled, and seasoned for about five cents each, then can be creosoted by the Open Tank System for from fifteen to twenty cents each, and will last about twice as long as a cedar post of four inches top diameter, untreated, which at present costs from twenty to thirty cents each depending upon the locality. Thus the economy of creosoting these non-durable woods is very great. Cedar, chestnut, and other more durable species should also be creosoted. Sometimes the Brush Method alone will suffice, but if possible the Open Tank treatment should be employed.

Creosoting fence posts by the Open Tank System is more simple, and does not require the elaborate equipment necessary for treatment of miscellaneous lumber by this process. Old steel oil drums or barrels, under which a fire place consisting of stones and a few pieces of pipe can be built to heat the preservative, will suffice for the hot tank, and ordinary tight wooden barrels will do for the cold tank. The posts, if of nondurable species, should be set in the hot tank and immersed to a point about one foot (at least six inches) above the future ground line, the creosote heated to 150 to 200 degrees Fahrenheit and maintained between those temperatures for about one or two hours when the posts are to be removed to the cold tank and immersed to a like depth for the same length of time. After this treatment of the butts has been completed it is advisable to also immerse the tops for from 15 to 20 minutes in the hot creosote. The purpose of the latter is to prolong the life of the tops to equal that of the butts. Cedar, chestnut, oak, and similar posts should be treated in the same manner excepting that the period of immersion in each bath should be prolonged to three or four hours, and the tops need not be dipped. It is, however, good practice to brush treat the tops of these latter kinds of posts after they have been set. Another method for creosoting the durable species is to immerse them in the hot tank, heat the oil to about 200 degrees Fahrenheit, and when that temperature has been reached quench the fire. Instead of being removed to the cold tank the posts remain in the creosote and are allowed to cool to atmospheric temperature. This arrangement requires but little labor as posts can be placed in the tank in the evening and when the proper temperature has been reached and fire withdrawn they can stand during the

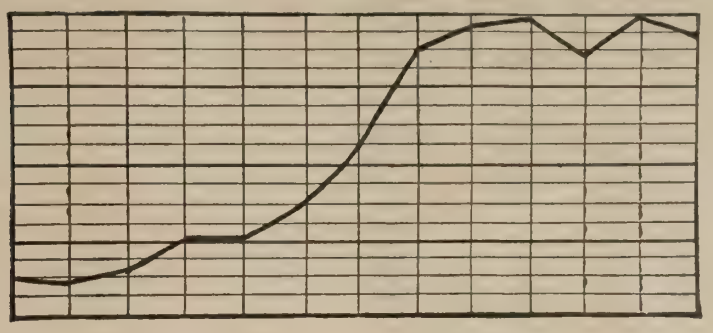
night without further attention. The operation can be repeated in the morning during the time that the farmer, or his help attends to the chores, and again that night and so on until all the posts have been creosoted.

If fence posts are to be brush treated the creosote should be applied to the entire butt from at least six inches above the future ground lines. This surface should be thoroughly cleaned of all inner bark and other foreign substances so that the preservative will penetrate into the sound wood.

The preparation of fence posts for creosoting is equally as important as the treatment itself. Posts should be peeled immediately after having been cut and seasoned until air-dry. Creosote oil cannot penetrate if the cells of the wood are full of moisture. This also applies to any wood which is to be treated. If the lumber or timbers cannot be seasoned, or if seasoned posts cannot be obtained, the Brush Method may be used, but will, of course, not be as satisfactory as if the material were air-dry.

Creosote Oil as a Paint

Refined creosote oil has become popular as a paint, especially under present conditions when oil paints are costly. Its color is a pleasing nut-brown and when combined with white painted window sashes, door frames, and trim the result is very attractive. It is not possible to cover a creosoted surface with paints of lighter hues, unless the former is first shellaced, which would be too expensive for ordinary purposes. Unless one is prejudiced there is no good reason why a farm building cannot be stained brown just as well as painted red, green, blue, or white, and as the cost of creosote is about one-third of the cost of good paint, and as its preservative qualities are naturally much greater, it will certainly pay to like a nice brown color.



Economy of Creosoting is Proven

The diligent practice of wood preservation on the farm is one item of economy which will very soon prove its worth, and in the course of a few years the saving will represent a very neat little sum. The actual reduction in the annual cost of creosoted structures, depending upon their character and purpose, has varied from a minimum of 10% to more than 50%. The creosoted butts of telephone poles which pass in front of most farms throughout the country represent a saving of 15% to 25%; the creosoted ties used on the railroad which the farmer must cross on his way to town will last nearly twice as long as the same ties untreated (excepting where destroyed by wear), and the creosoted blocks covering the bridge floor over the nearby river are the cheapest kind of pavement because of their long life. In every industry where wood is used in situations favorable to the development of decay creosoting by one of the three methods described herein is practiced, because rotted lumber means loss in time and money, increased cost of doing business, and consequently less profit. It will pay the farmer just as much to make the lumber and posts he uses as near "rotproof" as possible, as it does the railroad, the mine, the telephone company, etc. Profit depends upon cost of production, and the more economically an enterprise is managed the greater the gain.

Garget

Clots in milk are quite common. The condition is generally known as garget. Sometimes the milk is affected only slightly, and sometimes it is seriously affected. The cause is not definitely known, but it is due to an abnormal condition of the cow's udder. Sometimes the trouble will occur two or three days and then disappear. Occasionally it will occur at intervals through the whole milking period of the cow.

C. H. Eckles of the Missouri College of Agriculture suggests that the cow be given a physic of 1½ lbs. of Epsom salts in the form of a drench. A tablespoonful of saltpeter given once a day for three or four days is sometimes beneficial. If the animal has been receiving much grain, the ration should be reduced for a day or two. The amount of grain may then be restored after the condition disappears. If the trouble persists month after month and the cow is not especially valuable, it would be advisable to dispose of her, because it is not always possible to eliminate the trouble.

Why live stock prices go up and down

WHEN there is more dressed meat on the market than there is consumer demand for it, meat and live stock prices go down.

But when the consumer demand for meat is greater than the supply, meat and live stock prices go up.

This is the law of supply and demand. It is the law that determines the prices the producer gets for his cattle.

* * * *

Between the producer of live stock on one hand and the consumer of dressed meat on the other hand is the service of the packer.

The packer turns the live stock into dressed meat and by-products and then distributes them to the retailer.

Out of every dollar the packer receives for this meat and by-products he pays 90 cents, approximately, for the cattle.

The remaining 10 cents on the dollar must pay for dressing, freight to market, operation of distributing houses, and in most cases delivery to the retailer.

Out of what is left must come the packer's profit. For Swift & Company during 1917 this amounted to a net profit of ¼ of a cent per pound of beef. On *all* products, it was only a little over half a cent per pound.

A reasonable profit margin is necessary to enable the packer to operate without endangering the efficiency of the business and its value to the producer as a marketing agency for live stock. Complete elimination of these profits would have practically no effect on the farm prices of live stock nor the retail prices of meat.

Swift & Company will gladly co-operate in the carrying out of any national policy that will tend to steady the prices of live stock and meat.

Swift & Company, U. S. A.

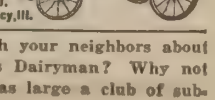
ALFALFA

AMERICAN NORTHERN GROWN

For fifteen years our advice concerning the seeding and care of Alfalfa meadows, and our seed for sowing them, have been standard—the best that was to be had. The catalog tells how, and prices the seed, not Turkestan, "Dwarf Alfalfa," which we refuse to handle, but the best of American grown seed, including usually Montana, Idaho and the great "Dakota 30," which rivals the Grimm itself.



GRIMM ALFALFA Next to Hansen's Siberian, the greatest variety grown in America. We have the genuine; also limited amounts of the Siberian.

Sample and prices on request.

Get Woodwork that Suits Your Plan

OUR books of home plans, with both exterior and interior views, show how well and tastefully you can finish any class or type of home with standard sizes and designs of

1866 CURTIS WOODWORK
"The Permanent Furniture for Your Home"

These books, "Better Built Homes," Vols. II and III, will help with your plans, too. Just let us know about how much you expect to put into a home and we will send you the right volume, free.

All CURTIS Woodwork, whether it be a big built-in sideboard or only a plain but useful window, bears our trade-mark CURTIS.

That mark is the connecting link between the pictures in the Curtis Catalog and the woodwork that goes into your home. It identifies Curtis design, material, workmanship. Look for it.

THE CURTIS COMPANIES, SERVICE BUREAU
1902-2002 S. Second Street Clinton, Iowa

The makers of CURTIS Woodwork guarantee complete satisfaction to its users. "We're not satisfied unless you are."

Sixty Wisconsin Herds are Accredited

Wisconsin has sixty accredited tuberculin tested herds according to the announcement of Commissioner of Agriculture C. P. Norgord and State Veterinarian O. H. Eliason of the Wisconsin Department of Agriculture, who have the work in charge. These herds have been tested under the supervision of the live stock sanitary division of the Wisconsin Department of Agriculture and the inspectors of the Federal Bureau of Animal Industry. They have all satisfied the requirements of this class of herds and have been issued state accredited certificates. It is becoming generally known and recognized that a single animal tuberculin tested from an untested herd is an unsafe animal. The only safe herds are those tested annually. The annual certified tests required of these accredited herds therefore make them the safest and cleanest herds within the state in respect to tuberculosis. The annual test on a number of additional herds is now due. These additional herds will be placed on the list as soon as they have completed the necessary tests.

Following is a list of accredited herds as issued by Commissioner C. P. Norgord and State Veterinarian O. H. Eliason:

F. M. Ames & Son, Green Co.
Jens Anderson, Clark Co.
S. A. Baird, Waukesha Co.
E. S. Bedell, Manitowoc Co.
C. P. Bunday, Eau Claire Co.
Stephen Bull, Racine Co.
Chas. Breitenbach, Outagamie Co.
Roy Burton, Waukesha Co.
Joe Cook, Racine Co.
J. F. Denham, Dunn Co.
H. H. Earle, Waukesha Co.
Anson Eldred, Oconto Co.
A. W. Fox, Waukesha Co.
Wm. E. Fisher, Milwaukee Co.
Torris Geraldson, Manitowoc Co.
Hamilton & Kaufman, Waukesha Co.
C. Hoppert, Sheboygan Co.
Hamilton & Stillman, Waukesha Co.
Chas. Hill, Fond du Lac Co.
W. D. Hoard, Jefferson Co.
A. R. Hoard, Jefferson Co.
H. Holt & Son, Waukesha Co.
E. C. Jacobs, Dunn Co.
W. C. Jamison, Outagamie Co.
E. E. Jones, LaCrosse Co.
Richard F. Klemm, Sauk Co.
Hiram Lovejoy, LaCrosse Co.
H. N. Longley, Waukesha Co.
Wm. Lawson, Fond du Lac Co.
Theo. Lehman, Jefferson Co.
Lone Tree Farm, Green Lake Co.
Geo. S. Love, Waukesha Co.
Henry Luttman, Jefferson Co.
M. Michels, Fon du Lac Co.
O. A. Marken, Manitowoc Co.
Thomas Madigan, Fond du Lac Co.
W. J. Mann, Waukesha Co.
Fred C. Marty, Green Co.
Geo. McKerrow, Waukesha Co.
Harold Morgan, Fond du Lac Co.
Flurance Noonan, Juneau Co.
A. A. Noyes, Jefferson Co.
Wm. Pfeffer, Waukesha Co.
Alvin Parish, Walworth Co.
Chas. W. Peterson, Lafayette Co.
H. E. Reddelien, Waukesha Co.
J. J. Reid & Son, Waukesha Co.
Carl Remington, Juneau Co.
Owen Rowlands, Waukesha Co.
Jos. Stapelton, Waukesha Co.
Roy Scribner, Fond du Lac Co.
Fred C. Smith, Waukesha Co.
Mrs. F. D. Stout, Barron Co.
L. B. Stevens, Waukesha Co.
H. C. Taylor, Dane Co.
Henry Volbrecht, Fond du Lac Co.
Theo. Werder, Ashland Co.
James N. Wishka, Kewaunee Co.
Otto Zickert, Fond du Lac Co.
Frank Swan, Milwaukee Co.
M. L. Welles, Fond du Lac Co.

The State Accredited Herd Project was established in 1916 by the State Department of Agriculture at the State Capitol for the purpose of assisting those herd owners who have been sufficiently progressive to have their herds tuberculin tested to reap the benefit in trade in cattle and dairy products which naturally result therefrom. The Department aims to do this by publishing a list of these herds, and in sending out a list of them to those interested in them, in this and other states at frequent and regular intervals. Arrangements have been made whereby animals from these herds can be shipped to any state in

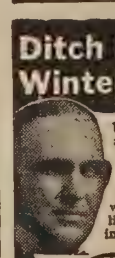
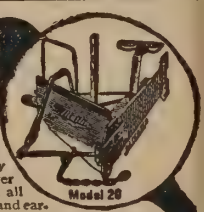
Dont Send a Penny

These Len-Mort Work and Outdoor Shoes are such wonderful value that we will gladly send them to you prepaid, no money down. You will find them so well-made and so stylish and such a big money saving bargain that you will surely keep them. No need to pay higher prices when you can buy direct from us. Why pay $5 and $6 for shoes not near so good?

Great Shoe Offer





This shoe is built to meet the demand of an outdoor city workers' shoe as well as for the modern farmer. Built on stylish lace Blucher last. Special tanning process makes the leather proof against the acid in milk, manure, soil, gasoline, etc. They outwear 3 ordinary pairs of shoes. Very flexible, soft and easy on the feet. Made by a special process which leaves all the "life" in the leather and gives it wonderful wear-resisting quality. Double leather soles and heels. Dirt and water-proof tongue. Heavy chrome leather tops. Just slip them on and see if they are not the most comfortable, easiest, most wonderful shoes you ever wore. Pay only $3.85 on arrival. If after careful examination you don't find them all you expect, send them back and we will return your money.

SEND your name and address; and be sure to state size you want. Send no money. Price only $3.85 on arrival. We send these splendid shoes PREPAID. You are to be the judge of quality, style and value. Keep them only if satisfactory in every way. Be sure to give size and width. Send now.

Leonard-Morton & Co., Dept. 2014 Chicago

Brooks Appliance Co., 467 State St., Marshall, Mich.

the Union of the State Accredited certificate without other test than required for admittance to the Accredited Herd Class. The opportunity of qualifying for the Accredited Herd List is open to all herd owners in the state. The Department welcomes applications and hereby invites the interest and co-operation of herd owners, county agents, breeders' associations, and all other live stock interests in the extension of this project and its benefits.

The testing of herds for this list is done by approved local veterinarians under the supervision of a state or federal employee. Persons desiring to have their herds tested for this purpose should make application to the Wisconsin Department of Agriculture, State Capitol, Madison, Wisconsin.

The approval of all states to the shipment of cattle from the Accredited Herd Class required a thorough advertising of this project throughout the country by this department. Last fall, shortly after this arrangement had been completed, the Accredited Herds project was adopted by all the states in the Union and the United States Bureau of Animal Industry of the United States Department of Agriculture at a meeting of the United States Live Stock Sanitary Association in Chicago, on December 4, 1917. By this action the Accredited Herd System was made a national system. The state of Wisconsin heartily entered into the co-operative plan and from henceforth the Wisconsin Department of Agriculture will co-operate with the Bureau of Animal Industry in this project and the Wisconsin State Accredited Herds will be merged into the State and National Accredited system. The qualifications for this co-operative list will be very nearly the same as those which have been required by the state under the State Accredited Herds project, and all of the herds of the State Accredited List will be transferred to the new list as soon as they have fully qualified. The next issue of the list will therefore be made under the title, "National and State Accredited Herds", and all of the owners of these herds are requested to immediately take steps to prepare their herds for this change, so that they may be represented in the next issue of the list and in the first issue of the National and State Accredited List. This new project and its requirements will be presented in an article to appear in a later issue of Hoard's Dairyman.—Wisconsin Department of Agriculture.

All French Live Stock Declines

Efforts by the U. S. Food Administration to learn what classes of live stock in Europe have shown the greatest losses as a result of the war have resulted in the following figures for France.

They represent the difference between herds on December 31, 1913, and January, 1918, the last date for which trustworthy statistics can be had. There was a decrease in all cases, and the amounts are as follows:

Cattle (Including bulls, oxen, cows, and calves)	
December 31, 1913	14,787,710
December 31, 1917	12,189,000
Total decrease	2,598,710
Sheep (Including rams, ewes, and lambs)	
December 31, 1913	16,131,390
December 31, 1917	9,893,000
Total decrease	6,238,390
Hogs (Including boars, sows, and pigs)	
December 31, 1913	7,036,850
December 31, 1917	4,168,000
Total decrease	2,868,850

These figures may be regarded as minimum decreases, since during the past year, in view of shortage in feed, further reductions have undoubtedly occurred. The large loss of sheep is especially significant as regards both food and wool.

Shrink in Milk

We are milking 26 cows which are doing well. On July 7 a cow whose average was 30 lbs. per day gave 17 lbs. and the next day only 2 lbs. and has not given any milk since. Yesterday we had another cow which did not give any milk. She had been giving 40 lbs. a day. Today she gave 12 lbs. again. We never had anything like this before. The cows seem to be normal. We do not feed the cows in the barn. Our pastures are mostly blue grass and timothy and we have plenty of it. What do you suppose is the cause of this?

Morris, Minn. C. V. FARM.

There is nothing in this account of the matter to give a clew to the cause of the shrink in milk. Common causes would be fright, chasing by dogs, chill, or an attack of indigestion or sickness of any kind.

A rainy day job: Replace the broken window panes in the farm buildings.

Over a Million American Cows

Are Giving More Milk Every Day Because Fed On

SUCRENE

DAIRY FEED

Enlist your herd in this profit-making army, and sell your grain to feed the armies overseas.

Every *Sucrene*-fed cow increases her milk yield 25% over the amount given on ordinary rations. Every herd, cow for cow, is consistently in better health, stronger calf and heavier milk all year, when fed on this balanced, concentrate-rich combination of proved feedstuffs. Every farmer can increase his milk-check and reduce his feed-bill by turning to *Sucrene* for the solution of his feeding problem.

Practically and Chemically Proved and Always Standard in Quality

Sucrene Dairy Feed never varies in its standard analysis of 16.5% protein, 3.5% fat, 46% carbohydrates and 14% fibre. Our wide-spread buying facilities and scientific feeding knowledge enable us to keep this feed balanced in feeding value and reasonable in price.

Sucrene Dairy Feed is made up of cottonseed meal, corn gluten feed, corn distillers' dried grains, palm kernel meal and ground and bolted grain screenings—all pure and of high feeding value in milk-making and body maintaining nutrients. Cane molasses increases its palatability and digestibility and promotes health, while clipped oat by-products give it bulk and easy feeding qualities. It also includes a small percentage of calcium carbonate and salt. *Sucrene* leads in palatability and digestibility. Our mixing methods keep it mealy and sweet in any weather.

Some of the heaviest milking herds in the United States have been fed for years on Sucrene Dairy Feed.

Order a ton from you dealer. If he does not carry *Sucrene*, the attached coupon or a post card giving your dealer's name insures you a prompt supply free, also Illustrated Literature, telling about care and feeding of farm animals.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Buck County Farm Boys' and Girls' Farm Day

O our sows and pigs gain eight pounds of fat per day,
Nine pounds on Saturday, ten pounds on holidays,
O our sows and pigs gain eight pounds of fat per day,
They hate Kaiser Bill. (Tune: The Old Gray Mare.)

The spirit of this song was the spirit of the Bucks County Farm Boys' and Girls' Farm Day, held at the Farm School, Saturday, June 22. There are sixteen clubs of twelve members each in the county, each member raising a pig and pledged to raise it to maturity. The boys and girls came from all parts of the country in wagons, autos, and in large trucks. In one case, the Milford Square Club, 25 members, came to the Farm Day in a large truck. Each member brought lunch with him.

C. M. JOB, COUNTY AGENT, AND THE CALF CLUB COMMITTEE FROM THE BARTHOLOMEW COUNTY (INDIANA) JERSEY CATTLE CLUB, WITH THE BOYS AND GIRLS AND THEIR FINE JERSEY CALVES

Each club selected five delegates to represent it in the judging contests. Local farmers acted as the judge leaders. Horses, cows, pigs, chickens, and corn were judged by the youthful members. Explicit directions were first given and then they had a chance to do the work. Two minutes' time were given for the reasons to be given orally.

The Farm Day gave the boys and girls a chance to express themselves. In as far as was possible, the members were asked to do all the work. They sang the songs and did the judging work. In the afternoon, the president of each club was asked to give a written report of his own club, the activities of the club, and the important gains of pigs belonging to individual members, the feeds used, etc. The Bedminster Club No. 1, Reed Fretz, president, reports as follows: "We have the regular number of members in our club and we hold our regular monthly meetings to sum up the gains. The ages of the members range from 10 to 18 years. Our club has two girls and ten boys. We have eight pure-bred O. I. C.'s, two grade O. I. C.'s, and two pure-bred Chester Whites. The average price paid for these pigs at the beginning was $8. Our pigs weighed 31 lbs. at the start. Just now the average as near as I could get it is 80 lbs. in 72 days. Some of the feeds we use are: Oil meal, wheat middlings, skimmilk, hominy, corn meal, and barley feed. We also have our pigs on pasture. A few club members feed the cut green feed. Our members are much interested in pig club work and we want to help Uncle Sam in this war by producing pork for our soldiers in the trenches. And, by the way, we have great hopes of winning the county prize, too. That is all I have to say and I hope that your pigs are doing as well as ours."

The county leader sent out to each member a little circular giving the following ration as a good one: Corn meal, 400 lbs.; middlings, 300 lbs.; and tankage, 100 lbs. This ration was to be fed in addition to pasture. When all the members were gathered together in Segal Hall in the afternoon, the question was asked as to how many were feeding the pigs on pasture or were feeding some form of green feed.

Fully five-sixths of the members were present to answer "aye." That was the most pleasing feature of the day, because one idea of pig club work is to get the boys and girls to feed pigs by the best possible method. Again the roll call was taken and this time the different breeds of pigs were called for. At the last roll call the gain per day was asked for. About 50 pigs weighed over 100 lbs. at the end of the first two months. About 25 weighed over 125 lbs. and two weighed 148 lbs. in the two months, making a gain of 98 lbs. and 106 lbs. in that time.

COUNTY AGRICULTURAL AGENT.
Pennsylvania.

Starting Dairymen in Bartholomew County, Indiana

On May 4th the boys and girls of Bartholomew County, Indiana, met at Columbus to receive the pure-bred Jersey calves that are to serve as foundation animals for dairy herds in that community. These calves were purchased by a committee from the Bartholomew County Jersey Cattle Club, who worked in co-operation with the local county agent, C. M. Job. These calves were of excellent quality and selected principally from their breeding and production records.

DRAWING NUMBERS THAT WILL BRING WITH THEM PURE-BRED JERSEY CALVES TO THE BOYS AND GIRLS WHO WILL MAKE DAIRYING A PROFITABLE, PLEASANT BUSINESS IN THE FUTURE AGRICULTURE OF BARTHOLOMEW COUNTY, INDIANA

The boys and girls, in accordance with Indiana's club organization, are to be absolute owners of the calves they have drawn. They will feed and care for them in competition for prizes which will be offered at the local county fair at which they are being offered a special class. The calf club work is planned on a three-year basis and the calves will be assembled as bred heifers a year from now, and as producing cows the following year.

Although this is a great corn county, with lots of good hogs and good beef cattle there seems to be a growing demand for more good dairy stock. The county has carried on considerable club work and now the young corn growers are taking a step that will make and perhaps shape their future line of agricultural production.

Indiana. WALTER B. KRUECK.

Junior Letters

Hoard's Dairyman Juniors:—I received my fob, button, and creed and many thanks for them. Our school is out now. It closed the 22nd of May. I am 12 years old, and next fall I will be in the 7th grade. I live on a 120-acre farm. We live 6 miles from town. We are milking 12 cows now. I milk 5 cows in the evening. We have 14 head of cattle including our full blooded Holstein bull. We built a silo 14x38 ft. this spring. We have a 3-year-old colt. We get from 57 to 70 eggs a day now. We keep Rhode Island Red chickens. We have 18 pigs that we are just weaning, also 3 sows. We have all our corn planted. I am going to plant some beans to-morrow in the fields. I can sell the beans in the fall and keep the money.

We have taken Hoard's Dairyman for 14 years and would not be without it. My brother and I have bought thrift stamps. I want to help Uncle Sam win the war. I think I will now close. My address is Huchinson, Minn., R. 4. Evaline Haberstich.

Hoard's Dairyman Juniors:—It has been raining here for two days straight. We have our oats, wheat, speltz, and a few potatoes in; our wheat is up over an inch, and our oats are too. I rolled and dragged everything.

I have begun to raise rabbits and I wish some juniors would tell me how to make a rabbit pen so that they will not get out. My address is R. F. D. No. 4, Stoughton, Wis.

I will have to close, wishing the juniors good luck. Delbert Crawford.

Hoard's Dairyman Juniors:—I will write you a few lines to let you know I am still a junior. We have thirty head of cattle. They are all Jerseys. I had a Jersey heifer two years old. I sold her for $100 and wasn't fresh the night I sold her but was fresh the next morning and had a heifer calf. I wished then I hadn't sold her. I am 11 years old and I am in the fifth class. I have eight white rabbits. We have 80 acres of land. We are going to put in about 35 acres of corn and have already sowed ten acres of oats. We have 5 horses and one little colt one week old. I sold one of my shoats for $13. We have 40 little pigs.

Kansas. Chester Mann.

Hoard's Dairyman Juniors:—This is my first letter to the juniors.

I received my watch fob, button, and creed and I like them very much; though I am a girl I have no use for the watch fob so I gave it to my brother, Edward.

I am ten years old and was in the seventh grade at school this year.

I live about one mile and a quarter from the school house and walk every morning. Our school was out on April the fourth and I am glad it is out, yet I will be glad when it starts again. We had a very nice teacher this year, but I want another one next year, because I like new teachers every year.

I have three brothers and two belong to the Hoard's Dairyman Juniors.

We are milking nine cows of which I milk three. My brother, Ralph, milks one. My mother milks three, and my father milks two.

We have our incubator set with 160 eggs. We have about 125 chickens and three turkeys. Our turkeys are laying eggs and we have 26. There are two turkey hens and one gobbler. The gobbler is cross and runs after everybody, but I am not afraid of it any more, but I used to be. We get about seventy eggs a day and each of the turkey hens lay every day. One of our turkey hens wanted to hatch and we thought it was too early yet so we put her in a coop and she is out again. All of our turkeys roost on a tree and are keeping good and healthy. I would like to hear from some of the other junior girls and wish them all success.

Grafton, Pa. Mary L. Grove.

Hoard's Dairyman Juniors:—I received your letter some time ago and I was glad to hear from you. We have 27 pigs. I am going to buy one of them. We have eight steers, twelve cows, twelve heifers, and nine little calves but we are only milking ten cows.

I have set one hen for myself and twelve for my mother. We have about 130 hens.

My horse is getting along fine. I feed her oats and corn mixed and timothy and clover hay.

I am going to school now. Our school lets out in five more weeks.

Our oats and wheat are beginning to grow.

My brother is testing corn.

As it is getting bed time for me I will close. Wishing all the juniors good luck.

South Dakota. Freddie Blackman.

Hoard's Dairyman Juniors:—I received my watch fob, button, and creed and thank you very much for them.

I live on a farm containing 123 acres of tillable land. We finished plowing our oats ground in March and are pretty well on with our plowing for corn.

We have had very nice weather through the month of March and up until the 8th of April but since that time it has been snowing.

We live along the state road and about 7 miles away from Huntingdon where we market.

We have three pure-bred Guernsey cattle; one is a bull, the other two are heifers.

We also have two other calves which are only grade Guernseys.

We have 6 horses, 9 cows, and some young cattle.

My brother, Walter, who is also a junior is tsting seed corn and it is coming up fine.

We have running water at our barn so it is easy to water our stock.

We have had quite a lot of little pigs this spring. They are Chester Whites. Father has sent away for a full blooded Chester White female pig, 8 weeks old.

Father built a new hog pen last summer. It is made of cement.

I was thirteen years old on the 28th of March, 1918. I was sick on my birthday and did not feel like writing then so I have not had time to write till now.

Well, as it is getting late, I will close for

his time. Wishing all the juniors good luck.
Pennsylvania. Ralph E. Grover.

Hoard's Dairyman Juniors:—I received your letter a long time ago. Today it is just two years since I sent the coupon in to become a junior.

You asked me where we sell our cream. We sell it to the creamery. Nearly all the creameries in Freeborn County have their patrons milk cows for the Red Cross. That is, they give from 1% upward of their cream check. Today I got through with our plowing. I plowed the most of our field this year. We were through seeding our small grain quite a while ago.

I am trapping gophers now. I have caught 2 gray gophers and 3 striped gophers. Papa gives my brother and me five cents for each gopher we catch.

I am buying W. S. S. and thrift stamps now. I wrote a poem about the thrift stamp.

I milk 3 cows morning and evening and feed 1 calf and some of our sows. All our sows have little pigs. We have 37 little pigs out of 6 sows; that, of course, is not so many.

I think it would be a good idea to write our addresses in our letters. Mine is: Hayward, R. R. 1, Minn.

We have only nine cows to milk now. We have 1 registered Holstein bull. We have 3 heifer calves that are getting milk.

I will have to close now as it is time for boys to go to bed.
Minnesota. Russell Hanson.

Hoard's Dairyman Juniors:—I have not written for a long time so I think I will write now to show you that I am still a good member of the Hoard's Dairyman Juniors.

We have thirteen cows, one pure-bred Guernsey bull, two heifers, one of which is mine, and will have a calf the last of August, and seven young calves.

One of our cows bloated on green feed and we had to stick her, and in doing it the cow kicked papa on the ankle and hurt him.

My brother and I have been sawing wood to earn money to buy thrift stamps to help win this war.

I have not been at school because I have been sick.

I wish all the juniors good luck.
California. Robert Larson.

Hoard's Dairyman Juniors:—I received your letter asking me if I had to do anything about the cows. Yes, I have. I milk four cows every morning and night. We feed our cows one-half bushel of silage, about two quarts of feed which is mixed corn gluten and different other kinds of feed. Our cows are now out to pasture.

I was fourteen the 17th of May and in the Freshman A class in the high school.

My brother and I have two pigs and we joined the pig club. The Oshkosh banks paid for the pigs and we pay them back at the first of December. The one who raises the most pork on the least money gets a prize of $7; second, $5; third, $3. We feed our pigs corn meal, Diamond hog meal, ground barley, and ground oats with skimmilk which we buy at 20c for ten gallons. Our pigs, when six weeks old, weighed 15 and 16 lbs.; now they are three weeks, four days old and weigh 30 lbs. The smallest is my brother's; and mine weighs 32 lbs. They are Poland-Chinas.
Wisconsin. Walter Wood.

Hoard's Dairyman Juniors:—I received your letter of May 6 and was glad to get it.

They are building a hemp factory at Pickett, about three miles from where we live. My father rented 20 acres of land to a man and he put the whole piece in hemp.

I set a hen with 12 eggs and one day I brought them in to candle them and my little brother broke some of them. Then I set a hen with fifteen eggs and she went off from the nest. My mother said I should give up the chicken business. One afternoon I was throwing down hay. I found a hen with 14 eggs. I let her set and the day before yesterday she went off from her nest. Then I put the eggs under a white hen and got 10 chicks from 14 eggs. Wishing all the juniors good luck.
Wisconsin. Melvin Miller.

Hoard's Dairyman Juniors:—I received your letter and was glad to get it. You ask me how I got such a fine start so I will tell you. First, I had a grade Holstein heifer, then my father sold her and said he would get me a registered heifer. Last fall he bought 9 cows, a registered heifer among them, from a man in New York. He said I could have her calf. She was fresh about Christmas, but her calf was a bull so I am going to sell him and buy a registered heifer with the money. My father sold my other two pigs and said he would get me a pure-bred hog. My grandfather bought a registered hog. She had three pigs. My father bought two of them and gave me the smallest one. Our cows are Holsteins. We do not have much trouble with scours.

Wishing the juniors good luck. My address is State College, Pa. Fredrich Markle.

Hoard's Dairyman Juniors:—I came out to my uncle's farm June 7th. My school closed June 4th and our picnic was June 5th.

I have my garden planted. It is about twice as large as it was last year and I have beets, radishes, onions, head lettuce, peppers, corn, peas, lima beans, and potatoes.

I took my calf to pasture this spring and will leave her there till fall.

I mow the lawn, help churn butter, and I milk one cow.

I am promoted from grade five to grade six and I am 11 years old. Our school sold Thrift Stamps and War Saving Stamps and our school of eight rooms sold $5,000 worth and our room of 42 pupils sold $1,100 worth, and I sold the most of any pupil in the room and that was about $300 worth and I own $40 worth of stamps and 2 Liberty Bonds.

Our dairy on the farm is doing fine and we ship from 8 to 9 cans of milk a day.

It is getting late now so I will close, wishing all of the juniors good luck.
Pennsylvania. Edward Mesta.

Hoard's Dairyman Juniors:—It has been a long time since I have written to you, so I will write quite a long letter. We are milking twelve cows now and they give a lot of milk. We have 3 horses and 1 colt. The crows, blackbirds, and pigeons are always after our corn. We killed 2 blackbirds and one pigeon the other day. We are making a shed to put our implements in. We are just putting on the roof now. We are going to have a school fair this year. I have got barley this year. I have to grow it, then bale it, and take a sheaf of grain to the fair, also I have to take some of the grain along.
Ontario. Gerald Main.

Hoard's Dairyman Juniors:—I have not written for a long time, so I will write now. Three of them are Jerseys and two are Durham. I have four $5 War Saving Stamps and $6 in the bank. I sold my calf for $15. Papa ships his milk on the train to the Pure Milk Co. I milk two cows every evening and sometimes in the morning.

We had a hog and a calf that died. I went to the apple show last year. Papa gave me an acre of corn. We have 23 acres of wheat. Well, that is all I can think of for this time, so I will close. My address is Franklin Furnace, Ohio. Stanley Kittys.

Hoard's Dairyman Juniors:—I received my fob, creed, and button and am very proud of them. You ask me if our goats were Angoras. They are about half Angoras. The wool of a goat is not like that of sheep, it is longer. We use our goats to eat sprouts. We cut down the little timber and let it sprout up then turn the goats on them. The hair goats are healthier than the Angoras, but the Angoras pay the best. It takes about four goats to the acre the first year and two the next year. We have about 20 acres killed. The goats like to work in rough ground. Well, I will close for this time.
Missouri. Earl Hillhouse.

Hoard's Dairyman Juniors:—I have not written to the Juniors for a long time but as I have time now I will write.

I have my calf now. It is a Guernsey bull calf. It is quite small though. It is not quite pure-bred but pretty close to it. Every night when I come home and Saturdays and Sundays I take it out and give it exercise.

Not much garden stuff is planted in this section but there are quite a number of farmers who have seeded their oats and wheat and barley. Last Saturday my father seeded about one acre of wheat. My brother and I picked the stones off of this piece of land in the forenoon and in the afternoon we went fishing. We did not fish very long and we went down to one of my friends and took their horses and horse-backed them after their cows. When we came back we rode home in their automobile.

Next summer with the money I get from my calf I expect to get a pig and a calf both. I am going to sell my calf next fall if I cannot keep it over the winter.

Wishing the juniors good luck I will close.
Minnesota. Arthur Carlson.

Hoard's Dairyman Juniors:—I have not written for a long time and you have probably forgotten me. My cow, Goldie, freshened March 7 with a fine heifer calf. My other cow, Spot, freshened April 20 with a black and white bull calf. Goldie's calf is a grade Jersey. I am going to raise it. I have been feeding it as it said on page 323 in the October 5, 1917, issue of Hoard's Dairyman. The calf is ninety-four days old. I sold my bull calf for $12 and am buying seeds with the money.

Papa and I have a half acre of Early Yellow Canada Flint corn planted and 5 quarts of Sutton's Excelsior peas, and 1,200 feet of rutabagas. We are going to plant a half acre of sweet corn, a half acre of beans, and an acre of mangels, carrots, and rutabagas. We are going to feed the cornstalks, mangels, and rutabagas to the cattle and the carrots we will feed to the horses. We have a new pair of horses. I was promoted into the Sophomore class of Greeley Institute this year. I wish some of the juniors would write to me. My address is Cumberland Center, Maine. My letter is getting long, so I will close, wishing good luck to all the juniors.
Maine. Ernest Farr.

Hoard's Dairyman Juniors:—It is a long time since I wrote last so I thought I would write again. My two rabbits are dead. We are through planting now. We have ten little pigs that were born the 1st of June. As soon as the little ones were born the sow became very sick. When they were a day old we built a little trough in the pen so the old sow could not get near it, and started to feed the litle ones fresh milk every four hours and that's all they got and they are just as healthy as can be. We have such a big pasture that the cows get all they can eat for the summer so we don't have to buy any feed for them.
Michigan. Ardell Zurcher.

Help Fight the War in the Cornfield

Save 100 Per Cent of the Corn Crop

You can do it with a concrete silo, and keep green fields on tap through the winter.

A concrete silo prevents the 40 per cent waste of the corn crop that happens when corn is harvested in the old way.

You should have a ***concrete silo*** because it is rotproof, ratproof, windproof, fireproof, permanent.

Concrete for Permanence

Kerosene burning.

The Tractor for *all* jobs.

The Turner kerosene tractor has proven to be an all-job machine. Engine experts with 18 years' farm-power experience, who *knew* the *exact* requirements of every kind of farm work, built the Turner to be as efficient for belt work as on the draw bar.

TURNER Simplicity

will positively plow at the lowest possible cost per acre and do other field and belt jobs on the most economical basis. Its economy is not merely low fuel cost, but low upkeep and *long life*. It's a simple, solid sensible tractor—*quality* built through and through, with only *tried* out, *perfected*, standardized parts—such as Waukesha and Buda 4-cylinder heavy duty motors, Foote-Strite transmission, Hyatt bearings, Perfex radiator, Dixie magneto, built-in kerosene burner.

Free Folder describes two sizes—12-20 and 14-25

Good with crops, dairying, machinery, Babcock test, etc. No liquor or smoking, best of reference. J. A. PARTRIDGE, Washington, Vt.

Brown Swiss Auction

The entire herd of registered Brown Swiss cattle owned by Professor H. C. Taylor of the University of Wisconsin was sold at public auction July 16, 1918, at the farm five miles south of Madison.

This herd has been assembled with great care during the past six years by selection from the best herds in this section of the country, and along the best blood lines of the breed, including the Teckla, Ilda, Merney, College Bravura, and Lady Belle families. Professor Taylor sold this fine herd only that he may feel free to undertake war work which will take him away from Wisconsin indefinitely.

Breeders of Brown Swiss cattle assembled from Minnesota, Illinois, Iowa, Michigan, and Indiana, as well as Wisconsin, and enjoyed the hospitality of the farm. Professor Humphrey, of the Wisconsin College of Agriculture, gave an address upon the progress of the herd. Ira Inman, secretary of the Brown Swiss Association, read the pedigrees of the animals as they were sold. L. E. Pennewell of Wisconsin did the selling, assisted by Mott Ayres in the ring. Seventeen breeders availed themselves of the opportunity to secure representatives of this herd. From the standpoint of the excellence of the animals sold and the high prices obtained, competent judges consider this the most noteworthy auction of Brown Swiss thus far held.

Thirty head sold for $9,560, or an average of $319 per head, with the high cow going at $660.

The herd bull, Carl 7th 6165, sold for $500; eleven mature cows averaged $437; eleven heifers and heifer calves averaged $300; and seven bull calves averaged $137.

The list of animals sold with prices of each and names of purchasers follow:

Jacob Voegeli, Wisconsin	
Carl 7th	$500
F. P. Minette, Minnesota	
Ella Martin	$660
Viola of Lake View	465

R. Nesbitt, Wisconsin	
David of Syene	$100
S. M. Graves, Wisconsin	
Una's Cincey	$80

Foreign Food Facts

The Food Minister of France has requisitioned 1918 forage crops. The maximum price for best quality will be $1 for 100 pounds and 86 cents for second quality.

Italy has published a decree requisitioning 1918 crops of wheat, barley, and rye.

The province of Milan, Italy, shows a decrease in live stock, based on the census of 1908, of 21 per cent for horses, 18 per cent for mules, and 8 per cent for swine.

The maximum price for milk in Rome has been fixed at 18 cents per quart. In 1914 the price was from seven to eight cents per quart.

Owing to lack of markets for their corn, farmers in Argentina, South America, are in some cases disposing of it for fuel at 40 cents per bushel.—U. S. FOOD ADMINISTRATION.

In 1917 about 100,000 truckloads of hay and straw were secured by Germans in occupied portions of France and Belgium.

Increased Egg Consumption

Reports on the nation's egg supplies lately received by the U. S. Food Administration show that the number of eggs in storage in the United States on July 1 was practically the same as on July 1, 1917. With this condition, it is interesting to note that consumption had increased about 17 per cent, indicating that production must also have increased in about the same degree. Imports and exports are a negligible factor compared with the enormous size of the egg trade within the United States.

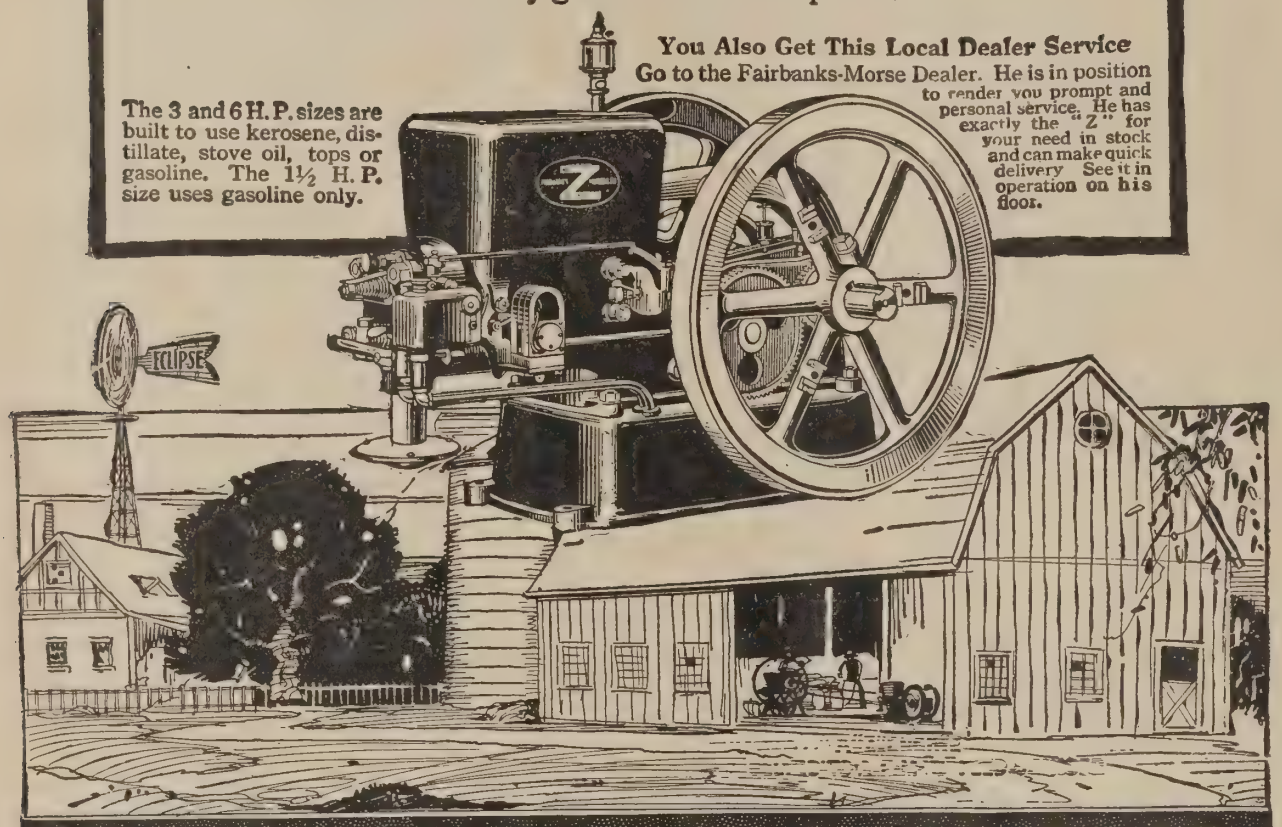
Prices received by producers for eggs have been gratifying, according to reports from the country egg markets, and poultry markets are still short of birds, due, it is believed, to the high level of egg prices.

Jersey Cattle Notes

For week ending July 19, 1918:

Number of animals registered: Bulls, 180; cows, 505; total, 685. Number of transfers recorded: Bulls, 216; cows, 559; total, 775.

Assured Quality Engines



GENERATIONS know that the name-plate "Fairbanks-Morse" on any product assures quality.

This is the famous "Z" engine — all sizes with more than rated power — that over 150,000 farmers have backed with $10,000,000—to do their work best. No farm engine ever before has made such a record.

Cuts fuel costs in two — the 3 and 6 H. P. engines giving more than rated power on *kerosene* at *half* gasoline war-time prices.

You Also Get This Local Dealer Service
Go to the Fairbanks-Morse Dealer. He is in position to render you prompt and personal service. He has exactly the "Z" for your need in stock and can make quick delivery. See it in operation on his floor.

The 3 and 6 H. P. sizes are built to use kerosene, distillate, stove oil, tops or gasoline. The 1½ H. P. size uses gasoline only.

Organizing for Feed Defense

(Continued from page 35)

levels. An abnormal demand situation prevailed, which continued throughout the winter. The result of the price movement is well known to all feed consumers—an advance of $15 a ton was scored in a comparatively short time.

With the foregoing facts in mind, the feed purchasing clubs can compare conditions of the market today with those of a year ago, and thereby gain at least a meager idea of what is possible in price fluctuations. War feed clubs should keep in mind, however, when comparing the trade situation, that new and highly complicated developments may arise in the market which possibly may completely change the indicated course of prices.

One of the most important influences in the market today is the small production of alfalfa in the Southwest this season. The crop is disappointingly light in volume. The first cutting, as a rule, was less than half of normal, and one-fourth to one-half of this harvest was damaged by rains falling as the hay was in the curing process. The second and third cuttings also have been reduced by a lack of moisture. In some portions of Kansas, Oklahoma, and Colorado, the third cutting was almost a failure. These states are among the four largest producers. Nebraska, the other member of this quartet of alfalfa growers, also has only a fair to light crop thus far. Crop experts estimate the production for the Southwest at 60 per cent of normal. Range conditions over the Southwest are only fair, dry weather retarding growth of grass. Parts of Texas are still suffering from drouth, but conditions in the Lone Star State are much improved as compared with a year ago. The world war continues on a much larger scale than at this time in 1917; instead of 250,000 horses and mules "enlisted in the ranks," there are more than 500,000 in the American army, thus requiring practically double the hay used in 1917. The winter wheat crop recently harvested amounted to practically double that of a year ago, and corn crop indications point to a yield above the record of 1917. But corn is not yet made. The oats yield is expected to equal that of last year. Wheat in the Northwest also promises to yield a big crop, unlike the previous year. The larger wheat crop means a plentiful supply of bran and shorts, offerings of which a year ago were extremely light. This means more competition for alfalfa. But federal price regulations insure against low priced bran and shorts, and make high grade alfalfa at the present level cheap in comparison. Large grain yields, however, will affect the car situation adversely. More cattle, hogs, and sheep are being fed this year than in 1917, which will further broaden the outlet for alfalfa. Government estimates on the total production of hay point to a yield of 107,000,000 tons, though this prospect has doubtless been reduced by drouth conditions in the Southwest.

The movement of hay to the Kansas City market is less than half of a year ago, owing to the reduced production, and dealers and other trade interests look for no important increase in the receipts. This is significant. It is too early to estimate the production in the far Northwest, but advices from that section indicate an acreage equal to a year ago has been devoted to the legume. The yield of alfalfa in 1917 in the Northwest was heavy, and, with a mild winter, only little of the hay was required by range cattlemen and flockmasters there. As a result, heavy shipments were made to Kansas City during the early

Get a 2 Man Silo Filler

DON'T be forced to wait for a traveling crew. Fill your silo when your crop is right and when you are ready for it. Refill your silo again later in the season without extra cost. You can get a 2 or 3 man machine in

Silver's "Ohio"

The Logical Silo Filler

4 h. p. up—40 to 300 tons per day capacity.

Silver's "Ohio" is the machine you want this year to make the most of your silage crop. Produce good, cheap feed at home when prices are higher than ever before. "Ohio" cut silage means better silage—fine, even cut lengths—the kind that packs air-tight in the silo. Makes better food for stock.

Remember, the "Ohio" features are not found in any other machine—the direct drive that saves power—the single lever control that means safety and convenience—the beater feed (on the 4 larger sizes) that saves a man's work at the feed table.

spring, this being one of the important factors in the decline of $10 during that season. Feed purchasing organizations should watch closely the progress of the alfalfa season in the Northwest, notably in Idaho and Montana, for if these states raise large crops, the effect of the short production in the Southwest will be offset in a measure. But the Southwest is by far the heaviest producer with the greatest acreage. The Pacific Northwest, of course, usually is a slower seller of the first half of the crop year than the Southwest, as it must first await light on the severity of its winter before it can determine how much alfalfa it can spare. A mild winter may bring heavy shipments from the Northwest if the alfalfa crop there is more liberal than in the Southwest. On the other hand, reverse conditions may be witnessed, with the result that prices would be forced upward.

Still another factor in connection with the Pacific Northwest supplies is the new freight schedules now prevailing, which mean that it will cost more than ever to ship alfalfa hay a long distance. Thus Pacific Northwest alfalfa will not be so bearish an influence if in generous supply.

A review of the market situation fails to bring out a promise of lower prices on alfalfa; instead, the facts point to a higher market. In the event corn matures under ideal conditions and the weather is ideal the remainder of the growing season, which is hard to expect after the irregular rainfall and temperatures thus far witnessed, the present promise of alfalfa markets may be upset. But if the weather continues irregular and not generally satisfactory, and there is no cessation in the war, the buyers of alfalfa who make early purchases, so it is felt in the markets, will be the gainers. Some, naturally, may wait in order to obtain the third and fourth cuttings, which, because of relatively greater leafiness, are prized more highly by dairymen. But those who buy early after taking this leafiness into consideration, will insure a supply of this feed for themselves and be protected against the greatest probability—which is for a rise in the price of alfalfa.

Certainty of Dairying

In the midst of uncertainties some things remain sure, and one of them is the fact that dairy produce will always be in demand. Other industries crop up now and then and for a little while seem to overshadow the faithful cow, but sooner or later she emerges from under the cloud more illustrious than ever and continues her course in life unmoved by her adverse experience, as though nothing in the world mattered so long as she kept her place "in the sun", and produced the best food

APPLETON Silo Filler

Double-type feed — one of the new features.

The best silo filler improvements ever made
—that's what you'll say when you find out about the new Appleton features that save time, labor and money. Thousands who have used the Appleton have proved that it does more and better work per hour than other silo fillers; that it is practically trouble-proof; is safe, requires the least power to run it; and stands up far longer. These facts are from the statements of actual users. Now the

new features make the Appleton the best value ever built.
Be sure you find out all about it.

Free Color Catalog
fully describes and illustrates these big improvements; silo book also free if you want it. Write today.

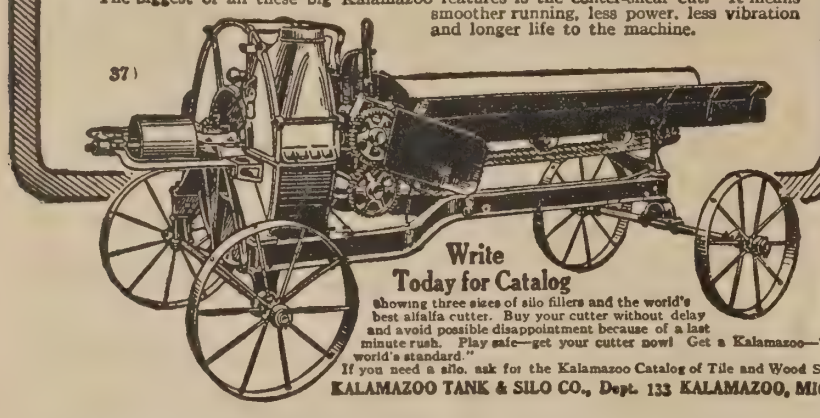
Cut Your Ensilage When The Corn Is Right

It is good business to have your cutter right on the job when your corn is ready for the silo. It pays to cut it at just the right time. Even one week's delay in cutting means a big loss in feeding value. Don't wait till the last minute to order your cutter and don't depend upon someone else to do your cutting, for every cutter in the country will work overtime this year and those who wait will regret. Order a Kalamazoo Cutter now and be sure of getting your ensilage in the silo at just the right time.



Kalamazoo ENSILAGE CUTTERS

Men who study and investigate silo fillers carefully before buying, select Kalamazoo cutters because of these

10 Big Features

1—Malleable unbreakable knife wheel.
2—All working parts covered to prevent accidents.
3—Center-shear cut gives even flow of ensilage.
4—Absence of vibration lengthens life of machine.
5—Less power required because of center-shear and no vibration.
6—Triple feed rollers insure steady feeding.
7—Strong sturdy, life-time frame of channel steel.
8—Reversible shear bar gives four cutting edges
9—Hard oil cups provide ample lubrication for every part.
10—Guard to prevent accident in case belt slips.

The biggest of all these big Kalamazoo features is the center-shear cut. It means smoother running, less power, less vibration and longer life to the machine.

Write Today for Catalog

showing three sizes of silo fillers and the world's best alfalfa cutter. Buy your cutter without delay and avoid possible disappointment because of a last minute rush. Play safe—get your cutter now! Get a Kalamazoo—"the world's standard."

If you need a silo, ask for the Kalamazoo Catalog of Tile and Wood Silos.

ABORTION IN CATTLE

PREVENTED AND CURED PERMANENTLY
YOUR OWN MAKE-SIMPLE. REGULAR BREEDERS BY
STERILOID

STOP LOSING CALVES

TREATMENT: If STERILOID is used at the first sign of abortion the cow will go her full time and have a healthy calf. If your cows or heifers do not come in season, or fail to get with calf, use STERILOID. Cows get with calf after only one treatment. Write today for FREE BOOK. It explains the causes and symptoms of Abortion and tells how to cure Abortion, and make your cows regular, healthy breeders with STERILOID. Also contains letters from breeders who have used STERILOID successfully.

GUARANTEE: We will refund money in every case when STERILOID FAILS to make good. PRICE $1.00. Mailed Postpaid, in plain wrapper.

MARTIN REMEDY COMPANY, Dept. A. 398-408 Columbus Ave., New York City. Reference—Colonial Bank.

to be found for the race and especially for the children.

The experience of the past has demonstrated that the dairy cow is the best proposition on the farm. Those who have pinned their faith to her, and who, through thick and thin, through evil report and good, have given her a reasonable opportunity to make good have not failed. More notes have been met, more mortgages lifted, more barns built, and more homes made comfortable and happy through her influence and stability than through any other medium on the farm.

Will she fail now in her country's peril, when good food is needed as never before and when it will be needed in large quantities for all time in the future? If she fails nothing short of national disaster would be the result. No, she will not fail, and the man who remains on her decks will ride safely over the billows of financial disaster, that may threaten or even shipwreck some other lines of agricultural interest, and reach the port with his colors still flying.—Maritime Farmer, Canada.

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Bunches on Cow

I have a cow that has bunches as large as acorns on her fore leg and shoulder and an ulcer below the knee which does not heal. I first noticed them about a month ago and they have grown larger. She freshened three weeks ago but does not give as much milk as usual and is very irregular in the quantity. She has always been very smart and healthy and seems to be now.

These bunches are just under the skin and are not tender to the touch. What can I do for them, and is her milk safe to use? I have been feeding it to the calf.

Bingham, Me. E. A. B.

The milk is safe for use if the cow has been tested with tuberculin and proved free from tuberculosis. The bunches may be small, fibroid tumors and should be left alone. Such growths sometimes are cancerous and return worse than ever, accompanied by more tumors (metastatic) externally and internally and in such a case the milk would be unfit for use. We take it that you are sure the growths are not warts. Cleanse the ulcer, swab it with tincture of iodine twice daily for three days, and then apply oxide of zinc ointment daily. Make it impossible for the cow to lick the sore.

Breeding After Twins

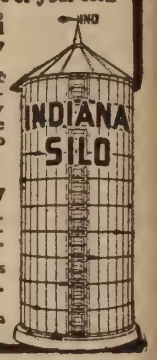
I just had a man pass up buying a cow because she had twin calves last year. He claimed that after a cow has twins they will not breed again. This cow was bred last February and has not come in heat since. Is not this idea false?

Ingram, Wis. J. V. P.

The statement which the prospective purchaser of this cow has made shows that he does not have a wide knowledge of animal husbandry. Any one who is well acquainted with the facts of reproduction knows that a cow which has given birth to twin calves is fully as liable to prove a per-

SILOS for This Year's Crop

Erected without Delay. Ready for Silage Immediately.



THIS year, of all years, you owe it to your country and to yourself to turn your corn crop into silage. Don't think it's too late to get a silo. You can have the kind of silo which 60,000 successful farmers consider the best and have it ready for your present crop. Being the largest silo manufacturers, we have your

INDIANA SILO

on hand ready to ship. You are assured of quick transportation. The silo will reach you promptly. You'll find it easy to erect. You'll have your silo up and ready in ample time.

The Indiana Silo is built of materials which are free from defects, and which do not cause or permit the ensilage to become moldy at the walls of the silo. Staves have tight mortised joints and are interchangeable, making the silo easy to erect. There is no metal spline at the joints to rust out or complicate erecting.

It doubles the feeding value of your corn crop, enables you to keep 50% more cattle on your farm, and get an increased milk flow during the feeding season.

Write to nearest address at once for catalog and full particulars showing how easily you can pay for and make money on an Indiana Silo *this* year.

sistent breeder as is any other cow. Because she has given birth to twins s absolutely no reason for believing hat she will not breed again, that is, nless she was badly injured at the ime of the birth of these calves.

If this cow was bred in February nd has not been in heat since there s every reason to believe that she is it this time with calf.

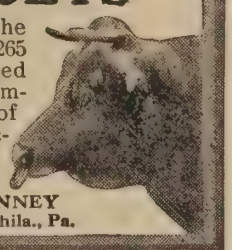
Barrenness

We have a fine Holstein heifer, 15 months ld, that is in good flesh and good size for her ge that has never shown any signs of coming in heat. Is there any treatment or operation that will help her?
Champaign, Ill. H. B.

Massage of the ovaries by way of the rectum may help but can only be properly done by a specially trained and experienced veterinarian. Meanwhile, feed a quart of stove-dried whole oats the first thing each morning and once daily syringe out the vagina with blood warm water containing a heaping teaspoonful of common salt to the quart.

Milking Heifer Before Calving

I have a heifer that was bred in March and is giving milk. I milked her for about a week when I heard it was inadvisable to do so. She gave about two pounds per milking. I have not milked her now for three days. Her bag seems tight but not inflamed; neither is the milk set up.
Holland, Ind. H. W. M.



It is unwise to milk a heifer which "comes to her milk" before she has been bred or within a short time afterward. Such an animal would not produce sufficient milk to be profitable and is very apt to be injured if milking is continued.

With this animal the safe treatment would be to immediately cease milking her. There will be very little danger from udder injury if milking is stopped at once without going through the process of gradually "drying her off". If marked inflammation appears it would be advisable to relieve the udder of distension occasionally.

JERSEYS

MERIDALE JERSEYS

Three sons of The Imported Jap 75265 (sire of 33 tested cows), out of imported Register of Merit dams. Recommended as herd-headers.

AYER & McKINNEY
300 Chestnut St., Phila., Pa.

You should head your herd with the very best butter bred bull, if possible to get.

This week we are offering you a full brother to Raleigh's Foxlett 11734 lbs. milk, 535.87 lbs. butter at 1 yr. 11 mos. of age. He was dropped May 23d, 1918, is a very fine individual and carries that pronounced dairy type that produces at the pail. He carries the blood of Raleigh, Oxford Lad, Financial King, Jimp, Fancy Harry, Flying Fox.

We also offer his half brother sired by Oxford You'll Do's best bred son, dropped June 13, 1917 and ready for light service. This fellow is good enough to win in hot company.

These bulls have the same dam, a large smooth cow, large square udder and teat on each corner. She has given up to 52 lbs. milk a day on herd feed; she is the kind of mother for herd bull, she is 25th Financial King breeding.

Your choice $250.00 delivered anywhere in the U. S. For further particulars address or come to

MEAD SIDE FARMS,
MEADVILLE, PENNA.

We have other bull calves sired by good sons of Oxford You'll Do and Gamboga Knight.

Registered Jerseys

We raise 15 to 20 calves yearly, consequently have an equal number to dispose of from the herd.

Now for sale—six bulls, 2 to 9 months old; two heifers, 10 and 11 months old; all sired by Imported Grandson of Noble of Oaklands. Also four or five fine 3-year-old cows, now milking. E. G. Roberts, Proprietor.
Roberts Poultry Farm, Ft. Atkinson, Wis.

ENTIRE HERD

60 Registered Jersey Cows and Calves 60

For Private Sale

Having recently been elected Secretary and Treasurer of the White Eagle Dairy Company, I will not have the time to give the close attention to breeding and the production of milk which I have in the past and am offering the public a rare opportunity to buy some choice foundation stock, both cows and calves. I have been engaged in the breeding of Jerseys for nearly ten years, and have never had a public sale and will depend largely on my many satisfied customers to buy this stock and will give them the same fair treatment which has characterized my business from the start.

Write me for list of the stock, the milk and fat records, the breeding and prices. This will be your best opportunity this year to select some choice foundation stock, rich in the blood of Noble Oaklands and Oonan of Riverside.

Unprofitable cows have always been culled from my herd. Nothing but good paying cows in this offering.

Five tests of my herd and never a case of tuberculosis.

D. V. VANDIVER, Columbia, Mo.

American Guernsey Cattle Club
Box H Peterboro, New Hampshire

Infectious or Contagious Abortion

Infectious or contagious abortion is at the present time one of the greatest scourges of the cattle breeding and dairy industries. While at present no sure cure for the disease is known, it is essential that all dairymen should understand the nature of it and how best to prevent its spread. The New Hampshire Experiment Station has recently issued Extension Circular 19 on this subject. The publication devotes considerable space to common methods of treating aborters, from which we quote as follows:

"When a cow aborts, the afterbirth usually clings tightly to the cotyledons in the womb and should be carefully removed from them. Previous to this secure a douche can and smooth non-collapsible rubber tube (preferably a horse stomach tube) about ¾ inch in diameter. A douche can may be made by attaching a faucet to the side of a pail near the bottom or to the bottom of the pail. The rubber tubing should be attached to the faucet. The pail may be raised to the desired height by means of a rope and pulley fastened to the ceiling. The cow's genitals should be rinsed off with an antiseptic solution (such as lysol or compound cresol solution) and then the hose should be inserted into the birth canal and down into the womb. About a gallon of the solution may be allowed to run into the cavity.

"Daily irrigations of the womb and vagina should be kept up for a week or ten days, when the cow should be syringed two or three times a week for another week or two. When properly treated, the discharge usually stops in two or three weeks, but the cow should be syringed once weekly until she is bred. She should not be bred for three months after abortion as it takes about ten weeks to properly treat an aborter. Neglect in properly cleaning a cow is apt to result in sterility or at least it will be very difficult to get her in calf. Cows bred before the discharge has stopped are not likely to "catch" and, if they do conceive, abortion is apt to reoccur in a short time.

"To prevent the bull from carrying infection, the sheath should be disinfected before and after each service with about a quart of a 2 per cent solution of lysol or creolin. This may be done with a douche can, injection pump, or a large syringe. The rubber tube or nozzle of the syringe should be inserted into the end of the sheath, which should be held firmly to the nozzle or rubber tube so that the disinfectant may be forced up into the sheath. Some bulls object to this procedure and must be securely tied so they cannot step from side to side or kick at the operator. Care should be used to insert the tube or nozzle gently so as not to irritate the bull. The long tuft of hair at the opening of the sheath should be clipped and disinfected. When it is possible to do so, a separate, clean bull should be used for heifers and clean cows.

"Various agents and means have been recommended from time to time as specifics for the treatment of abortion. For preventing abortion that is imminent no drug seems to be of any avail. As a cure for abortion, carbolic acid has been recommended for fifty years, to be given both subcutaneously and in the feed. However, this remedy has been given up as unsatisfactory by many who have tried it. Recently methylene blue has been hailed as the specific cure but in many herds where it has been tried it has been discontinued because it was found ineffective. There seems to be no evidence that mythylene blue or carbolic acid reaches the uterus where the infection is operating.

"Some dairymen practice selling aborting cows, thinking thereby they can rid their herds of the disease. The fallacy of this reasoning is shown by the fact that new cows and heifers taken into the herd will abort. If a cow is not a good producer and becomes unprofitable after aborting, she should be sold for economic reasons, not as a dairy animal, but to be slaughtered. The practice of selling aborting cows for breeding purposes, thereby spreading the disease, is to be vigorously condemned. Good cows which have aborted, should be retained, treated, and again bred."

Greeting to Farmers

The Federal Board of Farm Organizations wishes to extend the following greeting:

TO THE FARMERS OF THE UNITED STATES:—When our country entered this great world war it was recognized in a peculiar way that food would decide the outcome. Appeals to the patriotism of the farmer were freely and constantly made by the government at the same time that the conditions upon which he might make answer to these appeals daily became more difficult.

In spite of scarcity of labor, in the face of the fact that the prices of much which the farmer had to sell were fixed and the prices of what he had to buy mounted sky-ward and profiteering thrived, yet he has gone ahead bravely, patriotically, and produced a yield per capita of farm operators possibly never exceeded in our history.

Not only has the farmer toiled early and late to produce this food, but the call of the Red Cross and Y. M. C. A. received from his hands a quick and admirable response. In the first two Liberty Loan campaigns the amount subscribed by farmers was not segregated from the total, but in the Third Loan the farmer went "over the top" in splendid shape, as no doubt he did in the other loans though no credit was given therefor. War Saving Stamps are in nearly all farm homes. Whatever calls our government may make for further financial assistance from the farmer—and such calls will be made—will be met fully, generously.

The Federal Board of Farm Organizations wishes to extend its appreciation of this great record, and urge that, in view of the importance of this basic industry in which you are engaged, you will assist us in securing for farmers a full and just recognition in governmental affairs in all matters pertaining to production, transportation, and marketing, to the end that your ability to continue in this patriotic service may not be lost or injured. (Signed)

W. T. CREASY,
Chr. Executive Committee;
CHARLES A. LYMAN, Secretary.

HOLSTEINS

HOLSTEINS
are the most profitable dairy breed. They are the direct result of a consistently scientific testing and breeding system that in a number of years has raised their 7-day butter-fat record from 21 lbs. to over 50 lbs.
Their history should be an incentive to every dairyman to improve his own herd by testing his cows discarding the poor ones and filling their places with pure-bred Holstein Cows. Investigate the large Black and Whites.
HOLSTEIN-FRIESIAN ASSOCIATION OF AMERICA, Box 101, Brattleboro, Vt.

Holsteins At Auction

Send for information about the sales of healthy reliable registered cattle, held at *Brattleboro, Vermont. the First Tuesday and Wednesday of every other month. Come to Brattleboro, the Holstein-Friesian Capital of America.*

Bloomingdale Herd
...HOLSTEINS...
For twenty-five years have been bred for large production and good individuality. Segis Fayne Johanna, the first 50-lb. cow, is of our breeding and made her first 30-lb. record while in our herd. Many of the large producers have been bred here. Foundation stock a specialty.
A. A. Courtelyou, Somerville, New Jersey.

Milford Meadows Stock Farm

Now Offers For Sale

M. M. Rag Apple Oak Denver

A most promising young sire, born June 4, '17. Nearly half white and an exceptionally good individual.

His sire is Dutchland Creamelle Denver Prince, a 36.25-lb. grandson of Colantha Johanna Lad.

His dam, Milford Josephine Oak DeKol, made 22.82 lbs. butter as a junior 2-year-old in June. Her sire is a son of Canary Paul Fobes Homestead and from a 29.55-lb. daughter of Homestead Junior DeKol. Her dam, 31.77 lbs. butter, 616.2 lbs. milk, is a granddaughter of Dutchland Sir Pontiac Rag Apple.

The three nearest dams of this young sire average over 30 lbs., one a junior 2-year-old. His dam is one of our good prospects and is to be retested this winter.

Milford Meadows Stock Farm, - Lake Mills, Wisconsin.

Cloverlawn Johanna Piebe

His five nearest dams average 1,070 lbs. of butter, 23,809 lbs. of milk a year. Highest yearly record bull of the world 2 years old or over. Choice young bulls from our large yearly record cows for sale. 125 head. 29 yearly record cows. State exactly what you want.

JOHN PULS, - HARTFORD, WISCONSIN.

RICHLY BRED HOLSTEIN BULLS

from 5 to 16 months of age and sired by King Korndyke Veeman, the bull with 40-lb. breeding, whose two nearest dams average over 37 lbs. butter in seven days. These bulls are out of cows with large A. R. O. milk and butter records. Write us for full particulars.

Wisconsin Star Stock Farms, Ed. M. Schultz, Hartford, Wis.

A Few Good Ones For Sale

I am offering yearling and bred two-year old registered heifers for sale. Daughters of King Segis Pontiac Polkadot 8th, he a grandson of King Segis Pontiac and from one of the good daughters of Johanna McKinley Segis. A number of these heifers are bred to Sir Aaltje Pontiac Hengerveld, a 33.68-lb. son of Hengerveld DeKol Beets. Also several good young bulls from A. R. O. dams and a few cows in calf to the 33-lb. bull. Write me or come and see them for yourself.

J. D. McDONALD, WEST SALEM, WISCONSIN.

Must Reduce My Herd

QUACKENBUSH for QUALITY HOLSTEINS

Because of lack of barn room. I am now offering for sale some excellent yearling and 2-year-old heifers and a few young bulls. Sired by King Segis Pontiac Polkadot 8th, a grandson of King Segis Pontiac and Johanna McKinley Segis. Some of the heifers bred to Rag Apple Pontiac, a 30-lb. brother to Rag Apple Korndyke 8th. A few of the young bulls sired by him. Write for full information.

W. W. QUACKENBUSH, WEST SALEM, WIS.

King Pontiac Champion

Is now five daughters nearer the century mark, having 80 A. R. O. daughters in all to his credit. Of this number three are State Champions in the 7-day division, one in the 30-day, one in the yearly and another has the distinction of holding the highest 30-day butter record of any cow living in the state. In view of the fact that King Pontiac Champion is now in his prime and in the finest physical condition, that he is at the head of a herd where his daughters will be given the best opportunity for future development and that the production of King's daughters in both short and long distance tests excel those of any other sire of the breed, where can you select a sire whose progeny has a more promising future?

Our prices are reasonable. Write for sale list before selecting a herd sire.

PABST STOCK FARM,
Oconomowoc, Wis.

Save Money On Your Herd Sire

I am now offering several fine bull calves 3 to 6 months old; all of them from dams with good A. R. O. records and sired by a grandson of Sir Pietertje Ormsby Mercedes, whose 3 nearest dams average 31 lbs. in 7 days. You can raise them as cheaply as I can and my price on these youngsters makes it a paying proposition for you to buy your herd sire now and raise him yourself. Write W. P. Kissinger, Waupaca, Wis.

HIGH GRADE HOLSTEIN

Calves, either sex, from heavy producers, well marked, 4 to 6 weeks olds, 15-16ths pure. $25 each, crated and shipped to your station. Express and all charges paid here.

Beaumont Farm Has a Young Bull Sired by King Colantha Rag Apple

positively one of the best sons of RAG APPLE KORNDYKE 8TH. Dam a 32½-lb. granddaughter of the KING OF THE PONTIACS.

YOU CANNOT GET ANYTHING BETTER THAN THIS. Another young bull, out of one of the finest daughters of JUDGE SEGIS, which recently sold for $10,000. Remember that KING COLANTHA RAG APPLE is a brother to the $53,200 bull.

BEAUMONT FARM, MT. SAVAGE, ALLEGHANY COUNTY, MARYLAND

The Only First Prize Winner at the National Dairy Show Having a First Prize Dam and Sire

Sir Korndyke Fytje

We Offer One of His A. R. O. Daughters For Sale

SIR KORNDYKE FYTJE is the best show bred bull in the world—a positive guarantee of type in his offspring.

BOTH HIS DAM AND SIRE won first at the National Dairy Show besides being first prize winners at several state fairs.

THE DAM OF SIR KORNDYKE Fytje made 23.15 lbs. butter at 24 months of age and in a year made 783 lbs. from 18,431 lbs. milk. This was six years ago.

SHE IS A DAUGHTER OF Sir Pietertje Ormsby Mercedes, the greatest yearly record sire in the world, and from

MINNESOTA'S FIRST 1000-lb. cow, Riverview Fytje DeKol Ormsby.

THE YOUNG DAUGHTER of Sir Korndyke Fytje that we are offering made 16.66 lbs. butter in 7 days at 24 months of age.

SHE WILL FRESHEN early in November to the service of King Piebe Ormsby Mercedes, a young bull whose dam made 35 lbs. in 7 days and 1,136 lbs. in a year at 4 years.

HIS THREE NEAREST DAMS average 32 lbs. butter in 7 days and 1,040 lbs. in a year at an average age of 4 years.

SHE IS A SPLENDID heifer for type and size and will make someone a great foundation cow.

THE DAM OF THIS HEIFER made 26 lbs. in 7 days as a junior four-year-old and has a full sister with 26 lbs.

SHE IS SIRED BY Changeling Butter Boy 7th and from a 24-lb. daughter of Queen Piebe of Fairview, one of our greatest foundation cows.

QUEEN PIEBE OF FAIRVIEW made 22 lbs. in 7 days several years ago.

AMONG HER GREAT DAUGHTERS is Queen Piebe Mercedes, 1,389 lbs. butter and 30,230 lbs. milk in a year as a junior four.

THESE ARE BOTH WORLD'S records for her age and no cow, regardless of age or breed, can equal both her milk and butter production.

IF YOU ARE IN THE MARKET for females you want the blood that has produced winners. The pedigree of this heifer contains some of the greatest producing dams and sires in the world.

$750.00 BUYS HER—GUARANTEED SOUND.

The E. C. Schroeder Farms, Box 576-H, Moorhead, Minn.

Cleveland Tractor

A Tractor That Does The Things You Want a Tractor To Do

The Cleveland Tractor is not confined to a narrow field of service. It does the things you want a tractor to do.

It plows, it harrows, it plants, it reaps. Its great power and small size enable it to work satisfactorily in difficult, awkward places. It works efficiently under and among small trees, close up to fence corners, around boulders, on hillsides, over ditches, gullies and rough ground.

With 600 square inches of traction surface, it goes through sand, gravel, gumbo, mud and even wet clay without packing the soil.

The Cleveland Tractor lays down its own tracks, crawls on them, and picks them up again as it goes along—just like the famous war "tanks."

It does *faster* and *better* work than was possible before. It plows 3½ miles an hour—eight to ten acres a day—equal to the work of *three* good men with *three* 3-horse teams under favorable conditions.

But the Cleveland is *far more than just a tractor.* With pulley and belt, it will saw, cut ensilage, pump—and do the things you demand of a stationary engine.

In addition it can be used for hauling the manure spreader, for grading, dragging logs and pulling road machinery.

It develops 12 horsepower at the drawbar and 20 horsepower at the pulley. Yet with all this power the complete machine weighs less than 3200 pounds, and can be housed in less space than is required for a single horse.

Rollin H. White, the well-known engineer, designed the Cleveland Tractor. It is built under his personal supervision, and is constructed for long service. The track sections are joined with hardened steel pins which have their bearings in hardened steel bushings. Gears are protected by dirt proof cases and are of the same high quality as those of the best trucks. The finest materials are used throughout.

Farming today demands the most comprehensive machinery obtainable—machinery that is useful in doing *many* different things—machinery that is adaptable to widely varying conditions.

Thousands of farmers are looking to the Cleveland Tractor in the present crisis. And the Cleveland is meeting the demands—severe as they are—and is *making more money* for its owners.

It is truly the tractor that does the things you want a tractor to do.

Nearly every farm can use one or more Clevelands to speed up production and cut down costs. Write *today* for complete information and the name of the nearest Cleveland dealer.

The Cleveland Tractor Co.

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LVI — FORT ATKINSON, WIS., AUGUST 9, 1918 — Number 3

Price Fixing and Cost of Farm Products

MANY who in the past have been satisfied to leave the fixing of prices of farm products entirely to competitive forces operating under the law of supply and demand now see the need of commissions to adjust prices. The price commission, to be successful, cannot represent a class, but must stand for economic justice to all classes. The condition and needs of the producer, the distributor, and the consumer must be considered with equal care. The biggest problem in price-fixing is to get the facts needed as the basis of action.

For many years the idea of price control has received the attention of farmers who have been hard pressed to make both ends meet. Dollar wheat sounds cheap now, but at one time it looked like a cure-all for the ills of the Dakota farmers. The control of cotton prices has often been talked about in times of low prices, and the price of Burley tobacco was more than doubled by the concerted action of farmers in holding their product and refraining from growing a crop in 1908. In all this agitation it was argued that the price should be enough to pay the cost of production and a reasonable profit. This point of view stimulated interest in farm cost accounting as a basis for price-fixing.

The United States Department of Agriculture and many state experiment stations have co-operated with farmers in keeping detailed records of man and horse labor, the use of equipment, and other elements of costs, as well as the yield, in quantity and value, of each kind of product. Occasionally a farmer has undertaken detailed records on his own initiative and without official aid, but the amount of clerical work in keeping a complete system of cost accounts is more than most farmers have time to do.

In the official promotion of farm cost accounting, the purpose has not always been well defined; but there have been at least two points of view. A position taken by many who are interested in the marketing problem is that costs should be known in order that they may be used as a basis of price-fixing. A view held by men interested in the problems of farm management is that cost accounts show the relative profitableness of competing crops and live stock enterprises, and hence give the starting point for scientific farm management.

It would seem that the Federal Food Administration in fixing the price of wheat, and the Chicago Federal Milk Commission in its work of the past winter, assumed the cost of production as the foundation of price-fixing, yet when these officials have approached the final problem of price-fixing, they have found themselves confronted with unexpected difficulties.

"YE HAPPY FIELDS! UNKNOWN TO NOISE AND STRIFE
THE KIND REWARDERS OF INDUSTRIOUS LIFE."—JOHN GAY

Why all this difficulty in the use of cost accounts as a basis of price-fixin? There are doubtless many reasons, but there are three of unusual importance: First, variation in costs; second, joint costs; and third, disagreement in the elements of costs. But in spite of these difficulties, accounting may be used in price control.

Variation in Costs

There is a very wide range in the cost figures which have been secured by careful methods of accounting and there are wide ranges in the estimates of costs of different producers. On the basis of a farm management survey made on 51 farms in one dairy district in Wisconsin, the return per dollar of annual outlay ranged from 77 cents to $3.05. The results of the Wisconsin Dairy Cow Competition carried on in 1909-11 illustrated this point. The return per dollar's worth of feed consumed by the 398 cows in this contest varied from 92 cents to $2.71; the average of the best ten was $2.38 worth of product per dollar's worth of feed and the average of the poorest ten was $1.11.

With wide ranges in the costs of production, which cost shall be accepted as the basis of price-fixing? The average has been seriously suggested but abandoned in disgust when it has been realized that a price fixed on the basis of average costs would probably result in a loss on half the farms.

The marginal or greatest costs have also been suggested. Economists have a theory that prices tend to equal marginal costs; this is thought to be true because it is assumed that the man who is producing at a loss will drop out; or, if the supply is short, the price will rise to the point attracting others less favorably situated to enter the same line of production and thus keep the price and the greatest cost tending to equal, though at any given time they might be far apart. There seems to be some relation, therefore, between the highest cost necessary to produce a given supply and the price which in the long run will have to be paid in order to get the supply.

Disagreements Regarding the Elements of Cost

The price at which to charge the supplies which have been produced upon the farm presents further difficulties in the efforts to determine costs. Shall feeds be charged at cost of production or at market price? In calculating the cost of a 1918 corn crop, should the seed corn be charged at the cost of production or at the market price? A similar question arises with respect to seed potatoes. In figuring the cost of milk the question rises: Should the hay, the oats, and the corn produced on the farm be charged on the basis of cost of production or at the market price? There seems to be an accepted rule of accounting which gives definite directions to charge all the produced supplies at cost and not at market price. On the other hand, farm cost accountants connected with the United States Department of Agriculture and the various experiment stations have quite generally charged these produced supplies at market price minus the cost of delivering them to the market.

A few years ago when the point of view was that of proving that dairying was profitable and an industry which should be stimulated by the press in every way possible, one agricultural paper held tenaciously to the old accounting rule of charging feed to the cows at cost of production because this magnified the profits of dairying by throwing the field profits into the dairy account. Now that the point of view has changed and the price of milk is looked upon as the objective point in cow cost accounting, this same paper is definitely of the opinion that produced feeds should be charged to the cows on the basis of market price. It is not difficult, therefore, to understand why there should have been two opinions on this point before the Chicago Milk Commission. Each party accepts the rule of accounting which best serves his interest.

If there were two methods of testing the amount of butterfat in milk, one of which favored the farmer and the other the purchaser, this same alignment of the interests would doubtless be formed. Fortunately there is one accurate fat test accepted by all, hence this occasion of trouble is avoided. What is needed to settle this question in accounting is one correct rule based upon the economic principles underlying the case. Obviously both of the opposed rules cannot be based upon a sound founda-

Basis on Which the Department of Agriculture Standardized Wheat

The following extract from a bulletin issued by the Bureau of Markets will give some idea of the thoroughness of research which preceded the standardization of wheat and the price which has been fixed:

"The facts collected by the Department during the 10 years of systematic study of the subject of wheat grading cover every step in the marketing of wheat from the time it leaves the wheat field until it reaches the consumer. These facts resulted from an examination of a large number of samples collected from the threshing machine, from the farmer's wagon at the country elevator, from the car upon its arrival at the central market; samples taken before and after grain had passed through terminal elevators and mixing houses; samples taken from the grain as it arrived at the mill and from the mill stream on its way to the rolls; samples taken as the grain went aboard vessels at seaboard markets and as it was discharged from vessels in foreign ports. Upon information obtained by examination of thousands of such samples representing as they do, wheat at every stage of marketing, supplemented by personal study of the inspection procedure in the principal markets of the United States, the Department issued the present standards of wheat. It is apparent, therefore, that in securing the information upon which the standards were based no single interest has been favored at the expense of any other."

The foregoing is a very clear and illuminating statement of the important action taken by the Department of Agriculture and should prevent a vast amount of misunderstanding.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

An Amateur's Confession

Cow, I am done—I'm defeated.
Milking is not in my line.
Maybe, however, you've cheated—
Anyhow, Cow, I resign.
It takes a hero to do it.
There is a knack to the game.
There is a trick—and you know it.
What I produced is a shame!

Gee, you were nervous and balky.
How could I handle the job?
Milk—if I want to grow talky—
Sticks like green corn to th' cob.
Cow, you looked back at me, mooing—
Pitied me—knew I would fail—
Wondered what I could be doing.
Then you kicked over the pail!

Oh! but the task it looks easy,
When someone else has the stool.
They have an air, brisk and breezy.
I—well I felt like a fool.
Here I've been fussing for hours,
What can I show for it, Cow?
Milking!—the soul in me cowers
Leave it to those who know how.

A Matter of Aim

"How is that new helper you've got to milk the herd?"

"Had to fire him—wasn't practical."

"What was the matter?"

"Oh, he had a cross-eye, and every time we milked, we had to put five buckets under the cow, so's he'd be sure to hit one of 'em."

Philosophy of the Oldest Dairyman

"How anybody can be cruel to a cow after once looking into them fine eyes of theirs I can't figure out."

"Sure cows have a pull—you can tell that by the way some of 'em lift mortgages off farms."

"The good Lord made crows and put 'em in corn patches, just as a test to see how long folks could live without cussing."

"You can begin to look for the best when your eldest daughter would rather play the cream separator than her pianola."

Where Honor is Due

It was at Washington and the lobby of the big hotel was crowded with important people, brought together by patriotic duty. Suddenly the crowd began to surge to a certain corner surrounding a thick-set gentleman in a slouch hat. They fought to shake hands with him.

"Who is that—a United States Senator?" inquired the casual observer.

"Nope," was the answer.

"Congressman, mebbe?"

"Wrong again."

"Head of one of the big committees or the Secretary of the Navy?"

"Ho, he's the owner of as fine a dairy herd as there is in the state and he's just won five medals out of a possible six."

Don't Believe All You Hear

The hired man called his farm chum and they walked softly to the door of the barn. "I just want you to listen," said he, "the boss must have struck up a love affair with one of them farmerette gals. Hold your ear close."

And this is what they heard:

"You dear old thing—bless your heart—I certainly do love you—my pretty girl—just the sweetest thing that ever was—I wouldn't swop you for a million dollars—you're all the world to me—put her head up against papa's."

"Humph!" grunted the second hired man, "he's just talking to his favorite Holstein—she won him a cup yesterday at the state fair."

This is a 750-lb. latest style

DE LAVAL

CREAM SEPARATOR

Acknowledged by cow owners the world over to be the closest skimming, the easiest running and the longest wearing separator.

360 pounds of butter would have been needed to buy this machine in 1914.

255 pounds of butter will buy it now.

96 bushels of wheat would have been needed to buy this machine in 1914.

55 bushels of wheat will buy it now.

139 bushels of corn would have been needed to buy this machine in 1914.

87 bushels of corn will buy it now.

There never has been a time when you needed a De Laval so much.

There never was a time when you could so well afford to buy it.

Don't waste food and money and time trying to get along without a cream separator, or with a half-worn-out or inferior machine. Order your De Laval NOW when you need it most.

Why not see the nearest De Laval agent at once? If you do not know him write to the nearest office for new catalog or any desired information.

The De Laval Separator Co.

Winnebago County, Wis., Guernsey Breeders' Picnic

BETWEEN 750 and 1,000 people from eight different counties met at the first annual picnic of the Guernsey breeders of Winnebago County, Wisconsin, June 14. About fifty families of city business men were entertained as guests of the breeders. A parade of twenty-five selected Guernseys was a feature of the inspection of the animals assembled from a number of herds. A boys' and girls' judging contest was conducted by E. A. Onsrud of the American Guernsey Cattle Club, and a breed type demonstration was given by Professor George Humphrey of Madison.

TWO GUERNSEY HEIFERS OWNED BY GEO. HYDE
They were used by Professor Geo. Humphrey in a demonstration of breed type at the first annual picnic of the Winnebago County Guernsey Breeders' Association.

SISTER SUE'S YEOMAN, HERD SIRE OWNED BY JOHN BLOOM
This good Guernsey bull was sired by Yeoman and out of Sister Sue of Mosegiel whose two-year-old record was 10,622.26 lbs. milk, 582.37 lbs. fat. Such bulls as this guarantee the future of the herds where they are used. The production back of them and their vigorous strength of individuality give large promise that their offspring will be profitable animals.

A GLIMPSE OF THE BOYS' AND GIRLS' JUDGING CONTEST
In the older group the winners were Ervintah Bloom, Alvin Auckerson, and Merle Mosely; in the contest for younger boys and girls, the winners were Lawrence Tice, Leone Burdick, and Fern O. Harrow. The privilege of attending such gatherings and engaging in interesting competition in judging high class stock keeps farm boys and girls on the farm.

FOUR BREEDERS WHO ARE LEADING IN THE WORK OF BREEDING IMPROVED GUERNSEY CATTLE IN THEIR COUNTY
They are members of the executive committee of the association. From left to right they are: Slayton, Bloom, Mosely, and Foote.

Organizing for Feed Defense

SANDERS SOSLAND, MISSOURI

I. COTTONSEED AND LINSEED FEEDS

EXCEPTIONAL conditions — even for war time—prevail in the cottonseed and linseed feed trade. Besides the restrictions promulgated by Washington, which affect these commodities more severely than many articles of export, the trade is confronted by unusual crop and supply influences. No dairyman can dismiss the trade situation in cottonseed and linseed products with the feeling that "it's all on account of the war", but all who buy these feedstuffs must go deeper into the markets and govern themselves by the necessity of guarding against shortage or higher markets.

War feed community purchasing organizations can best solve the problem of abnormal conditions in the cottonseed and linseed feed trade by insuring their members as plentiful a supply as possible of the commodities for winter's use, which, briefly, means early buying. With a knowledge of factors affecting both cottonseed and linseed feeds, leaders of war feed clubs will hesitate only little in reaching a decision for early purchases.

The losses suffered by dairymen and other live stock handlers the last few years as a result of delay in purchasing cottonseed and linseed feed for winter probably aggregate relatively a greater total than in any other feedstuffs. Where stockmen suffered only lightly in direct money losses by delaying their purchases, doubtless there was a heavy loss because of their inability to obtain the feeds at the critical moment.

The serious drouth in the Southwest a year ago, particularly in Texas, furnished a huge outlet for cottonseed feeds. Rather than permit their cattle to starve because of a lack of grass, Texas cattlemen paid record high prices for cottonseed cake and meal. Such a great demand prevailed in the Lone Star State, the heaviest producer of this feed, that supplies intended for other territories were cut off temporarily, and later the United States Food Administration found it necessary to fix prices on cottonseed feeds. Present conditions in Texas, while not as serious as a year ago, will necessitate the consumption of large quantities of cake and meal the coming winter. Other portions of the Southwest, extending to Kansas and Oklahoma, will require more cottonseed cake and meal because of a lack of moisture which has stunted growth of pastures and other crops. It should be remembered that a very small crop of alfalfa hay will be produced in the important hay growing states of the Southwest this year, thus forcing enlarged consumption of cottonseed feeds. Corn, too, is not highly promising in that territory.

Prices on cottonseed meal fixed after voluntary agreement between the United States Food Administration and seed crushers of Oklahoma, Arkansas, Texas, and other southern states, still are in force and no intimation has been given the trade by Washington food officials that the schedule will be eliminated on the new crop. There is a possibility that changes will be made, such as the fixing of a maximum price rather than a fixed level, or prices may be regulated by natural demand and supply conditions. It is only guesswork now, however, for one to attempt to analyze the probable course the food officials will take.

The fixed price on cottonseed feed, f. o. b. Oklahoma and Arkansas points, per ton, in car lots, are approximately as follows: 38½ per cent protein meal, $49; 41 per cent, $51.50; 43 per cent, $53.50. When purchased through dealers, another $1 per ton, the permitted profit for rehandlers, is added. Another important point in the federal regulations of the cottonseed feed industry is the fact that all forward sales are limited to 60 days. War feed clubs should have this in mind when making purchases for forward delivery.

Optimism prevails over the outlook for nearly a record crop of cotton, although recent weather in Texas, the largest producer, has been unfavorable. The July forecast of the Department of Agriculture indicates a crop of 15,325,000 bales of 500 pounds each, the second largest crop in the history of the country. The actual yield in 1917 was at a low point, 11,300,254 bales; in 1916, 11,449,930 bales were produced; in 1915, 11,191,820 bales; in 1914, 16,134,930 bales, the largest crop in history. The area sown to cotton aggregated 37,073,000 acres, compared with 34,925,000 acres in the preceding year. The acreage picked in 1917 was only 33,614,000 acres; the area picked in 1916, 34,925,000 acres; the largest area ever picked was 37,089,000 acres in 1913. Thus far, no abandoned acreage has been reported this year. The condition of the crop also is relatively high, being 85.8 per cent of normal on July 1, 1918, against 82.3 per cent on June 1, 1918, 70.3 per cent on July 1, 1917, and 79.4 per cent as the 10-year July 1 average. These figures are given because of the relation between the production of cotton and of cottonseed, the latter being a by-product of the staple and the commodity from which cottonseed feed is derived.

Flaxseed from which crushers, in the Northwest, manufacture linseed meal, gives hope of an increase in production. However, the condition of this crop on July 1 was below a year ago, and it has since deteriorated. The Department of Agriculture forecasts a crop of 15,800,000 bushels, compared with the 1917 crop of 8,500,000 bushels. The average produc-

Where Water and Cows Win

California Finds Gold in the Irrigation Ditch

L. L. DE BRA, California

BACK in '49 and the early fifties many a prospector paused in his climb up the steep slopes of the Sierras, wiped the sweat off his forehead with the sleeve of his flannel shirt, and looked off in the distance where the great interior valley lay baking in the hot California sun, and the thought no doubt came to him that there was an agricultural kingdom of inestimable wealth—all it needed was water. But water there was none, so the miner continued to swing his pick at the outcropping ledges seeking the gold he expected to find in the barren hills, and gave no further thought to the fertile valley at his feet.

Today, the farmer on one of those little valley farms sits of a summer's evening on his cool porch, looks off in the distance at the barren hills glinting in the last rays of the setting sun, and with his crops in mind, says thankfully: "There's gold in those hills."

But he isn't thinking of the yellow gold the old prospector spent his last days trying to find; he's thinking of the silvery streams of water that come foaming down the hillsides to make the arid valley blossom forth into a garden of wealth. For it was the irrigation engineer who found the gold in the hills. He harnessed the melting snows and put them to the farmer's use.

The marvelous change irrigation has wrought in the valleys has been aptly described by some one in this way: "For forty years the old dry farmer jogged to town perched on the seat of an old farm wagon bought with the profits of his 640-acre farm. When irrigation came, the farmer found he could make more on 50 acres than on the whole 640 under the old way. So he sold the balance, hired men to run the 50 acres for him, and now he rides around with the family in an automobile."

This is not the highly colored talk of the real estate agent but the cold, straight-from-the-shoulder facts from records of banks and business houses. And it is a noteworthy point that most of the money has been made because irrigation made it possible to supplant farming with dairying. A few years back, Humboldt County, long the "Banner Butter County", was turning out annually close to five million pounds of butter while the old wheat counties in the valley were at a standstill and wondering whether they'd continue to grow poor trying to raise grain on worn-out land, or invest money in an irrigation scheme and try dairying. You could buy plenty of that land then for $25 to $35 an acre. The irrigation ditches were put in finally, and they turned the water on the thirsty soil. As though by a miracle the brown, dead, grain land blossomed into wide, green fields of alfalfa. The ditches were not of cement at first, and the cool streams of water running along between banks of green looked mighty good to Old Bossy, so the gentle Jersey and the homely Holstein meandered down the streams and almost overnight that land that went begging at $30 an acre went up to $300.

The cool streams of water running between the green banks of the irrigation ditches of California look mighty good to Old Bossy, while her owner looks off from his fertile valley that was once disdained by the gold prospector and in the distance sees the barren hills and mountains glinting in the last rays of the sun. The farmer and the prospector are as one in the thought: "There is gold in those hills for me." The former looked for the yellow metal with pick and "pan", while his present day prototype, the dairy farmer, sees the streams of mountain water trickling down to his thirsty acres to make them break forth into the green succulent grasses that are transformed by the alchemy of the cow into the healthful growth promoting products that babe and man demand in ever increasing quantity. The dairy farmer sees the good in yonder hills and is content.

Then it was the California State Dairy Bureau found it necessary to revise their figures on butter production. They used to have it standing in type from year to year that "Humboldt County, because of its ample rainfall, produces far more butter than any other county." When figures began to come in from the counties in the interior under irrigation they seemed unbelievable. Stanislaus, formerly a wheat county, had broken Humboldt's standing record! Imperial County, formerly a barren desert, home of the horned toad and deadly rattler, had produced 5,000,000 pounds of butter! That was back in 1913. In 1914, Imperial went to nearly six million, while Stanislaus went over the top at eight million. Humboldt straggled along in the rear with a little over five million pounds, and was closely crowded by a little stranger, Tulare County, with a record of 4,362,290.

Investigation showed that the irrigation ditch was behind the whole thing. With irrigation, Imperial county, since its formation in 1908, has increased its butter production from a little over a million pounds of butter in 1909 to over four million. Tulare county, in the same period, has more than doubled its butter output and now crowds the five million mark. And Stanislaus, once the home of the wheat king and cattle ranger, now the home of the Holstein and the Jersey, is now the "Banner Butter County" with an annual output of from nine to ten million pounds of butter.

OUTLET FROM THE PUMPING PLANT OF THE PATTERSON IRRIGATED FARMS IN STANISLAUS COUNTY, CALIFORNIA

Some idea of what irrigation has done for the butter industry of California is shown in the following table giving the butter production of the state since 1913. The slight falling off in 1917 was due to the increased production of cheese and condensed milk because of war conditions: 1913, 55,542,709 lbs.; 1914, 59,286,460 lbs.; 1915, 67,549,409 lbs.; 1916, 70,030,174 lbs.; 1917, 68,373,021 lbs.

There used to be an old joke about the dairyman making money by putting water in the milk; but it's no joke that by putting water on the land, California dairymen have boosted the total annual value of all dairy products from something over thirty million in 1913 to fifty million last year.

Some idea of the extent of irrigation projects in this state can be gained from the figures of the Department of Agriculture which show that close to five million acres of land are now under irrigation in California. They believe that in a few years more, taking into consideraton the many irrigation projects now under way, the total irrigated land in this state will aggregate close to ten million acres. It has been shown that the best agriculture, especially in this state, is founded on irrigation. Even in portions of the state where rainfall is ample, irrigation is being practiced or projects are under way, because with irrigation the land may be given the required quantity of water at the right time instead of being flooded by heavy rains one month and subject to a severe drought the next two months. They're irrigating in old Humboldt county now!

All the streams have been surveyed and it has been figured that with just the supply in the larger streams it would be possible to cover the 14,000,000 acres of agricultural land in California to a depth of 36 inches, which is ample for all crops. In other parts of the state there are good wells. In parts of the interior they depend on the snows in the mountains, and this year there threatens to be a shortage for those dependent on that source.

More than half the improved farms of the state are now under irrigation. Over one-fifth of all the irrigated land in the United States is in California. California has the highest priced irrigated land in America. In no other state is there so great an area of fertile farming land for which the available supply of water is so large and in no state has water for irrigation reached so high a value or been so carefully and economically used. We do not say this boastingly; we say it with sincere thankfulness.

Cost of Keeping Work Horses

Results of investigations on the cost of horse labor on the farm by the University of Missouri College of Agriculture show that, exclusive of depreciation, the average cost of keep per head of 75 farm work horses during 1912-13 was $92.33; of 113 head for 1914, $95.58; and of 132 head for 1915, $86.63; or an average for the whole period of $91.22.

It was found that the cost of feeding, as a rule, made up 72 per cent of the total cost of keeping a farm work horse. Farms on which the feed cost per head ran lowest (average $45.69 per head) fed an average of 10.3 bushels of oats per head to work stock, while farms on which the feed cost per head ran highest (average $93.25 per head) fed an average of 41.6 bushels of oats per head to work stock. Farms which used corn for grain and no oats had an average feed cost of $58.79 per head and received approximately the same amount of work from their horses as farms which fed oats almost pound for pound with corn at a feed cost per head of $71.56.

The average amount of labor per horse for 1912-13, 1914, and 1915 was found to be 1,165 hours, 1,164 hours and 1,127 hours respectively. The heaviest working of horses with the most liberal feeding or the lighter working with approximately a maintenance ration did not in general prove as economical from the viewpoint of horse labor cost as medium work on a moderate ration. From the viewpoint of economy, experience seems to warrant keeping sufficient work stock on a general farm in the region so that each horse will not have more than an average of 1,400 to 1,500 hours work, but it will not warrant a large enough supply to make the average amount of labor per horse less than 800 hours.

Records from the farms indicate that mules do more work on a given cost than either geldings or mares, and likewise geldings do more work than mares.

America's glorious privilege is to feed the world while it fights its way to freedom.

How To Judge a Dairy Cow

CHARLES L. HILL, Wisconsin

'O lay down something as a fundamental principle in the selection of he dairy cow, I would say that the rst point is that every single bit of eef tendency that you get into the airy cow hurts her as a dairy cow, nd the opposite is just as true, that ery bit of dairy blood you get into ie beef cow and steer hurts them for ieir purpose in life.

That is not saying that the two ings cannot be combined into a ual-purpose cow, but if you want to into either branch of the industry the extreme of profitable produc- on, you must have an animal that is ed for the purpose in view. All of ie things of which I will speak are ndamental to the profitable dairy w regardless of the fact of what e, particular color, or previous con- tion of servitude may have been rs. You may have a cow that, af- r you have learned to judge a dairy rm, may look to you to be of the eal form, conformation, and tem- rament, and nevertheless you ven't a dairy cow because there is mething about her that makes her very little use in the world as a iry cow.

Constitution

A cow cannot produce or reproduce less she has what is ordinarily rmed a constitution. If there is any e thing that is most elusive about cow, as it is also about a human be- g, it is this constitution of the cow. fferent people in talking about this bject will give different ideas of at they claim constitute constitu- n, and when you get through with a w after five or ten or twenty years' rk, the cow that you thought did not ve any constitution to start with is ll doing business at the old stand, ile the cow that you picked out as ing of the right build to have con- tution is dead and forgotten. I have mind one Jersey cow that was in my ighbor Scribner's herd, named "Ma- e Surprise". She was one of his own eeding, and every time we had the ys over from the University on eir annual students' trip, much at- ation was paid to this cow that is of most ideal type, but just the same e lacked constitution according to e judgment of the boys, but that w was still producing profitably at e age of seventeen years, while ner cows that we all passed as hav- g constitution have passed on long o.

I am not going to tell you how to d out about this most important ing in the dairy cow, this constitu- n, because personally I have con- ded I don't know anything about The ordinary things that we talk out most are, that as you stand king at that animal from the front, u see that the front legs are set ll apart and that just back of the oulders there is no droop to make at we call a smart heart girth. ey should have lots of room for g and heart work and power.

As I look at the cows of the United ates, all over this country, I con- de that those things that we talk out as constitution we know very le about.

The Front End of a Cow

A cow cannot produce if she cannot . The two evidences perhaps that can see most clearly in an animal indicate that she can eat are, first, t she will be wide at the muzzle l that she will have a strong jaw l a rather thin neck. Those things m to go with a bright yet quiet ression of the eye; they seem to go h that thing in the dairy cow that call ability to consume. If she has se things, you will find with them a great large belly that gives that cow a place to put this food after she eats it.

As you stand in front of her and look at the cow, you may see that she is very deep in the middle, and you say she has capacity all right. Not necessarily; she may be so slab-sided that she hasn't a large barrel; or, on the other hand, you may find that she is not deep, but she is round, not flat, and very much longer than the cow that perhaps looks deep.

You must remember that I speak of an ideal cow. I mean the ideals that conform to what we have in our mind. The ideal form of the dairy cow is that she shall be medium in length, fairly well sprung in the ribs, and deep. All good cows must have great capacity, but some get that capacity by being longer and rounder and not so deep.

The dairy cow is the opposite of the beef cow. We want in the beef cow that tendency to put on flesh and fat on those places in the animal's body that make the highest priced cuts of beef. She will have a tendency to so use her food that her flesh will be developed in those places where we want it to use as high priced beef.

The beef cow must have the same ability to consume and digest food as the dairy cow, but the difference between the two would be, first, in the leaner, cleaner face and the slimmer neck and greater broadness at the shoulders of the dairy animal, while in the beef cow (we used to say you could pour a bushel of shelled corn on her back and it wouldn't run off)—the back is kind of hollowed out. The back of the dairy cow slopes off and cuts off in the ham, while in the beef cow it should go straight down, making a great, big round steak. The things that evidence the ability to consume and take care of food must be largely the same in the two animals, but you must get away from any inclination toward beefiness in the cow if you want her to be a profitable dairy cow.

She must be sharp at the shoulders and slightly flattened out to the point of the short ribs and then moderately sloped.

There are many things that as dairymen we ought to let the breeders fuss with, things that are what we call fancy points in the cow. I can remember the time when in order to judge a dairy cow you should see that she was free of black color. In those days one very essential feature of an animal was that her tongue should be black, and this applies to all breeds. You should see a Jersey cow, and somebody would say, she is fine but she has a black nose; or something else, some other little point that is absolutely non-essential to the usefulness of the dairy cow, the kind that we want to keep on our farms for the sole purpose of the profitable production of milk.

If you go to buy a cow or a bull to sire your dairy cows, pay no attention to the fancy points that the breeder talks about, some little point of off color in an animal or something of as little importance as that. You can buy a bull for a less price that has just those little things about him that only the breeder would notice, and get a better one than if you tried to buy only a fancy bull that is perfect in color.

I could go on and elaborate to you points that I believe are fancy points. For instance, we like to see what we call an open conformation of the ribs. You look at an animal, an individual that you know to be a good dairy animal, and then compare it with another animal you know is not, and you will see that they have a conformation of the bony structure of the body that is different from that of the beef animal.

The Udder

In all score cards of the different dairy breeds a great deal of attention is paid to the shape of the udder. That udder shall have what we call a "flat floor"; it should be attached well out under the cow's belly, and it should be from four to eight inches in front of the front teats. The teats should be wide apart each way and should be set squarely on the udder. But the principal thing you should be concerned about in considering the cow's udder is that she should have a good attachment to the body, because we believe that it gives a greater opportunity for the production of milk; and also for another reason, and that is, that it is not so likely to become what we call a pendulent udder. A pendulent udder is down in the way, down where it gets dirty and down where the cow is more likely to have her teats stepped on by other cows. In fact I have known one very valuable cow that finally destroyed all four quarters of her udder by stepping on it herself. That kind of an udder is never desirable. An udder should be well attached to the body. The fact as to whether it shall be placed squarely on the body is of very much less importance, but what you ought to think about is that the teats shall be of good size and that the cow shall be an easy milker.

Dairy Temperament

Nearly all score cards have something to say about disposition. You can tell of the disposition more by the expression of the cow's eye than by any other thing. When you come to look at her and to handle her, you will know at once whether you have a cow of desirable dairy temperament.

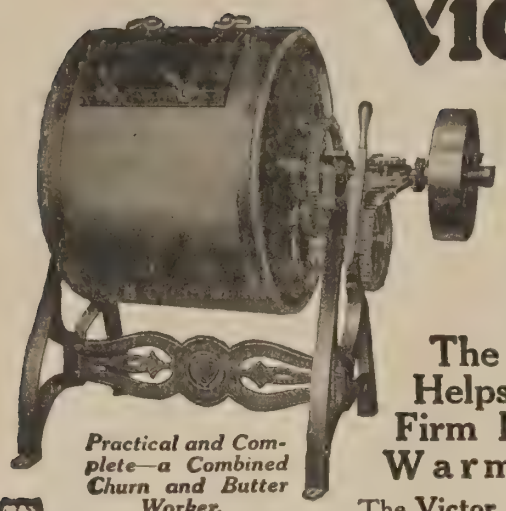
Now, when we used to talk of dairy temperament, we talked about nerve force and some people got the wrong idea, that we meant a nervous cow. We did not mean that at all. I do not believe there is any reason to say that a nervous cow will be a better producer than one of a quiet disposition. Indeed, I know that the opposite is true. I have in mind a herd of cows where there have always been two or three or four cows that were so nervous that if a stranger came into the stable those cows were all upset to the limit, and if a visitor stayed around the barn three or four hours, they would begin to scour and be good for nothing.

One of the other things that we, as breeders, think, from the fancy standpoint, is very desirable, is what we call a "straight rump" animal, an animal that carries out straight rather than sloping off, as some cows do. The theory is, as far as the breeder's standpoint is concerned, that the cow with an undesirable shaped udder is more apt to have with it a drooping rump, and that gives an inclination forward of the whole body. We want the cow moderately wide at the hips, about her thurls.

A cow has got to have large amounts of oxygen that she must breathe in from the air, in order to be able to oxygenize the blood and do the work she is expected to do. You will remember that the cow running out on the prairies is expected to give just milk enough to rear her calf, she is going to get no grain, she is going to have lots of exercise. We want to shut our animal up for a large part of the winter, we are going to feed her a large amount of concentrated food in the form of grain that Nature did not teach her to eat; we expect her to produce largely—anything we can get, and we have got up to 1,200 lbs. of butterfat from a certain animal. If we are going to expect that kind of thing, our cow must have ability to take in large amounts of fresh air, and so it seems necessary that she should have a large, wide, open nostril.

Then she should have a moderately long neck and she should be thin and sharp at the shoulders; she must not be round and heavy at the shoulders.

Do not make the mistake that this would apply always to the younger animals, particularly heifers that are



YANKEE DEKOL DE YONG COLANTHA, HOLSTEIN COW, CHAMPION MILK AND BUTTER PRODUCER OF NEBRASKA, OWNED BY NELSON BROS.

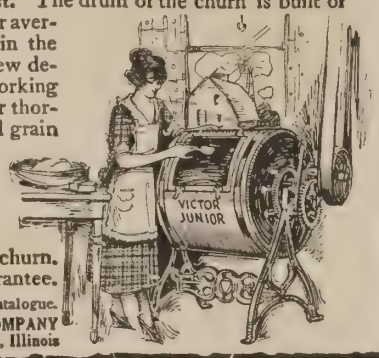
Freshening at the age of 7 years, she has recently completed a year's record of 24,704.6 lbs. milk containing 841.55 lbs. fat (1,051.94 lbs. butter on 80 per cent fat basis). In 305 days she produced 21,204.9 lbs. milk containing 726.97 lbs. fat; in 7 days, 644.5 lbs. milk containing 24.01 lbs. fat; and at 8 months after freshening, in 7 days, 430.1 lbs. milk containing 14.79 lbs. fat.

This cow has been a continual producer and has won near $100 as prize money from the cow testing association and from the Holstein-Friesian Association of America. As a two-year-old she made 15.4 lbs. fat in 7 days and, at 4 years, 22.62 lbs. fat in 683 lbs. milk, the state fat record at that time. At that time also she made the first Nebraska 24-hour production of 100 lbs. milk.

Nelson Bros. write: "Of course this cow received all the good feed we could supply, and she seemed to have the faculty to handle it, too. She averaged about 20 lbs. of grain per day throughout the entire year, with silage, alfalfa hay, and very little green grass. I think had she been on pasture her milk yield would have been much greater. Whether the fat yield would have been larger is a question. The last day she was on test she gave enough milk to feed nine calves—a mighty good nurse cow. She averaged over 67 lbs. of milk per day for the whole year."

Victor Jr. Churn

Practical and Complete—a Combined Churn and Butter Worker.



The Churn That Helps You to Make Firm Butter in the Warm Weather

The **Victor Junior** Churn puts butter making on the farm on a level with creamery butter making. It keeps the temperature down much better than the ordinary churn both during the churning and the butter working.

The mechanism of the churn is such that it will not only churn quickly but will get all of the butter. It also preserves the butter from dust and flies because when the churning is done, the butter can be salted and worked right in the churn. It does not have to be removed until finished.

To get the best butter, the temperature of cream for churning should be from 50° to 60° F. according to the density of the cream. A rich or dense cream requires a lower temperature than a thin cream. Having the cream at the right temperature to start with counts much in producing firm butter of good appearance.

The **Victor Jr.** will do the rest. The drum of the churn is built of heavy, well seasoned lumber. Under average conditions the temperature in the churn should not rise more than a few degrees during the churning and working process. The rolls work the butter thoroughly. It comes out with a good grain and firm.

We make and sell more churns for creamery use than all the other concerns combined so you can depend on our recommendation of the Victor Jr. as the ideal farm churn. It is covered with our iron clad Guarantee.

Full information in our Dairy Supply Catalogue.

Heider

The Real All-Purpose Tractor

12-20 and 9-16 H. P.

10 Years Actual Field Service

Ten Years of Big Successes

Steady, flexible power. The result of the Heider special friction transmission—one of the biggest successes in the tractor industry. No stripping of gears, no jerking of machinery—no loss of power turning needless parts. Low upkeep cost. Seven speeds, forward or reverse with **one** lever, without disconnecting the power.

going to have their first calves. After they are five or six months in calf, if they are in a condition that looks pretty wide there, it will not injure their qualities. I saw a cow last summer which has since milked down to a very, very spare form after being very round. Lillie Ella was so fat when she first came in, that most everybody, including her owner, thought she was nothing but a steer, and three months from that time she was right down to the spare dairy form.

As soon as a cow gets to milking, she wants to get away from anything that resembles the beef form where there is shown a pound of flesh on her used for any other purpose beyond sustaining her life vitality. It is true that cows closely housed and fed large amounts of grain, working on the Advanced Registry, do not become as spare as those working regularly in the dairy. One reason is those cows are allowed to become dry two or three months before they freshen, and then they are fed so much that they never get as thin as they normally would get.

Milk Veins

We used to talk about the milk vein, thinking that it carried the blood to the udder. Now we know that the circulation is the opposite way from the body, that it is down from the body into the udder and back to the heart. Now, milk is not much else but blood with the red corpuscles taken out of it. You will remember that if you had a cow that was ready to give twenty or thirty pounds of milk and you should cut the udder open you would find in that udder but very little milk. The bulk of the milk is elaborated during the process of milking. You have all noticed that you can milk out a cow's udder quickly and the milk stops coming. You wait a few minutes and it comes along all right.

The blood runs down through the body and goes up through holes in the body that we call "wells", and we like to see those large. Just the same, many cows do not have milk veins, and I don't know that we know as much about the function of milk veins as we ought to know in order to be able to talk intelligently on the subject. One thing, however, is quite certain, that many of the cows that have had great milk veins, we found that they were large because they had very small orifices for the blood to go back through the wall, and the veins were enlarged in size, because the circulation was not free. But it is true that nearly all good cows have large milk veins and, in judging cows, you want to pay attention to this vein that goes back along under the belly carrying the blood back to the heart. Sometimes the belly is covered with small veins. The longer they are, the crookeder they are, the more desirable we think them. Sometimes the best cows will have half a dozen wells that go through the stomach wall to carry the blood back to the heart.

The Quality of the Skin

A man in judging a cow will take and grab the hide just back of the shoulders. When that is done, we like to find that hide only moderately thick and especially loose on the body, so that it has a soft, pliable feeling, with a good condition of the hair. Of course the condition of the hide depends on the condition of the animal at the time, the condition of the individual cow, but you go along through a bunch of cows where they are all getting good care, and you will see a very marked difference in the character of the hide. We like the hide to be moderately thin and loose and soft feeling to the hand.

You can always tell an animal that is out of condition by its hide. And then it indicates the general thrift of the animal. Animals with hard, thick hides apparently do not properly assimilate their foods and are not doing well.

The cow with short legs is more or less of a nuisance, because her udder gets dirty. The great grandmother of Colantha 4th's Johanna was that kind of a cow; her teats came within four inches of the ground. That cow was shown about in 1882 or 1883 at the Wisconsin State Fair, when she was fresh in milk, and her udder almost dragged on the ground. A deep-bodied cow is all right, a cow with a deep body and large barrel, whether she is low down or up. I have one cow in my barn and every single young fellow that comes there picks her out as the best one, because he stands off and sees a very deep body with very much springing ribs, and he doesn't realize how low to the ground she is.

There are lots of things we don't know about. We go on and educate ourselves to make a cow look like something that we think she ought to look like, but just why those things come about we don't know. Just why we say that particular conformation is more beautiful than the other, I don't know. You go to an art gallery and you say, looking at a picture, that the artist hasn't any conception of what a cow ought to be, and he hasn't if you take one of our particular score cards and work out the picture by that; but the artist thinks he knows what a beautiful animal is, and he will go out into a field and pick out one that you and I think is the ugliest animal there. I have spent days in picture galleries, studying actual pictures there and I have found, in one instance, that the great Holland animal artist, Kyte, who painted in 1600 or 1700, certainly did one of the oneriest looking ewes that ever happened. According to these pictures beauty as considered by the artis

PART OF SHIPMENT OF 14 PURE-BRED JERSEYS TO BRAZILIAN GOVERNMENT FROM BROOKWOOD FARMS, NEW YORK

wouldn't have very much to do with dairy production.

I think we are going to get our ideas of dairy cows by looking at cows that we know have done the business rather than by trying to make cows do the business that look as we think they ought to look. Our American Guernsey Cattle Club endeavored several years ago, as some other clubs were doing, to make a chart drawn off in small rectangles and then photograph the cow against that, and then study out and endeavor to get, if we could, a correlation between the production of a cow and the conformation of that cow. The further we got into that proposition the bigger the subject looked and the harder to handle, until we have dropped it for the time being.—Abstracted from an address delivered at 1915 meeting of Wisconsin Dairymen's Association.

Price Fixing and Cost of Farm Products

(Continued from first page.)

tion; hence arises the question, Is either rule correct? If not, how can the correct principle be discovered? It is believed that the true solution of this problem lies in the substitution of total farm profits for specific costs as a basis of price regulation.

Joint Costs

The typical farm provides a much more difficult accounting problem than a sawmill, a flour mill, a cotton mill, or a steel mill. The problem is more nearly comparable to that in railway accounting, where one expenditure affects a great number of sources of income. The farmer who produces but one crop is rare. On the typical dairy farm, corn, small grain, clover hay, and pasture, cattle, horses, and hogs are all produced. The same plows, harrows, and horses are used for the various crops which require attention at different seasons and the same laborers are used for crops and live stock. When the corn is being cultivated the corn is not only benefited but the land is being put into condition for the small grain crop which will be grown the next year. When the land is prepared for small grain the seed bed for the clover is being prepared, and oats or barley serves as a nurse crop for the clover plant which in turn is able to draw upon the nitrogen of the air and provide plant food needed for its own growth and for the corn crop which is to follow. Hence the costs of these crops are said to be joint costs.

Under these circumstances, suppose it is found that the oat crop costs more than the market price, that the cost of oats is ten cents greater than the price. What can the farmer do about it? He can do a little figuring to see whether or not another crop which requires his attention at the same periods and which serves equally well as a nurse crop, barley for example, can be substituted with a profit or with a smaller loss. If not, should the farmer cut out the small grain crop? Usually not. The total cost of man and horse labor would be reduced little by omitting the oat crop because oats and corn require labor at different seasons and are supplementary to each other. If this crop were not grown the hours of productive labor would probably be reduced and the average charge per hour for labor applied to the corn would be greater.

But this is not all. Oats are used as a nurse crop for clover and while it may be possible to grow clover without a nurse crop, this would cost nearly as much as putting in the oats. Hence the growing of small grain is usually the cheapest way to get a seeding of clover and where clover thrives this is the best way to secure nitrogen for the corn crop. Thus it is the joint results of the joint costs which are important.

Having adopted the system of farming, the parts of it should be adhered to so long as the system as a whole continues to be attractive, and so long as each part of the system continues to pay better than the substitute which is competing for a place in the system.

The corn, oats, and clover combination is not a complete system of farming in itself. It is usually combined with one or more live stock enterprises. Beef cattle and hogs, dairy cattle and hogs, or straight dairying may be combined with this cropping system. In each of these systems there are many instances of joint costs. The joint cost of fattening steers and hogs is commonly understood among feeders. Where butterfat and pigs and veal calves are the products sold, these three products have elements of joint cost. Where pure-bred cattle and milk are sold the costs are joint and inseparable; the important question relates to the profit of the system as a whole.

Where grade cows are purchased and used for the production of city milk we approach more nearly to a specific cost of a specific product as far as the live stock industry is concerned, with only a small by-product in the form of a veal calf. And yet this type of dairying has its costs intermixed with the system of cropping, notably in the use of labor, the use of crops, and the provision of fertilizer. Hence, in mixed farming, joint costs are present to block the effort to arrive at the cost of producing any specific farm product.

Where two articles are produced as a result of the same work the combined prices of the two tend to equal the greatest necessary cost of producing them, but the price of each article is determined separately on the basis of supply and demand.

Consumers want a variety of things produced by the farmer. How much a consumer will pay for a given article depends upon the intensity of his desire for it. The intensity of his desire depends upon how abundantly he has been supplied. The more he takes the less he will pay for any given unit of the goods. Unfortunately, under conditions of joint costs there are certain physical facts which determine the ratios in which goods are produced, without much regard to the ratios of the intensity of the desire for them. As a result the supply demand price of one product may be higher and that of another lower than the cost, but the combination of crops may prove profitable. The case is similar to the situation in the oil business. Gasoline and kerosene have a joint cost; and it is the condition of the market and the relative proportion in which they are obtainable at a common cost which makes the price of gasoline nearly twice as high as that of kerosene at the present time.

Total Farm Profits and Price Regulation

When the point of view of total farm profits is accepted by the price commissioner, the problem becomes that of so regulating prices that the farmer in one line of production may reap as large a reward as he could earn producing some other product, or else of helping him in getting into some other line of production. By looking to total farm profits he avoids many of the difficulties arising out of differences in the cost of producing a given article by different men. Even if it costs one man 2 cents a quart to produce milk, another 3 cents, another 4 cents, and still another 5 cents a quart in a given city milk belt, yet each of these men may be doing the type of farming which pays him best and the industry may be stable so long as relative prices re-

National Dairy Show, Columbus, Ohio, Oct. 10—19. Manager, W. E. Skinner, 130 N. Wells St., Chicago, Ill.

Wisconsin Breeders at Barron

The Wisconsin Live Stock Breeders' Association will hold its next meeting at Barron on August 10. Afternoon and evening programs will be given. Mr. Fred W. Hoxie, secretary of the Barron County Holstein Breeders' Association writes us: "Special emphasis will be placed on dairying and the uses of milk, as Barron and the surrounding countries are greatly interested in the production of milk and milk products. Barron County will be glad to welcome people from all parts of the state and special effort will be made to have the occasion an enjoyable one to all."

Dairying in Australasia

HOARD'S DAIRYMAN:—Some are contending that the big consignments of butter cleared from Australian stores for the Imperial Government have left local scarcity. During the first three months of this year butter to the value of £3,000,000 was removed, as compared to £2,216,000 in the corresponding period of last year. But the government controlling export had in mind the favorable character of the season which saw endless feed in the autumn to carry over the winter months. Whether the prophesied scarcity will materialize or not, the fact remains that prices have not risen much, though in New Zealand the retail rate has been put up by 4 cents per pound, making the rate 40 cents against Australia's 36 cents.

⚜

A federal commissioner has been investigating the allegation that there is in existence in Australia a condensed milk combine. He found that there was a compact between companies to abstain from competition and that the Nesle Company was not to charge more for its sweetened milk, condensed milk, than 61 cents per case above the lowest price for any other brand. There is an agitation for an all-round increase in condensed milk and it is believed that the commissioner in charge of the price-fixing department will consent to another two cents per pound.

⚜

The Australian government has again closed with the British government for the whole of the coming season's output of butter. Dairymen evinced a desire not to follow the example of New Zealand and ask for $42.58 a hundredweight but agreed to be content with last year's price of $36.74 f. o. b. The quantity taken last year amounted to thirty thousand tons and it is expected that this year the figures will be passed as the season promises well. Fearing a shortage last year the government had half a mind to put Australia on a butter ration as it was represented to them that the British government placed butter first in foods sent from Australia and they were then in urgent need of it. However, the season turned out well and there was no reason for the ration.

Australia. J. S. DUNNET.

Early Plowing for Wheat

Early plowing returns a yield of from 3 to 10 bushels more wheat per acre than late plowing. Figuring this increase at present wheat prices it means at least $6 to $20 more per acre for the land. Early plowing for wheat puts soil in shape to absorb every shower, makes a firm, moist seed bed and keeps the weeds down so that moisture and available plant food can accumulate in sufficient quantity to give the wheat a quick, vigorous start when planted. The University of Missouri College of Agriculture recommends that the plowed land be worked down as soon as possible. The practice of dragging or harrowing land within a half day or day after it is plowed saves labor and gives better results. Weeds should be kept down after plowing since they use much water and plant food. A well prepared seed bed will undoubtedly add bushels to the wheat field.

Early plowing buries the Hessian fly, conserves moisture, and makes a good seed bed for wheat. The ground should be plowed or disced as soon as possible after harvest. Discing and then plowing is often advisable because then the plowing is much easier. Discing also destroys the Hessian fly and exposes the flaxseed stage of the pest to the hot sun and the attack of insect enemies.

Volunteer wheat and weeds may be kept down by cultivating the plowed ground after rains. The main food supply of the Hessian fly is wheat, and if the volunteer wheat is destroyed the fly will starve. A better seed bed is also made by numerous cultivations of the plowed ground.

The Hessian fly is well under control now as a result of last year's fight against it, according to T. J. Talbert of the University of Missouri College of Agriculture, and if the farmers take special pains to plow early again this year the fly will be unable to do any material damage to next year's wheat crop.

CREAMERY ON LONG BEACH FARMS, MICHIGAN, 14 FT. BY 20 FT., AND FULLY EQUIPPED

Both an upright steam and a gasoline engine can be used for power. They furnish power for the milking machine. In the background two driveways to the barn are shown; one, built so that it will shelter a wagon which is drawn under it, and the other built in to cover a root cellar opening into the barn.

New York Butter Market

NEW YORK CITY, JULY 30:—Quotations on butter, much to the surprise of all dealers, have undergone practically no change for a week. In spite of that fact the market has been decidedly weak. Large quantities of butter continue to be stored up in local warehouses and private boxes and distributing trade is very quiet. The factors which tend to sustain the present high quotations are the dry weather in the Middle West and the universal rapid shrinkage in make. Because of the hot wave throughout the dairy sections of the country the quality of the butter received continues to be much below normal. That, too, has a tendency to sustain the present prices of butter, especially of the higher grades.

It does not seem reasonable with the accumulations of stocks growing larger and larger that the present prices can prevail for any considerable time. Unless something happens to clear out the accumulations prices must fall. It would be contrary to the law of suply and demand if they did not. To be sure, the army and our allies are using varying quantities of butter and it may be that through those agencies the present prices may be maintained. With the passing of one more week the situation should be cleared up to a considerable extent.

Today's quotations are as follows: Extras (92 score), 44¾@45c; higher scoring than extras (93 score or above), 45¼@46c; firsts (88 to 91 score), 43½@44½c; and seconds, (83 to 87 score), 41½@43c.

New York. W. B. LIVERANCE.

Regarding Threshing Prices

Regarding prices charged for grain threshing this season, the U. S. Food Administration emphasizes that its chief interest in threshing operations is the conservation of cereal grains by efficient operation of threshing machines. The Food Administration has not fixed nor has it authority to fix prices which threshermen shall charge for their services.

It has suggested, however, that the county threshing committees now organized throughout the country hold meetings at which both threshermen and farmers are represented. Acting merely in an advisory capacity these committees have assisted in formulating fair charges based on local methods and conditions. Lack of uniformity in threshing operations makes the establishment of any single price over a large territory impracticable and unjust. In some areas threshing from the stack is the customary practice, while in others the grain is hauled directly from the shock to the threshing machine. Sometimes the thresherman furnishes the entire crew, but more often farmers supply the majority of men. The kind of grain to be threshed, local labor conditions, and meals for the threshing crew are other considerations.

It is believed that the county threshing committees are in the best position to act as voluntary tribunals in arriving at threshing charges satisfactory to all concerned. A large number of threshing committees have already acted as intermediaries between threshermen and farmers, with encouraging results.

Receipts of cheese during the week ending July 27 were as follows: Chicago, 1,862,370 lbs.; New York, 1,524,893 lbs.; Boston, 433,837 lbs.; Philadelphia, 703,190 lbs. Wisconsin supplied 90 per cent of the cheese on the Chicago market.

9 Units Sold up to 1907.
36,000 Units Sold up to 1918.

The Correct
Milking Machine Principle

The success of the milking machine as a labor-saving and profit-making dairy equipment has been due largely to the correct principle of the HINMAN Milking Machine.

The early prejudice against the milking machine was natural because of the many unsuccessful experiments with complicated mechanisms. The simple operation of the HINMAN, more than anything else, has helped to overcome prejudice against using a machine on a live animal.

The HINMAN principle has never been changed from the original machine. Over 10 years' experience in perfecting details has resulted in absolute justification of the machine.

To work well, a machine must be simple—simple in construction and simple in operation.

HINMAN MILKER

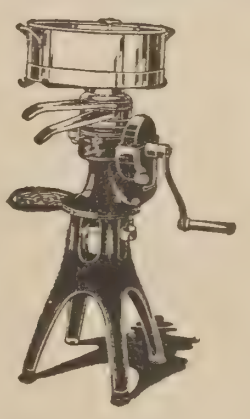
Proven by 10 Years' Success

This single-unit machine milks easier, milks cleaner, permits changing pails without stopping milking, and keeps each cow's milk separate to weigh out the slackers.

Simplicity Means Low Cost

There are no expensive pipe lines, air tank or complicated pulsating mechanism. Simple combination of vacuum pump (pressure of which can not exceed 15 lbs.) valve chamber in pail cover that cannot wear out, and natural-action teat cups that soothe the cow.
One man with 3 units can milk 18 to 25 cows in an hour. The outfit costs about $225 installed.

Big Catalog FREE



If you milk six cows or more, send for this book. Read about the experience of successful dairymen in the leading dairy sections of the world. It tells why more HINMAN Milkers are in use than all other makes combined. Ask about our free service which guarantees satisfaction.

Hinman Milking Machine Co.,
71-81 Elizabeth St., Oneida, N. Y.
Some territory open for live agents.

Lily and Primrose

NEVER buy a cream separator in a hurry. Your reason for buying is not so much to get a cream separator, as *to get all the cream from your milk, all the time.* It takes time to pick that kind of a machine out of the many on the market.

Send to reputable firms for catalogues, and study them carefully. See which machine requires the fewest and simplest adjustments; which has the best oiling system; which is most sanitary and most easily cleaned; which is so well made that it will undoubtedly do good work for a long time. Go into details, and pick the best two or three of the lot.

Then ask for skimming demonstrations to determine how little cream is left in the skim milk. This is important, because the wrong machine can waste more cream than it is worth, while the right one will put money in your pocket every time you use it.

When you are through you will find that you have bought a **Lily** or a **Primrose Cream Separator** because the **Lily** and **Primrose** will prove to be first on all these counts. We will send catalogues on request, leaving the final decision to your judgment.

EDITORIAL COMMENT

BOUNTIFUL crops have come to us when we were in need of them. It should be a source of deep satisfaction to us all to read the reports of large yields of wheat, rye, oats, and barley and the promise of a bumper corn crop. The only crop which is short in our country is hay, but with a good corn crop and the silo this can be met without hardship.

CHICKENS CAN PICK UP REST

A group of farmers gathered in front of a hall, where a meeting was to be held, and fell to discussing the rules of threshing as outlined by the U. S. Food Administration. It was understood by these men that the rules simply required the thresherman to do a good job of threshing and to clean up thoroughly after each setting.

"Well," said one of the farmers, "we have never wasted any grain in our neighborhood. We have always been very careful. One of my neighbors was so anxious last year to get all the grain that he ran through the separator about six inches of soil all around and under the machine. After this thorough cleaning up he said: 'Well, boys, never mind what's left, the chickens can pick up the rest'."

MILK LEAFLETS

The U. S. Food Administration issued, some months ago, a four-leaf pamphlet setting forth the importance and food value of milk. About two million copies of this leaflet have been distributed by the U. S. Food Administration and the U. S. Department of Agriculture. This leaflet should be in the hands of every consumer, but the appropriations to these Departments are limited and they have not the funds to print the required number to reach every home.

The U. S. Department of Agriculture is in position to furnish these pamphlets in quantities to dealers, associations, or commercial organizations for the sum of $1.13 per thousand delivered to any address in the United States. Make checks payable to the American Security and Trust Company, Treasurer, (who is handling the funds under this joint arrangement) and mail checks together with order for leaflets to the U. S. Department of Agriculture, Attention Alexander H. Kerr, Special Assistant, Washington, D. C.

We can fully recommend this leaflet and would urge that milk distributors especially avail themselves of this liberal offer. Every school should order enough of these leaflets to give one to every student capable of understanding it. It could profitably serve as a lesson in all classes from the fifth grade up.

FEED LIBERALLY NOW

This is a season for liberal feeding. At no time in the year will cows make larger returns for a plentiful ration than now. What the herd receives at this time largely influences the whole year's production. Not only is the milk flow immediately increased when grain and other feeds are supplied during the period of short pasturage but vitality is maintained, cows are carried to winter quarters in good strength, and production is kept up. He is a man of wisdom who feeds now rather than allowing cows to decline in flesh and milk and then later expending high cost feed in a vain effort to bring the herd back to a liberal milk flow.

V. C. Manhart, tester in an Indiana association, gives pointed proof demonstrating the value of supplementing short pasturage with feed. He says in reporting for the various herds on which he keeps records: "One herd during the month of June only produced 61 per cent of the amount of butterfat they produced in May when fed (grain). One cow when fed six pounds of grain per day increased her milk production from 1,080 lbs. per month to 1,491 lbs., and her butterfat from 27.3 lbs. to 41.7 lbs.

BARLEY AS A STOCK FEED

You may think you know a good deal about barley but let us say that a reading of Farmers' Bulletin 965, on the "Cultivation and Utilization of Barley", by the United States Department of Agriculture, will take that conceit out of you. When read, you will wonder at the amount of information there is contained in this modest volume. Dairy farmers are particularly interested in growing a grain of a high feeding value for cows, calves, and hogs. Let us quote from this bulletin as follows:

"On the Pacific slope where corn or oats do not flourish in equal degree, barley is extensively used as a feed for animals. The horses of California are quite generally fed on rolled barley with wheat, oat, or barley hay for roughage. Barley is the common feed for dairy cows in Northern Europe. The Danes sow barley and oats together in the proportion of one peck of barley to two of oats, the ground mixed grain from this crop being regarded as the best available for cows and other stock. For horses barley is somewhat less valuable than oats. At the Virginia Station calves made excellent gains on barley and skimmilk but corn proved cheaper. In Great Britain and Northern Europe barley takes the place of corn for pig feeding, leading all grains in producing pork of fine quality."

COTTAGE CHEESE RECIPES

The Gridley Dairy Co., Milwaukee, Wis., has issued a pamphlet containing 100 cottage cheese recipes. Some of the recipes were obtained by offering prizes for various dishes made from cottage cheese. This brought to light many recipes not generally known. The pamphlet is distributed free to the patrons of the Gridley Dairy Co. and will be sent to any address in the United States for ten cents a copy.

Too few people have appreciated the food value of cottage cheese and the number of toothsome dishes that may be made from it. Millions of pounds of cottage cheese will be made when the housewife will use a few pounds each week. The manufacture of this cheese is simple, but if there is little demand it is not to be expected that it will come to the market in large quantities. Every effort should be made by milk dealers to teach their customers the food value of cottage cheese, for it is in this way more of this product will be consumed.

The U. S. Department of Agriculture reports a big increase in the consumption of cottage cheese. It says:

"Reports from four western cities where cottage cheese campaigns have recently been completed show largely increased sales of this wholesome meat substitute. The following increased daily sales are recorded: Salt Lake City, Utah, from 375 to 850 pounds; Spokane, Wash., from 100 to 1,800 pounds; Seattle, Wash., from 1,115 to 1,675 pounds; San Francisco, Cal., from 393.5 to 1,624 pounds; or a total increase of 3,969 pounds of cottage cheese sold daily in the four cities.

"This is the result of 10-day campaigns in each city in which the food value of cottage cheese and its use in new dishes was demonstrated by a woman agent in dairying and in which the creameries and milk plants were assisted in making cheese by two representatives from the United States Department of Agriculture and the state agricultural college."

This shows what systematic demonstrations and advertising will accomplish.

YOUNG MEN TO SCHOOL

The call of our country is appealing strongly to our young men. It is ever urging them to offer themselves to the service of Uncle Sam. We commend their spirit and their willingness to offer their all to their country. But we must not forget that this country has other duties than the big job over the seas. We of course must win the war, but in doing this task we must not neglect to prepare for peace and all the complicated problems that will come with it. The war is bringing many changes, some of which will last, while others will disappear as soon as it closes.

Our government sees the necessity of continuing our schools so that we can prepare our young men to meet their duties intelligently. Both President Wilson and Secretary Baker urge that education during the war be not neglected for the more active duties of war. Philander P. Claxton, United States Commissioner of Education, says, in an open letter, that we must not make the mistakes which England and France made during the early years of the war by closing both their secondary schools and colleges. He states further:

"America must come to the rescue. We must be ready to assume all the responsibility and perform thoroughly and well all the duties that will come to us in the new and more closely related world which will rise out of the ruins of the old world now passing away in the destruction of the war. To what extent and how well we may be able to do this will depend upon you young men and women who are this year graduating from our high schools and upon those who will follow in the next few years, to a larger degree than upon any other like number of people.

"Therefore, I appeal to you as you love your country and mankind that you make full use of every opportunity offered by our colleges and other institutions to gain all possible preparation for the mighty tasks that lie before you, possibly in war and certainly in peace. To you comes that call clear and strong as it has seldom come to young men and women anywhere in the world at any time. For your country and for the world—for the immediate and the far-reaching future, you should respond."

Young men under the selective draft age should consider this appeal and put forth every effort to meet it. Not only our country but the whole world is going to need trained minds to guide its destinies.

CLOVER AND ACID

Much of the clover killed out last winter in all parts of the country, but some fields escaped and produced large crops of hay. We have observed unusually heavy fields of clover close to fields where the clover was killed. These fields were subjected to the same rain and snow falls and to the same freezing and thawing. On adjoining farms one field of clover lived and the other died. Why?

Plants like animals feed and like animals, too, they must be provided with environments in keeping with their natures. Domestic animals require protection from the rigors of winter and so do some plants. It is impractical to house all plants as we do our animals, but it is possible to provide for them an environment which will protect them from death.

In growing both clover and alfalfa it is necessary to have the soil in good physical condition; well drained, full of plant food, and sweet. When plants are properly fed and given the right kind of an environment they grow strong and are capable of resisting severe winters. Clover winter-kills, at times, on soils in good physical condition and in a high state of fertility, but run-down soils, especially if acid, are uncertain in the production of clover.

In bulletin No. 213 of the Indiana Experiment Station, the following summary is made concerning the value of lime for growing clover:

Clover will not thrive on acid soils.

Liming is the only practical means of correcting soil acidity.

Three-fourths of the soils of Indiana are acid and in need of liming.

About one-fourth of our soils is so very acid that clover fails almost every time it is sown.

About one-half of our soils is of slight to medium acidity and clover will fail whenever the weather conditions are at all unfavorable.

Only about one-fourth of the soils of Indiana is well enough supplied with lime to enable clover to develop properly.

A liberal application of pulverized limestone or some other form of lime is needed to insure a clover crop on any acid soil.

Wherever clover fails to thrive, the soil should be tested for acidity.

If the soil is acid enough to need liming at all, at least two tons per acre of ground limestone or its equivalent in other forms of lime should be applied.

Ground limestone may be applied at any time, but the best plan is to apply it on plowed ground and disk it into the surface soil.

Lime will often produce immediate increases in grain and other crops, but the greatest benefit derived from it comes through increasing clover and other legumes in the rotation.

Following a good clover crop, it is possible to grow good grain or other crops.

The greater the proportion of legumes that can be turned under, either directly or in the form of manure, the easier it will be to maintain the fertility of the soil.

Lime is not a fertilizer. Manure or fertilizer, or both, should be used in addition to lime.

On seven experiment fields in different parts of the state, ground limestone has produced crop increases worth from $10.50 to $67.70 per acre per rotation of corn, wheat, and clover. The average net profit has been $6.78 per acre per year, and $2.68 per dollar invested.

Fence Jumping

Give me some way to keep some young Holstein heifers from jumping good wire fences.

Goshen, Ala. J. M. M.

A good many years ago a common difficulty in the sections which are now highly developed in dairy farming was that which is here mentioned.

Hoard's Dairyman was commonly asked to recommend measures which would keep cattle from jumping fences. Within recent years, however, this difficulty has been slight. The reason for this is that cattle are better fed these days; they are treated well and kept gentle. They have no reason for jumping fences; they are supplied enough feed within their own confines that there is no reason for seeking other pasturage. It has taken a good while for dairy farmers to improve their methods of management so that their cattle are cared for well enough that they do not give trouble in jumping fences.

We wonder if the difficulty of this correspondent arises from the same source. Are these heifers well fed and well cared for at home? If they are and are still persistent fence jumpers, unless they are highly valuable animals, the easiest way out is to dispose of them. A yoke can be fastened on them; they may be haltered and their heads tied to their front feet; a chain and pole may be tied to their halter or any one of several measures which have been recommended may be adopted, but such animals are nuisances and not worth keeping unless they are extremely valuable for breeding purposes.

Highest Record Animals—In Production and Price

Please give the names of the highest producing Holstein, Guernsey, and Brown Swiss cows together with their records and the names of their owners.

Will you also quote me a few record prices paid for dairy sires and dams?

Wisconsin. L. E. P.

The following is the list of the cows in the five leading dairy breeds which have the largest yearly fat records for their breed:

Breed	Name	Milk, lbs.	Fat, lbs.	Owner
Jersey	Sophie 19th of Hood Farm	17,557.8	999	Hood Farm, Massachusetts
Guernsey	Murne Cowan	24,008	1,098	O. C. Barber, Ohio
Holstein	Duchess Skylark Ormsby	27,761	1,205	J. B. Irwin, Minnesota
Ayrshire	Lily of Willowmoor	22,590	955.56	J. W. Clise, Washington
Brown Swiss	College Bravura 2d	19,460.6	798.16	Michigan Agr'l. College

The highest price ever paid for a dairy animal was recently paid for the Holstein bull calf, Champion Sylvia Johanna, formerly owned by A. C. Hardie, Canada, and sold at the 1918 National Holstein sale at Milwaukee to Carnation Stock Farm, Washington, for $106,000. The highest priced Holstein cow ever sold is Wandemere Belle Hengerveld which was sold at the 1917 National Holstein sale for $18,300 by Leroy Pelletier, Michigan, to Shanahan & Dodd Brothers, New York.

The highest priced Jersey bull which has been sold was Golden Ferns Noble which in 1916 was imported for Mr. Proctor of New York and for which he paid a sum of $25,000. The highest price of which we have record for a Jersey cow is $10,099, which was paid for Sophie's Agnes at the 1918 Hood Farm auction sale. Ayredale Stock Farm, Maine, was the purchaser.

W. G. Jamison and Sons, Wisconsin, recently sold the Guernsey bull, Pencoyd's Golden May Secret, to Edgemoor Farm, California, for the sum of $10,100, the highest price yet paid for a Guernsey bull. At the Langwater Farms (Massachusetts) auction in 1916, Langwater Dairymaid was sold to C. L. A. Whitney, New York, for the sum of $6,150, the highest price yet paid for a Guernsey cow.

Penshurst Farm, Pennsylvania, sold the Ayrshire bull, Penshurst Mischief Maker to Froh Heim Farms, New Jersey, for $6,000 in 1916, the highest price which has been paid for an Ayrshire bull. At the recent Ayrshire consignment sale in Connecticut, South Farm, Ohio, set a new record for Ayrshire cows by selling Pansy's Daughter of South Farm to C. S. Mawhinney, New York, for $4,200.

Sow Thistles

I write you to find out how to get rid of sow thistles. They blossom yellow. They grow all one leaf and above the leaves there's a stem where the flowers grow. There will nothing else grow.

Hayton, Wis. N. S.

In general there are two kinds of sow thistles, annual and perennial. The annual thistle has a pale, yellow flower from one-half to one inch in diameter. The roots are fibrous. It is spread by seeds distributed by the wind and is especially troublesome in cultivated lands where it is difficult to suppress because of its ease of distribution. It can be eradicated by preventing it from seeding in waste places from which the seed is blown into cultivated fields. These places should be cleaned up and seeded to permanent, vigorous grasses which will choke out the thistle. The plant is destroyed if during any one season every single plant can be kept down so that there is no seed produced. Annual varieties of sow thistle are relatively easy to eradicate.

Perennial sow thistles are very difficult to completely clean out of a field in which they have gained much headway. They are distinguished from the annual plant by having bright yellow flowers about 1½ inches across. They are somewhat more vigorous in growth, attaining a stem height of one to five feet, while the annual plant seldom reaches a height of four feet. The perennial stem is hollow, has few leaves, and is branching at the top. The plant is deep-rooted and is propagated both by seed and by large and very vigorous running rootstalks. The most positive differentiation between the two general types of thistles is in the root system, the annual thistle having a simple fibrous root while the perennial plant has running rootstalks.

The perennial sow thistle is one of the most aggressive weeds. It causes great loss in reducing crop yields and is a dangerous weed because of the extreme difficulty in eradicating it. In some sections it is the worst of all weed pests, rendering in many instances whole fields unfit for crop production. In grain, if left undisturbed, the seeds of the perennial thistle ripen before the grain is cut and are carried long distances by the wind. The seed is sometimes carried to new ground in clover and other small seeds.

The fight against this vigorous aggressive pest should be begun as soon as it is discovered and continued vigorously until it is completely eradicated. It will continue indefinitely unless extreme measures are taken and continued throughout the season and from season to season. Make certain that no plant matures either in fields or in waste places so that its seeds are distributed. Small patches of the pest can be cleaned up if all of the roots can be dug from the ground and destroyed. This should be done several times during the season. Fields in which the weed occurs should not be cultivated with implements which will drag pieces of the roots over the fields, as every small piece of the root which is carried to a new part of the field may propagate the weed there. If the weed is started generally over a field, close attention must be given through the season and for a number of years before it can be made certain that the eradication is completed.

A treatment which is recommended as being most effective is to plow lightly just after the hay or grain crop is removed and follow this with frequent cultivation with a broad-shared cultivator. Later in the season the field should be plowed again, this time somewhat deeper. The following spring frequent cultivation should be continued in order to prevent the development of any leaves and to weaken the roots as much as possible. By the middle of June or the first of July rape or any other heavy leaf plant should be sowed in drills rather heavily. Between the drills the ground should be cultivated at short intervals until the ground is completely shaded by the rape. Hand hoeing is better than the use of horse drawn implements. If some plants remain even after this treatment when the rape is cut or pastured off, the field should be fall plowed and put into a hoed crop for the next year, special attention being given to any small patches that may appear. If the field is badly infested at the start, it may be necessary to fall plow after the use of such a crop as rape or buckwheat and continue surface cultivation until late in the fall and spring when such a crop as oats or barley can be sowed to be cut green for feed. After this crop is taken from the field care should be given that no single plants of the thistle are allowed to grow.

This recommendation necessitates a rather strenuous program but if the thistles are of the perennial variety, easily distinguished by careful examination of the roots, it is necessary that immediate and close attention should be given to it, else, by its spreading, it will cause very great loss, both in immediate loss in crop production and in the end in lessened sale value of the land.

Slough Hay for Silage

We are considering building a silo and to fill it with slough hay. This hay is more like prairie wild hay than it is the regular hay that we sometimes get in the swamps, as we have here some of the Blue Joint. Will you kindly give me your advice whether this would make silage or not and, if so, what size of silo would you recommend to build for an experiment? What is the smallest you would consider a profitable one to build?

Creston, B. C. C. O. R.

We are in doubt as to the desirability of building a silo for taking care of the slough grass. There is nothing about the ensiling process which will improve the quality of this feed, but, if it makes good dairy cow feed when green and it is not practical to use it for hay or to have a better silage crop, it might be desirable to use this for succulent feed for cows during the winter months. Weeds, grass, thistles, sunflowers, and many other crops have been ensiled, but we question whether these will furnish the cow with a wholly desirable forage. It is more than likely that in most cases they were ensiled with a good feeding crop and do not detract from its value.

We would not suggest building a silo smaller than 10 feet in diameter and 25 to 30 feet in height. A pit 8 or 10 feet deep and 10 feet in diameter might be built to try out the crop of slough grass. If this proves successful or if decided later to use the silo for other crops, this height could be increased by building the silo above ground.

"Hollow Horn"—Charbon

I wish you would republish a piece that appeared in your columns some months ago on "hollow horn" and "wolf in the tail". Most of these people here believe strong in that, in fact, that is about the first aid to a sick animal.

Can you give any information on what charbon is and its remedy?

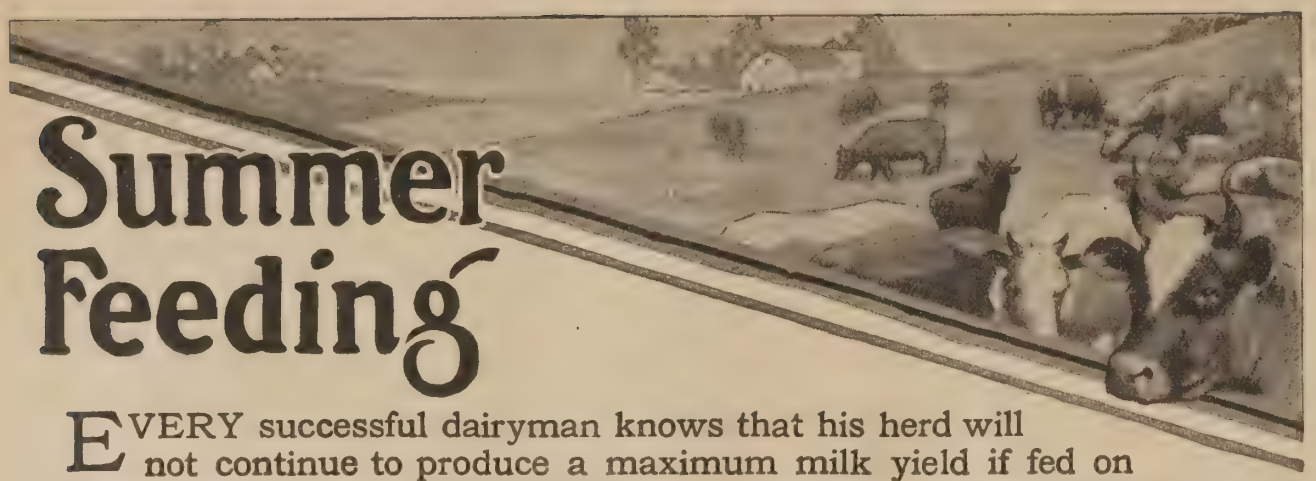
Selma, Ala. W. J. E.

The following statement was published in 1916 in Hoard's Dairyman in reply to an inquiry concerning "hollow horn" and "wolf in the tail".

"These diseases are entirely mythical and exist only in the minds or imagination of the ignorant. They date back to the dark ages of barbarism when harmless old women were burned as witches and belief in them is on a par with that in the signs of the Zodiac which have no appreciable or important influence upon mundane affairs or those on the farm. The horns of all adult cattle are hollow. Alleged "hollow horn" commonly is hollow belly from lack of feed. The soft place in the tail is due to pulling apart of the coccygeal vertebrae and ligaments when the cow has caught the brush of her tail on a snag or fence and yanked it loose."

Charbon is the French name for anthrax and is a term sometimes used to describe the disease in southern states. It is not used in the North. The disease is malignant, contagious, incurable, caused by a bacillus, and is communicable to man as well as cattle and other animals. Blood flows from the natural openings of the body after death. Attacks are characterized by high fever and occurrences of swellings which do not crack when handled as do the swellings of blackleg. The disease may successfully be vaccinated against by the trained veterinarian.

A Ration



Kindly balance a ration of ground oats, gluten, and cottonseed meal or state other grains necessary.

Barberton, Ohio. W. S.

The most economical basis for a dairy ration is a liberal supply of the right kind of roughages. The first concern in feeding dairy cows should be that they receive during the winter season all of a legume hay, such as clover or alfalfa, that they will eat. Even at last winter's high prices the nutrients in these feeds were very much cheaper than those purchased in concentrates.

In addition to such a hay, cows will pay high prices for corn silage supplied at about the rate of thirty pounds per cow for the average cow. With these two feeds a splendid basis for economical production is had and a concentrate mixture in addition to this to the heaviest milkers should give splendid returns in profits.

The three feeds listed, if made up in a combination, would be disproportionately high in protein. If a high carbohydrate concentrate such as corn meal, hominy, or a commercial feed mixture such as Schumacher Feed can be included, the ration will be more suitable to milk production. We recommend a mixture of 400 lbs. of a high carbohydrate concentrate such as corn, 300 lbs. ground oats, 200 lbs. gluten, and 100 lbs. cottonseed meal; this mixture to be fed to the heaviest milking cows in addition to the roughage at the rate of one pound for each 3 to 3½ pounds of high testing milk produced or at the rate of one pound for each 3½ to 4 pounds of low testing milk produced.

Summer Feeding

EVERY successful dairyman knows that his herd will not continue to produce a maximum milk yield if fed on grass alone. That is why thousands of prosperous feeders all over the country who know how to feed for results, are using Krause Dairy Feed, twelve months in the year—are depending upon it for a large part of their summer as well as their winter rationing.

Krause Dairy Feed

Krause Dairy Feed is an exceptional all-year-round feed because it is composed of nine of the best milk producing feed stuffs on the market, carefully and scientifically proportioned to secure a balanced ration containing a protein content of 24% to 25%. It contains Distillers Grains, Gluten Feed, Cotton Seed Meal, Wheat Bran, Malt Sprouts, Wheat Middlings, Brewers Grains, Hominy Feed, Linseed Meal and a small percentage of salt.

Fed alone or mixed with home grown grains when a lower protein content is desired, Krause Dairy Feed can always be depended upon for a high grade milk making ration which never varies in quality. Each ingredient in it is valuable in itself and its value increased by the variety of other materials with which it is combined. Krause Dairy Feed is more than a balanced ration; it is a standardized ration that can be adapted to meet the feeding requirements of any section of the country in which it is used.

No shrewd business farmer is spending the time to mix his own feed when he can secure a ready mixed ration like Krause Dairy Feed that is chemically correct, and has been proved by thousands of expert dairymen to be economical, profitable and dependable.

A fair trial of Krause Dairy Feed will convince you that your herd will thrive on it, increase its milk yield and pay big returns on the investment. Order Krause Dairy Feed from your dealer today. If he cannot supply you immediately, give us his name and we will see that you get it without delay.

TRADE BADGER MARK

Watson Ayrshire Secretary

The Board of Directors of the Ayrshire Breeders' Association have elected James G. Watson secretary and treasurer of the association, as successor to the late C. M. Winslow.

Mr. Watson is admirably fitted for his new duties. He is a native of Scotland and knows Ayrshires in their land of origin and in their adopted home in America. He is a graduate of the Iowa State College and served Iowa and Missouri as extension dairyman. As manager of the Southwestern Dairy Show in 1916, he was responsible for the success of the undertaking. Since October, 1916, he has had charge of the extension activities of the Ayrshire Association.

JAMES G. WATSON

No one is better qualified to direct association work for Ayrshires. He has a wide acquaintance among the breeders in all sections of the country and is thoroughly informed concerning the red and white breed. His capabilities make him a valuable man to the Ayrshire Breeders' Association. It is to be congratulated on securing his services.

Index Ready

The index for volume 55 of Hoard's Dairyman is ready for distribution. Those desiring this index may secure it for the asking. Address a postal to Hoard's Dairyman Ft. Atkinson, Wis., and state: "Send me index for volume 55." Sign your name and address plainly. There is no charge for the index.

The government has requested that all publications be saving of paper. This is the reason why we are not mailing the index to each one of our subscribers as has been the custom. We shall, however, send the index to every one desiring it.

Hemorrhagic Septicemia

I lost two heifer calves, 5 and 6 months old, from what farmers here claim is poison. They were pastured in an uncleaned lot, with a good deal of swamp in it. They died within a few days of each other, the first one in a few hours. Blood came out through the hide, and they bled profusely from the mouth, had high fever and much pain. The veterinarian could do nothing. Farmers claim they ate a poisonous weed that grows in swamps. One farmer lost five calves some time ago; another three, under same conditions. Is there such a weed?

Tomahawk, Wis. C. H. G.

The cattle in question have died of the acute form of hemorrhagic septicemia, a malignant, contagious germ disease and you should at once keep cattle off all infected pastures and notify your neighbors to the same effect. Meanwhile the state veterinarian, Dr. O. H. Eliason, Madison, Wis., should be notified and arrangement made to have the remaining animals vaccinated.

20 to 25% Bigger Winter Milk Yields

WITH pure, rich milk analyzing 87% water—and with your winter herd *getting only ¼ to ⅓ of their natural water requirement from icy outdoor tanks*, you can see where cold weather cow-thirst is one of the biggest causes of your year-after-year winter milk shortages. With **Simplex Improved Water Bowls** your cows drink "to their hearts' content" day and night. Result—*20 to 25% more milk from every cow all through the housed-in season.* And no more frozen tanks—no tank-heater makeshifts—no more twice-a-day "herding out" periods. *Write for Full Particulars on the Only Drop-Down Water Bowl on the Market.*

F. Rassmann Manufacturing Co., 31 Mill Street, Beaver Dam, Wisconsin.

The Only "Drop Clean" Water Bowl Made

Grow Registered Seed

Of the following pedigreed varieties developed at the Michigan Agricultural College and Inspected, Approved and Registered by the Michigan Crop Improvement Association.

RED ROCK WHEAT

A pure, winter hardy, excellent milling, high yielding wheat.

MICHIGAN WINTER BARLEY

The best northern grown Winter Barley.

ROSEN RYE

The rye that has nearly doubled Michigan's acre yields and is giving exceptionally good results in many other states. Remember rye cross fertilizes so get pure seed from farmers who have produced it under inspection. For list of those having it for sale write the

Secretary of the Michigan Crop Improvement Ass'n., J. W. Nicolson, East Lansing, Michigan.

Jersey Breeders' Picnic

HOARD'S DAIRYMAN:—The annual picnic of the Burnett County, Wisconsin, Jersey Breeders' Association was held on June 29th at the home of Mr. A. J. Dufty on the shore of Devils Lake. It proved to be one of the most interesting events of the kind the writer has had the privilege of attending. One of the strong features of their annual picnics is the splendid exhibition of Jerseys they put on and there is marked improvement from year to year. At this time there were some thirty animals exhibited and first prize state fair winners among them.

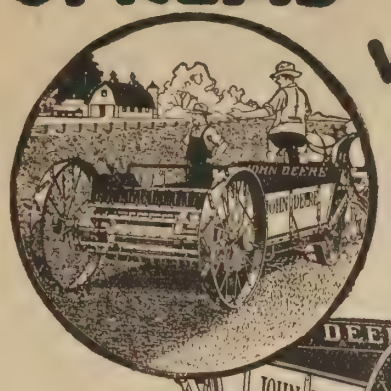
This is one of the newer sections of the state but one that is rapidly coming to the front in every way. The farmers are co-operating in the true sense of the word. Several years ago bull clubs were formed and good sires purchased, a little later two carloads of pure-bred females were purchased and distributed among the farmers at a great saving in price over individual purchasing. Some of the highest record cows and at least one of the best bulls in the state are now owned in this community. A co-operative creamery is running and butter of the finest quality is made from this Jersey milk and sold as "Special". The buttermaker informed the writer that the only complaint they had heard about their butter was because of too high color, while as a matter of fact the only color in the butter is what the Jersey cows put in.

The program, following a bountiful lunch, was held under the auspices of the Wisconsin Jersey Breeders' Association, the president of which, Mr. Wm. C. Bradley, gave a splendid address on the Jersey cow and the war, making the audience feel that they were headed right and spurring them to further effort. Mr. M. D. Munn, president of the American Jersey Cattle Club, was the principal speaker and in his masterly way gave a very comprehensive view of the dairy situation and the large part the Jersey cow plays in this field. Following this Mr. Munn also gave a Jersey cow demonstration showing the type desired and the strong points of a good dairy cow. County Agent Briggs who, by the way, is one of the most live and progressive of the men engaged in this work, spoke of some of his ideals for the county. Rev. Krugg gave a very stirring patriotic address in which he also touched upon the necessity for better farming and improved live stock. The writer made a few remarks on the state and county Jersey breeders' associations, calling attention to the bright prospects before the Jersey breeder and urging loyalty, support, and co-operation in this work.

We can safely predict that when the thousands of acres of desirable farming lands in Burnett County are taken up, the older counties will have to put their best foot foremost to hold their place in the sun.

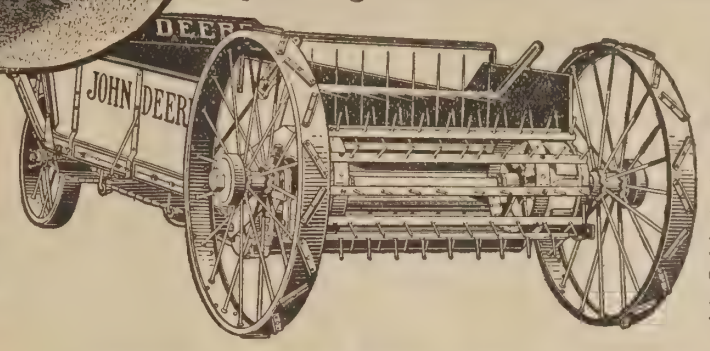
CHAS. A. PETERSON, Sec.,
Wis. Jersey Breeders' Association.

Decline in Washington Dairying



HOARD'S DAIRYMAN:—The dairy business has taken a slump due to a long continued drouth extending from the first of May until the present time. As a consequence pastures are very short and the hay crop is light, and in a very few instances will there be a second crop.

Prices of cows have declined gradually but the farmers are disposing of their surplus stock systematically. Quite a number of cows in the testing association have been sold, but as a rule they have been low producers and the dairy industry as a whole should profit thereby.

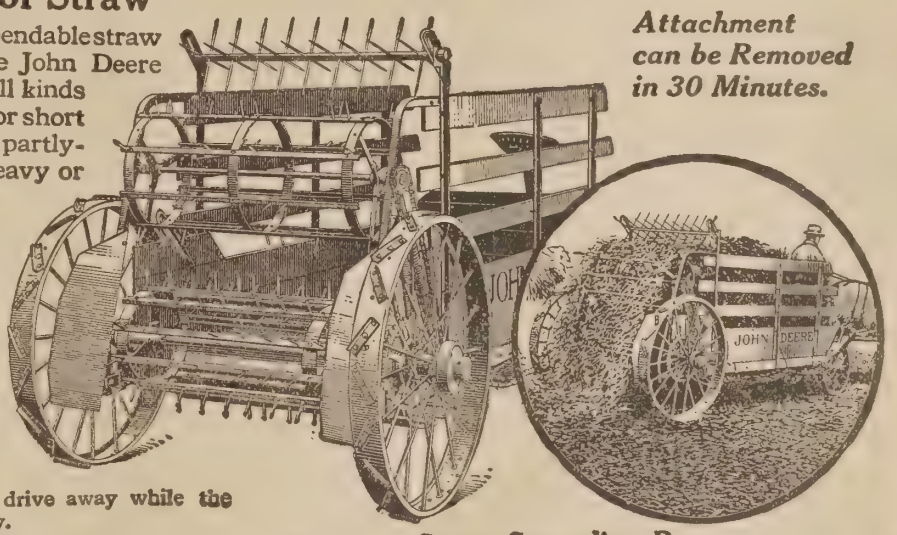


Canadian buyers have been active in this district recently and to date several car lots have been purchased for shipment across the line. They offer a pretty good price but only want sound young cows that have recently calved or will soon freshen.

Washington. H. B. CARROLL.

SPREAD STRAW AND MANURE WITH ONE MACHINE—

A manure spreader pays bigger profits on its use than does any other farm implement. Get double spreader use—double spreader profits. Use one machine to spread both straw and manure. That's one of the big advantages that the John Deere Spreader offers. With its straw-spreading attachment it is a "two-in-one" machine.



The Spreader with the Beater on the Axle.

For years the John Deere Spreader, in use everywhere, has been consistently proving its ability to spread manure to the best advantage with the lightest draft and the lowest cost of upkeep. You can get it now to serve a double purpose — to spread both straw and manure.

JOHN DEERE SPREADER
Spreads Both Straw and Manure

Spreads All Kinds of Straw

Equipped with its simple, dependable straw spreading attachment, the John Deere Spreader spreads properly all kinds of straw—long, tough straw or short straw, light chaff or heavy, partly-rotted straw. It spreads heavy or light, whichever you choose, but always uniformly—no bunching—no uneven spots.

Attachment can be Removed in 30 Minutes.

A "One Man" Outfit

You need no one to help you in the operation. Loading the rack is an easy job. When you are ready to spread you pull one lever to throw the beaters into gear and another to regulate quantity. Then you stay in the seat and drive away while the machine spreads the load perfectly.

Get the Extra Profits

If you are using a John Deere Spreader and haven't yet bought the straw-spreading attachment, see your John Deere dealer about one now. Or if you need a new spreader, be sure to get the John Deere combination machine that pays greater profits because you use it more.

Straw Spreading Pays

Remember, *straw has nearly as much plant food value as manure.* And when spread properly, it prevents soil blowing and protects winter crops against freezing or smothering under heavy sleet.

Organizing for Feed Defense

(Continued from page 67)

tion in the period between 1912 and 1917 was 17,600,000 bushels. The condition of the crop on July 1, 1918, was 79.8 per cent, compared with 84.0 per cent on July 1, 1917, and 83.2 per cent as a 10-year average. The yield per acre is estimated at eight bushels this year, compared with the final yield a year ago of 4.7 bushels and 8.2 bushels as the average between 1908 and 1917.

Probably the most important immediate influence in the linseed cake and meal market is the recent announcement by the War Trade Board of Washington, forbidding the importation of flaxseed to the United States. Students of the flaxseed situation estimate that between 28,000,000 and 30,000,000 bushels of flaxseed are required by crushers each year, while our average production is more than 10,000,000 bushels below this total. The greatest production of flaxseed in the United States was only 25,000,000 bushels. With a crop of less than 16,000,000 bushels this year, and the country having witnessed abnormally small yields in the two preceding years, many crushers doubtless will be forced to suspend operations, and a shortage of linseed cake and meal may be expected. The visible supply of flaxseed at Minneapolis is less than one-third of a year ago.

Argentine usually exports a great quantity of flaxseed to the United States, but, aside from that already in transit or loaded for this country, the War Trade Board will refuse entrance to all shipments. Due to this order, prices for flaxseed advanced to the highest price in history on the Minneapolis Chamber of Commerce recently, $4.60 per bushel.

Linseed meal is selling at approximately $56 a ton in bulk, basis the Minneapolis market. The price a month ago was $44 a ton. Last spring, when accumulations arising from the blockading of the export outlet, supplies were offered as low as $27.50 a ton. A year ago this season the market was on a basis of $28 a ton in Minneapolis.

Unlike former years, the export markets are receiving only a small quantity of linseed and cottonseed cake and meal. The great decrease in exports of these commodities is the result of drastic prohibitions of foreign shipments by the War Trade Board, short crops of both cotton and flax in the United States, and an extreme scarcity of shipping space. No surplus of either cottonseed or linseed feeds has been created as a result of the absence of export business, as crushers never before witnessed such a widespread domestic demand for their products. Because of a shortage of potash, which normally is imported from Germany, fertilizer manufacturers have been forced to purchase great quantities of cottonseed products. Live stock feeders, too, are using far more cottonseed and linseed feed than in normal periods.

A year ago today, the present export restrictions were not yet in effect, but this difference on the new crop, which means relatively more feed for domestic consumption, will be overcome by the import restrictions and light flaxseed crop. Also, peace would be bullish on these feeds temporarily, as the outlets to the big European importing markets would be re-opened.

A shortage of labor will doubtless further restrict the operations of crushing plants in both the South and Northwest. Then, too, it must be remembered that neither the flaxseed nor the cotton crops have been made. The critical periods in the growth of both plants are yet to come, and war feed clubs should keep in mind the

possibility of a reduction in the probable yield because of unfavorable weather conditions. A year ago much cotton acreage that gave hope of a fair crop in July proved a failure because of drouth. A shortage of tank cars for shipment of cottonseed oil from crushers' plants is another probability affecting the operation of the plants. Then, of course, possible scarcity of freight car equipment to move the feed must be considered.

It seems probable that early purchases of cottonseed and linseed feeds, that is, buying when the new crop supplies become available, will prove profitable to war feed community organizations. Present market conditions do not indicate lower prices; instead, the outlook is for higher prices during winter months, or at least a maintenance of current quotations. As already noted, too, the storage and interest charges may be more than offset by the value of the assurance that needs of these feeds are supplied.

Farmers' Excursion to Green County, Wisconsin

HOARD'S DAIRYMAN:—Eighteen of Iowa County's most progressive farmers formed the excursion party which went on a sight-seeing tour into Green County on Thursday, July 11. The trip was made by automobiles, and although the men actually saw but a small portion of Green County's great dairy advantages, they were unanimous in voting that Green County was "different".

The men from Iowa County wanted to see some fancy dairy herds. They saw them at the farms of J. Carl Penn, Herman Gempler, and Arthur Collentine. Mr. Penn's herd is made up of exceptionally good, pure-bred Holsteins, and each and every one a splendid individual. They wanted to see some up-to-date dairy barns. They saw at least one splendid type at the farm of Mr. Collentine.

The men from the northern county wanted to see real alfalfa, and to secure some information on the use and value of ground limestone as a neutralizing agent for soil acidity. They saw alfalfa, a great deal of it, on the farms of W. N. Preston, John Waelti, and T. J. Patton. However, the outstanding feature of the alfalfa demonstration was the superiority of the Grimm variety over the common strains. In the judgment of the visitors, the Grimm scored a knockout over any other variety grown in the county.

The demonstration plots at the Green County Poor Farm plainly showed the value of limestone as a corrective of soil acidity. Here, too, were very good illustrations of other growing crops. Corn high in percentage of germination showed poor growth because of deep planting. Soy beans, planted with corn, are being grown for silage purposes. Fifty-five alfalfa plots of numerous varieties, and with widely varying rates of seeding, are being grown to determine the varieties and rates of seeding best suited to Green County conditions.

Nor were the benefits of the trip limited to knowledge gained by observation. Professors G. C. Humphrey, E. L. Luther, and W. W. Weir, of the University of Wisconsin, gave some exceedingly interesting and valuable talks on different phases of farm improvement. Professor Humphrey talked on "Feeding the Dairy Cow", Mr. Luther on "Farm Marketing," and Professor Weir on "Value of Commercial Fertilizers."

"Green County is different," the visitors said. "It differs mainly in its progressiveness."

Association Notes

Manawa and Ogdensburg, Wisconsin:—Two boarder cows have lately been sold for beef and one pure-bred bull purchased in the association. Milks sells for $2.20 per hundred pounds, a test of 4% being required. The creamery pays 48c for fat and the cheese factory, 49c. Milk retails for 10c, butter for 45c, and cheese for 42c, Oats costs 85c per bushel; corn bran, $48 per ton; and wheat bran $40.

Meadville, Pennsylvania:—We have lately held a very successful testing demonstration in the Townville high school. In ten months of this testing several of the old members exceeded the record made by their herds for the twelve months of the first year. Milk sells for $2.10 per hundred pounds, a test of 3.5% being required. The cheese factory pays 47.4c per pound for butterfat. Feed prices are as follows: Big Q, $62 per ton; corn meal, $68; bran, $50; cottonseed meal, $60; oil meal, $63.

North Chenango, New York:—The past month has been a very successful one in the North Chenango Association. Most of the dairies have done fine work as shown by the high producing cows, over fifty producing over twelve hundred pounds of milk or over forty pounds of fat.

Ten cows were sold last month, none were bought in, and a few very fine two-year-old heifers have freshened. A few more carloads of feed have been bought by members of this association at what seems to be a very reasonable price. Many of them are beginning to feed grain now and most of them mix their own rations at quite a saving in price and with better results. All of the members are using pure-bred sires and all but two own them. There are a few very fine and valuable bulls in this association. Ten members of the nineteen are using milking machines at a saving of much time and labor.

In the past month in this community the following prices prevailed: Milk sold at shipping stations for $2.40 per 100 lbs. plus 4c per point above 3 per cent. Milk retails in local urban districts for 10c per quart, butter for 50c per pound, and cheese for 30c per pound.

Otsego No. 1, New York:—About one-half of the farmers are feeding grain during the flush of feed and will get paid for it in the long run. My experience with three years' testing is that the cows hold up better on milk and do not lose flesh as they are apt to if not grained.

In the past month in this community the following prices prevailed: Milk sold at shipping stations for $1.60 per 100 pounds plus 4c per point above 3 per cent. Milk retails in local urban districts for 12c per quart; butter, for 45c per pound.

Minnesota Record Herd

The highest producing herd in June in Minnesota associations was that owned by Wm. Martig of the West Concord Association. The herd of 20 cows averaged 1,260.3 lbs. milk, 41.8 lbs. fat. About 450 herds from 15 different associations were reported.

Impotent Bull

What would be the trouble when a bull is a slow and poor breeder? We have a bull coming 2 years old and he is getting to be a poor breeder. He has plenty of exercise and he has fully a half acre for pen. He is in good condition, but not fat. We feed him clover or alfalfa hay, but never more than what he can clean up. We fed him a little corn and cob meal and bran mixed last winter and now we feed a little bran. We mostly used him for young heifers and a few cows last winter and we never gave him more than about three or four a month. He is also getting very mean. What would you suggest to do in this case?

Florissant, Mo. J. W.

Put the bull to work in harness or a treadpower. If that is impossible, let him butt at a big wooden block or smooth stump hung by chains from an overhead beam in his paddock. Feed oats and bran in addition to good hay and green feed. Better have him dehorned if he is mean. If he is not a confirmed masturbator he should improve under this treatment.

The Holstein-Friesian World and the Black and White Record announce a merger, effective August 1, 1918. At that time both organizations will unite in building a bigger and better Holstein-Friesian World.

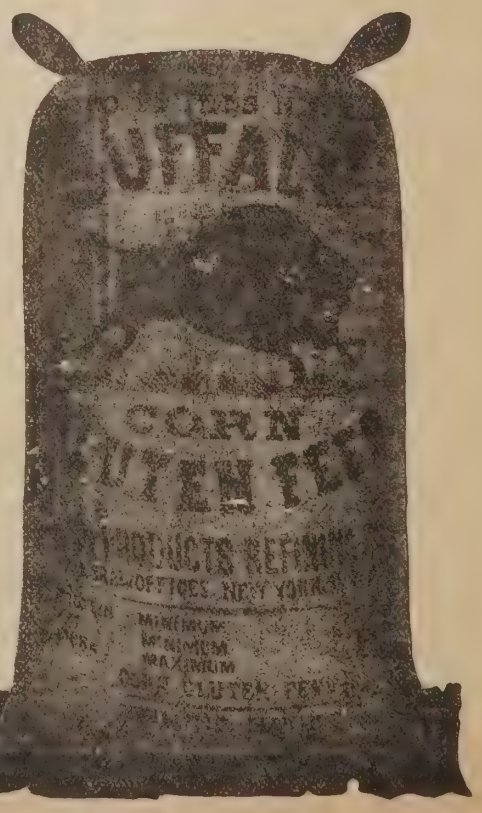
30 COWS WANTED

MUST BE HOLSTEIN

well marked, milk 40 pounds at best: fresh before December 1st. State age and price.
W. F. COOK, GRAY'S LAKE, ILLINOIS.



Feed Well in Flytime

When the good pasture of early summer is baked and tramped out—and the flies are bad—and it's dry and hot—

That is the worst time of the whole year for the cow.

Then is when so many good dairymen feed their cows

BUFFALO
CORN GLUTEN FEED

The cows, when they are back in the barn at hard work next year, will pay well for all the Buffalo Corn Gluten Feed they get this summer.

Not only that, but they pay well for their summer Buffalo Corn Gluten Feed right along as they get it. It keeps them up in production in the hot season.

We know a great many very good dairymen who feed Buffalo almost as heavily in summer as they do in winter.

And when men follow that system for thirty years it surely must be a paying proposition.

NOTICE—It would pay you to return to your dealer any feed bags bearing our brands which you may have in good condition.

CORN PRODUCTS REFINING CO.
CHICAGO NEW YORK

New York Holstein Picnic Sale

HOARD'S DAIRYMAN:—Holiday pastime was evidently the motive that attracted a large portion of the crowd of more than 3,000 persons who attended the annual picnic sale of the Otsego County (New York) Holstein Breeders' Association on the Fourth of July. The day was perfect, accommodations comfortable, Governor Charles S. Whitman spoke, a band furnished entertainment.

To Holstein breeders, the really important part of the program was the sale of 57 head of selected animals consigned from prominent local dairies. The total sum received was $11,735, making an average of $205.87. A few low priced male calves without special record backing are included in this report, so the average price of mature cows was considerably higher. The central figure in the sale was Otego Valley Christmas Belle who, on her sixth birthday last Christmas, gave 93 lbs. of milk. This was during her test when she made a 7-day record of 24.02 lbs. of fat from 613 lbs. of milk. She was bred and consigned by Leon J. Potter and went to the large dairy farm owned by Linn Kinne. She sold for $1,075, and her four-year-old daughter brought $300. Segis Aaggie Ormsby Lyons, of the line of breeding of the Great White Heifer and consigned by Ernest M. Johnson, sold for $500. Several cows ran around $300 each.

Bidding lacked enthusiasm on many of the likely young cows with excellent blood lines, but without marked record backing. Such stock is not uncommon, and the demand is just now somewhat slack owing to light hay and failure of the corn crop in some parts of central New York. Prices on a few such cows was as low as $145, the value placed on superior grade cows last spring. Varying uncertainties of the milk market tend to panicky conditions, while close money weakens speculation of small breeders. Spectators overbalanced bidders throughout the sale, but keen interest was felt by most persons who packed the large tent. C. F. MEYER.

Otsego County, N. Y.

California Milk Prices Go Up

HOARD'S DAIRYMAN:—The milk producers of Alameda County, California, have notified the distributors that, effective August 1, 1918, the price of milk will be raised from twenty-five cents per gallon, the present schedule, to thirty-one cents. Since this means that the distributors will have to raise the price to the consumer, they have asked State Food Administrator Merritt to take up the matter and try to adjust the difference. They claim the producers are making the raise without the authority of the federal food administration, and the producers claim they do not need governmental authority because they do not come within the class of firms required to take out government licenses.

The retail price of milk in Alameda County is now somewhat lower than in most eastern cities.

Across the bay, in San Francisco, the producers and distributors, acting in conjunction with the federal food administration, have been working on plans to cut the cost of distributing milk, and it is reported that they have devised a plan to do away with duplication of routes by different distributors. It is probable that the food administration will be asked to do something along the same line in this county.

California. L. L. DE BRA.

Have you talked with your neighbors about subscribing for Hoard's Dairyman? Why not do it now? Make up as large a club of subscribers as you can and send them in.

Don't run the risk of a possible feed shortage next winter due to shipping difficulties—be on the safe side—order your feed NOW and be sure that you order feeds that meet your requirements best. Actual feeding results and low cost make it decidedly to your advantage to stock up on the "old reliable"

SCHUMACHER FEED AND BIG "Q" DAIRY RATION

SCHUMACHER FEED has time and time again proved its merit in record making, record breaking long distance milk and butter production tests—it has to its credit (fed with high protein concentrates) more World's Champion Milk and Butter Records than all other feeds combined. SCHUMACHER FEED is a grain ration that supplies ENERGY — STRENGTH — STAMINA and ENDURANCE that cows must possess if they are to be big producers. SCHUMACHER FEED is also an ideal feed for dry cows, horses, hogs and growing stock.

15 Cents Apiece for Jute Sacks

Your dealer will pay you 15 cents apiece for empty jute sacks of our brands returned to him in good condition.

BIG "Q" DAIRY RATION is a protein ration of the highest quality made on the modern idea of "highest quality" of protein content—a wonderful milk producer.

By having a liberal stock of SCHUMACHER FEED and BIG "Q" DAIRY RATION you will be independent of a feed shortage and be assured of best results from all your stock because SCHUMACHER FEED and BIG "Q" are splendid result-producing feeds.

Also as a price consideration it is to your advantage to stock up on these feeds. Our liberal allowance of 15c each for jute sacks of our brands makes SCHUMACHER FEED $20 to $25 per ton cheaper than good corn and many dollars per ton cheaper than hominy feeds.

Don't delay — order NOW. Your dealer can supply you NOW — he may not be able to later. "A WORD TO THE WISE IS SUFFICIENT."

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Junior Farmers at the State Fairs

How many of you juniors are going to exhibit at your state fair this fall? A good many of you should. The management of your state fair has very likely made special provisions for junior farmers. In some cases they even pay the cost of the exhibits to and from the fair, and give the boys a chance to stay during the entire fair at practically no cost to them. They want you there and you should want to be there.

Why? In the first place, a good state fair is an education. There is no better place to find out just what other dairymen and farmers are accomplishing. This is particularly true if you are exhibiting. Then, you can hardly help but see where the other fellow's calf is better than yours and if you're wise you'll try to find out why he was more successful. There is a chance for you to learn a good deal and of course there is also a chance to win some of the prize money as well as to have a very good time.

Be an exhibitor this year if you can. If not, go anyway, keep your eyes open, find out about the junior farmer exhibits, and plan to have a share in that department next year. It will be worth your while.

Wisconsin Juniors at Their State Fair

There should be more boys and girls at the Wisconsin State Fair Sept. 9-14, as exhibitors, than ever before and present indications are that there will be. Approximately $3,000 is offered in prizes and the many classes of exhibits open to junior farmers makes it possible for almost every Wisconsin boy or girl to be an exhibitor.

This year there are nearly 1,000 young people feeding dairy calves and at least 100 of them will exhibit at Milwaukee. There are 1,100 pig club members and a good proportion of these will be there, too. A new exhibit in the live stock department will be the sheep brought in by members of the sheep clubs, which were organized during the past winter and spring. Five thousand young people belong to poultry clubs in the state and they too will be well represented.

In addition to the live stock contests there will be classes for field and garden exhibits, beef calves, and samples of work done by sewing, baking, and canning clubs. In short, there will be a chance for every one, whatever he or she may be interested in.

Not the least interesting or important of the features planned for junior farmers is the camp for boys and girls. The object of it is to furnish meals and lodging for the boys and girls who come to the fair as exhibitors or contestants. It will be under the direction of the Young Men's and Young Women's Christian Associations with W. H. Wones, state Y. M. C. A. secretary, in charge. The price of board is seventy-five cents a day for those who remain more than two days and one dollar a day for those who are in camp two days or less. Each camper furnishes his own bedding. Here is his daily program:

A. M. 6:30—Reveille: rising call.
7:00—Breakfast.
7:30—Brief devotional exercises.
8:00—Camp duties.
8:30—Excursion to some department of the fair.
9:30—Preparation for contests.
10:00-12—Contests.
P. M. 12:30—Dinner.
1:30 to 5:00—Contest work, sight seeing at the fair or excursions to Milwaukee under special supervision.
5:30—Supper.
6:00 to 7:30—Group games.
7:30—Evening entertainments.
9:30—Tattoo—Get ready for bed.
10.00—Taps: Lights out.

Mr. T. L. Bewick of the State College of Agriculture, Madison, is superintendent of this Boys' and Girls' Department.

For Minnesota Boys and Girls

Minnesota always has a strong state fair which includes an excellent department for junior farmers. This year, Sept. 2-7, this is expected to be an especially strong feature, better than at previous fairs.

One of the best of junior exhibits will be that put on by pig club members. These clubs are strong in that state and for several years the members have been showing very good pigs at the state fairs. This year the boy or girl owning the winning pig in each of the counties in the state where contests are held is to enter the state fair competition and one of the fine things about it is that the State Fair management pays the transportation charges to and from the fair and cares for the pigs while on the grounds.

Another of the features is that to be put on by the corn club members. Every boy finishing in the "Acre Yield Corn Contest" is eligible to enter a 10-ear sample of his corn in this contest and try for a share of the $300 that will be distributed as prize money.

The boys who were winners in the pig, corn, or potato club contests have a chance to be included in the Farm Boys' Camp at the fair grounds where they will have an excellent opportunity to study the best and most recent products of scientific and practical achievement in agriculture in the state of Minnesota. It is expected that there will be 172 boys enrolled at camp this year. A similar camp will be established for the girls, winners in bread making contests in each county.

In addition there will be a chance for junior farmers to exhibit samples of vegetables, fruit, etc.

Mr. T. A. Erickson, University Farm, St. Paul, has charge of this work.

At the Iowa State Fair

Every branch of Iowa club work will be represented at the State Fair, August 21-30. Premiums amounting to $3,200 have been arranged for, so that there is an incentive for every junior farmer belonging to any of these clubs to exhibit at the fair.

This is the third year for the Iowa Beef Club exhibit at the State Fair. The first year, 1916, opened with thirteen entries and last year fifty-nine calves entered by fifty-two club members from twenty-four different counties competed for the $450 offered in prizes. This year there will undoubtedly be at least 150 calves entered in this contest for which a total of $630 in prize money is offered.

The pig exhibit planned for this fair is the first that has been conducted under the direction of the state club department. There are two classes in this pig contest, both of them open to all Iowa boys and girls enrolled in the pig club work. In the first class only pure-bred pigs, Poland-Chinas, Duroc-Jerseys, Chester Whites, or Hampshires, can be entered. The second is open to pure-bred or grade pigs of any breed. One thousand dollars in prizes is offered to the winners in these classes.

In addition to these special classes for stock entered by the boys and girls of Iowa, these junior farmers, can enter their calves or pigs in the regular open classes in direct competition with other breeders. Last year some of the beef club members did this and succeeded in carrying off $180 of the prize money.

At the close of the Fair a public auction sale is to be held for the benefit of those club members who may wish to dispose of their calves or pigs. Last year this feature of the exhibit proved to be very satisfactory, forty-five of the fifty-nine calves being sold for an average of $14.63, considerably above the market price.

A. J. HESLER, SUPERVISOR, AND GLEN REED OF INDIANA, A PIG CLUB MEMBER, REMOVING THE SHARP TUSKS FROM THE MOUTH OF A PIG.

A new feature of the State Fair work this year will be the judging contest of five club members from each county. From these contestants a champion team will be selected to represent Iowa in the Interstate Fair at Sioux City to compete with teams from other states.

Nor is that all. There are classes for canned products put up by members of canning and garden clubs for exhibits of handicraft work, and exhibits from the poultry, corn, cooking and sewing clubs. In short, there is a chance for every Iowa boy or girl club member.

Special privileges and arrangements are made for those exhibiting at the Fair. Camping accommodations are furnished by the Fair Association under the supervision of a representative from the Agricultural Extension Department.

Prof. E. C. Bishop at the State Agricultural College, Ames, Ia., has charge of this work.

Boys' and Girls' Clubs at the Kansas Fair

Boys' and Girls' club exhibits this fall will stand forth as true patriotic emblems for Kansas. At both of the state fairs and also at the International Wheat Show at Wichita, conservation and production in nearly every form will be exhibited.

The pig, poultry, garden, bee, sorghum, baby beef, and corn clubs will show their very best results for Uncle Sam. Garden parades with hoes and rakes will help to express the true spirits of the "Garden Guards".

The mother-daughter canning clubs will combine their efforts and send "100-quart" exhibits of fruits and vegetables, emphasizing co-operation and conservation rather than a tendency toward individual work and novelties. This blue ribbon exhibit in canning will carry home $50 for its club.

A most economical and practical exhibit of war breads will be prepared by the bread club girls and boys, thus showing what they can do with wheat substitutes.

The garment making girls have spent much of their time on Junior

MILK CARRIERS IN MEXICO

Use Your Ford!

to FILL YOUR SILO

Pump Your Water, Grind Your Feed, Saw Your Wood

—and for all other farm work.

12

Ward Work-a-Ford

Gives you a 12 horsepower engine for less than the cost of a 2 horsepower. The Ford car has a powerful engine—it will outlast the car—and you might as well save your money and use it to do all your farm work. **No wear on tires or transmission.** Hooks up in 3 minutes. No permanent attachment to car. Cannot injure car or engine.

Friction Clutch Pulley on end of shaft. Ward Governor, run by fan belt, gives perfect control. **Money back if not satisfied.** Ask for circular and special price.

CORN HARVESTER Self Gathering for cutting Corn, Cane and Kaffir Corn. Cuts and throws in piles on harvester. Man and horse cuts and shocks equal to a Corn Binder. Sold in every state. Price only $25 with fodder binder. The only self gathering corn harvester on the market, that is giving universal satisfaction.—Dexter L. Woodward, Sandy Creek, N. Y., writes: "3 years ago I purchased your Corn Harvester. Would not take 4 times the price of the machine if I could not get another one." Clarence F. Huggins, Speermore, Okla.: "Works 5 times better than I expected. Saved $40 in labor this fall." Roy Apple, Farmersville, Ohio: "I have used a corn shocker, corn binder and 2 rowed machines, but your machine beats them all and takes less twine of any machine I have ever used." John F. Haag, Mayfield, Oklahoma: "Your harvester gave good satisfaction while using filling our Silo." K. F. Ruegnitz, Otis, Colo.: "Just received a letter from my father saying he received the corn binder and he is cutting corn and cane now. Says it works fine and that I can sell lots of them next year." Write for free catalog showing picture of harvester at work and testimonials.

Kill All Flies! They Spread Disease

Placed anywhere, **Daisy Fly Killer** attracts and kills all flies. Neat, clean, ornamental, convenient, and cheap. Lasts all season. Made of metal, can't spill or tip over; will not soil or injure anything. Guaranteed effective. Ask for

Daisy Fly Killer

Sold by dealers, or 6 sent by express, prepaid, $1.00.

HAROLD SOMERS, 150 DeKalb Ave., Brooklyn, N. Y.

Red Cross work as well as club work and will undoubtedly have an unusually good display this season.

Besides the regular exhibits, the Wichita International Wheat Show will offer a special attraction in the way of demonstration contests. This is chiefly a war time measure. Twelve winning teams, six canning and six bread, will meet at this fair to determine the victors. Baby Bonds will form the prizes and the enthusiasm and interest thus aroused will certainly make boys' and girls' club work a never-to-be-forgotten feature of the fair.

The dates for the Kansas fairs are as follows: International Wheat Show—Wichita Fair, Wichita, Sept. 30 to Oct. 12; Kansas Free Fair, Topeka, Sept. 9 to 14; Kansas State Fair, Hutchinson, Sept. 14 to 21.

R. M. MATEER,
Emergency Assistant State Club Leader, Kansas.

Junior Letters

Hoard's Dairyman Juniors:—Please excuse me for not answering your letter before this but I have had to do a good bit of work. I sold my Angora goat and got $11.50 for her, but I still have my rabbit, pig, and guinea pig. My guinea pig had 4 little ones yesterday and they look as if they were a month old. I feed them a little green alfalfa, some hay, and a pan of milk each day. My pigs are also doing fine. I never saw pigs eat so much. In the morning I feed them 2 quarts of bran, 1 quart of chop mixed with 2 gallons of milk and 3 quarts of water, and a wheel-barrow full of green alfalfa. At noon I give them a bucketful of slop and at night the same as in the morning. I do not take much interest in my rabbits but all I feed them is some green alfalfa. Wish that some of the juniors would write to me. My address is Rocky Ford, Colorado, R. R. No. 2, Box. 100.

Gilbert J. Miller.

Hoard's Dairyman Juniors:—It has been a very long time since I wrote you. Last year it was so wet that we did not get any corn planted till the 16th of June, then it all got frozen last fall and wouldn't grow or keep for this summer. Good seed corn shelled and graded was worth $8 a bushel.

I passed the seventh grade last year and this year I passed the eighth grade and received my certificate the 22nd of May at the county superintendent's office. There were 74 eighth year graduates in my county. I want to go to high school next year.

We have 30 acres of corn planted and we want to plant about five acres of cowpeas. I helped papa haul alfalfa hay yesterday. We got one load apiece from our bottom about 12 miles away and we want to get another load apiece tomorrow. Then we will have to cultivate some corn because the ground is very dry. We have not had any rain for some time. It is very hot today.

I read some of the letters of the juniors this morning. As a junior asked us to tell him what to do for chickens that eat eggs I will say we feed our chickens pearl grit or ground mussel shells and as food we feed them chowder and scratch feed.

I have one cow and papa has twelve cows and eight heifers. We also have three male calves for sale.

As my letter is getting long I will close. My address is R. F. D. 2, Box 12, Effingham, Ill.

Samuel D. Ramsey.

Hoard's Dairyman Juniors:—I hail from the most northern state in the Union, a state that is famous for bears. In your letter you asked me if all the grade calves were being vealed? Men are raising their calves here this summer so if there is a light hay crop calves will be cheaper. I live on a 400-acre farm. We have two farms, one is rented for three years.

Papa gave me a calf this morning and I am going to work on the farm to pay for it. It is a heifer and I am going to raise it for a cow. Her name is Lucy. She is not quite six weeks old now and quite large.

We have four heifer calves we're going to raise. Now, for stock we have eight cows, four calves, one pig, and three horses. The pig is a month old. We have taken in three horses to pasture and turned out one of ours.

I am going to have a garden this year. Last year I got a prize of 50 cents for my garden.

Maine. C. A. Woodrow.

Hoard's Dairyman Juniors:—I received your letter and will be glad to answer it.

We have a pure-bred Jersey bull. He is about 2 years old now. My father thinks the Jerseys are good milk cows so he expects to get all Jerseys. I bought a pig from my father for $6. I have built a house and a pen. I feed him three times a day. He gets milk, feed, and water. I am going to sell him.

I joined the potato club. My plot of land is 27 ft. by 95 ft. Yesterday I hoed my patatoes. We have hoed our corn once but expect to hoe it again. In my garden I have carrots and peas. All is growing nice.

Wisconsin. Mandly Hendrickson.

The LAUSON 15-25

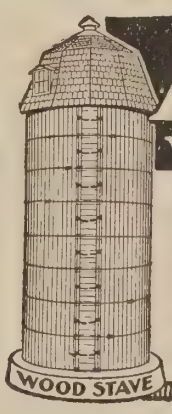
DUST PROOF-ALL GEARS ENCLOSED

At a recent demonstration out West only two, wheel type tractors went up a 33% grade with all plows in the ground. One of these was the Lauson 15-25. All the leading makes were represented.

For twenty-three years the John Lauson Manufacturing Co., has been making farm engines and has been making them so well that their reputation is second to none.

This experience has enabled them to build the Lauson 15-25 Kerosene Tractor so that it is years ahead of its competitors.

It has all the mechanical refinements of the best engineering practice combined with a ruggedness that makes it stand up under the hardest kind of service without annoyance of expensive breakdowns. **Durability** is built into the Lauson.



The frame is mounted on four wheels on the three point suspension principle. This gives flexibility without the danger of tipping on hillside work. The entire weight of the machine is sufficient to give good traction, without slipping and not so heavy as to cause packing of the soil. The front wheel crowds the furrow and requires no steering. The Lauson 15-25 will travel the entire length of the field without the operator touching the steering wheel.

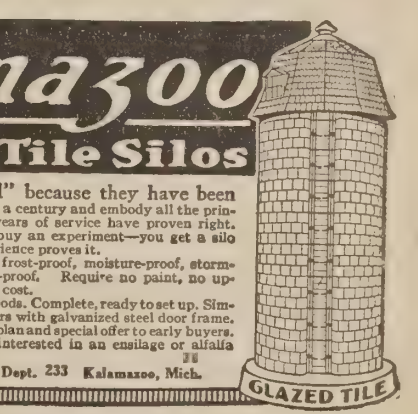
Twenty-four Hyatt and Timken roller and ball bearings on the Lauson give it the name of the "full jewelled" tractor. **All gears**—including the bull gears are enclosed in a dust proof casing and run in oil. This reduces friction and wear to the minimum, saves fuel and increases draw bar pull.

Builders of Lauson Frost King Engines

For 23 years Lauson Frost King engines have been the standard of farm engine excellence—built in 2½ to 50 H. P. sizes.

THE JOHN LAUSON MFG. CO., 528 Monroe St., New Holstein, Wis.

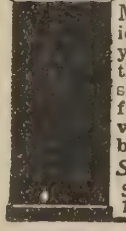
Kalamazoo Wood and Tile Silos



known as "the world's standard" because they have been in constant use for more than a quarter of a century and embody all the principles of construction that these many years of service have proven right. When you buy a Kalamazoo you do not buy an experiment—you get a silo that you know will serve you well. Experience proves it.

Glazed Tile Silos that are fire-proof, frost-proof, moisture-proof, storm-proof, acid-proof, decay-proof and vermin-proof. Require no paint, no upkeep expense or repairs. First cost is last cost.

Wood Stave Silos—choice of four best woods. Complete, ready to set up. Simple, safe anchor system and continuous doors with galvanized steel door frame.



Write today for catalog, easy payment plan and special offer to early buyers. Buy now and avoid disappointment. If interested in an ensilage or alfalfa cutter, ask for circular.

Garget

I have a cow whose bag is very peculiarly ffected. In the morning one section may be readfully swollen and probably at night the welling has entirely disappeared. This swelling changes from one section to another for wo or three days after which time it disappeared for some three or four weeks.

Kingston, La. A. D. S.

In such cases it is always well to ...ave the tuberculin test applied as tu...erculosis sometimes is the cause of ...uch mysterious intermittent attacks ...f garget. Also try to prevent chill, ...ruising, changes of feed, or irregularity or roughness in milking.

United States Help Badly Needed Harvest Hands Wanted

Military demands from a limited population have made such a scarcity of farm help in Canada that the appeal of the Canadian Government to the United States Government for

Help to Harvest the Canadian Grain Crop of 1918

Meets with a request for all available assistance to go forward as soon as our own crop is secured.

The Allied Armies must be fed and therefore it is necessary to save every bit of the crop of the Continent—American and Canadian. Those who respond to this appeal will get a

Warm Welcome, Good Wages, Good Board and Find Comfortable Homes

A card entitling the holder to a rate of one cent per mile from Canadian Boundary Points to destination and return will be given to all Harvest Applicants. Every facility will be afforded for admission into Canada and return to the United States. Information as to wages, railway rates and routes may be had from the

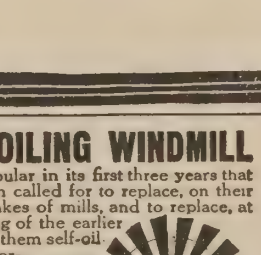
UNITED STATES EMPLOYMENT SERVICE

Branches in all large cities of the U. S.

Who Fills Your Silo?

THERE'S just one way of being sure of a full silo of clean cut ensilage. That is to fill with your own equipment. A farm gas or kerosene engine developing as little as 3 or 4 horse power will operate a small

PAPEC
Ensilage Cutter



If a saving of from $100 to $200 a year appeals to you, you owe it to yourself to investigate the ***PAPEC*** Ensilage Cutter. Our 1918 catalogue illustrates in three colors and fully describes each of the four sizes of ***PAPEC*** Cutters. There's a size for your very needs. We have a catalogue for you—write for it today.

PAPEC MACHINE CO.

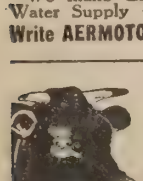
Shortsville, N. Y.

There's a PAPEC dealer in your locality



THE SELF-OILING WINDMILL

has become so popular in its first three years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load.

We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws.

Write AERMOTOR CO., 2500 Twelfth St., Chicago

Safe and Sure

catches easily and locks firmly. Has straight pull—no twisting. Your bull will respect the

KEYSTONE BULL STAFF

Shepherd's crook, automatic latch, easy to release, taper socket riveted fast to 5-foot heavy ash handle.

Guaranteed.

M. T. PHILLIPS, BOX 106B, POMEROY, PA.

Get A Gehl Silo Now

Act quickly to save your corn crop—to save money—to back up your government. Councils of defense and other war winning organizations as well as agricultural authorities are urging farmers to build silos this year so as to increase and conserve food supplies.

We Can Ship Immediately

Special attention will be given to rush orders. We have the material in stock and can make prompt shipments.

Gehl Silos are made of the best ensilage-preserving wood in the world—clear, straight-grained Oregon Fir which is recognized as the best silo material, not only because it is very strong, lasting and durable, but because it keeps the air out and the moisture in, preserving the ensilage in perfect condition and retaining the appetizing flavor that makes the cows relish it.

Gehl Silo lumber is perfectly milled to standard silo pattern and is strictly clear and free from knots. One or two piece staves in any length up to 40 feet. As our contribution towards this silo campaign we will allow

A Special Discount on All Sizes

ordered during August and September. Write today for full information. State size of silo you want.
If interested in ensilage or alfalfa cutters ask for cutter catalog.

GEHL BROS. MFG. CO., Dept. 122 West Bend, Wisconsin

Price Fixing and Cost of Farm Products

(Continued from page 71)

main the same. Likewise the question of joint costs is avoided, for it is no longer a question of the cost of a specific product, but of comparing the total farm profits resulting from the various types of farming and from the different competing elements in each kind of farming. Furthermore, the question of charging feed at market price or cost of production would seem to pass with the effort to find specific costs.

However, something akin to the latter remains. The farmer may compare the profits he would make if he sold his corn, oats, and hay at present market prices instead of feeding them to cows and selling milk. In this he should not assume that if the community turned from milk selling to crop selling that the prices of all these crops would be what they were before the change; neither should he assume that his crops would yield the same if he changed to grain growing for the market. Oats and corn are used directly for human food and have many other uses and are so easily shipped that there would continue to be a market for them, if not used as cow feed; but clover hay is a stock food and it is not so easily marketed. The important alternative uses for clover if not used for cows are (1) to feed to beef cattle, (2) to sheep, or (3) to plow under as a fertilizer, any of which conserves its value as a land builder as a basis for grain growing. Where clover has entered into commerce it has usually been as a feed for dairy cows. When discarded for this use, therefore, the marketing of clover hay could not be counted upon. A farmer in the Chicago milk district insists at this moment that it pays better to sell grains and plow the clover under than to make clover hay and feed it to live stock. He is practicing this system now and is satisfied. In this and similar cases it is the alternative use value rather than cost or present market price which becomes the basis of comparing the profits of types of farming and hence the basis of choice.

This means that formerly assigned specific costs are of little use in the discussion of price fixing. It does not mean, however, that cost accounting is of no use in the study of this problem; in fact, accounts are very necessary, but in a different way from what has been supposed. Accounts are useful to the farmer in making choice of crops and live stock enterprises and his methods of production. Accounts are useful to the price commissioner in estimating the price necessary to call out continuously the desired supply of produce of a given kind and of suitable quality. For these purposes specific costs may not be needed. What are needed are figures comparing the profitableness of the different things to which the producer can turn his attention. The alert farmer is ever figuring on the combination of crop and live stock production which will pay him best with a given price schedule and with given costs for land, labor, and equipments.—H. C. TAYLOR in Bulletin 292 Wisconsin Experiment Station.

For Private Sale

Having recently been elected Secretary and Treasurer of the White Eagle Dairy Company, I will not have the time to give the close attention to breeding and the production of milk which I have in the past and am offering the public a rare opportunity to buy some choice foundation stock, both cows and calves. I have been engaged in the breeding of Jerseys for nearly ten years, and have never had a public sale and will depend largely on my many satisfied customers to buy this stock and will give them the same fair treatment which has characterized my business from the start.

Write me for list of the stock, the milk and fat records, the breeding and prices. This will be your best opportunity this year to select some choice foundation stock, rich in the blood of Noble Oaklands and Oonan of Riverside.

Unprofitable cows have always been culled from my herd. Nothing but good paying cows in this offering.

Five tests of my herd and never a case of tuberculosis.

D. V. VANDIVER, Columbia, Mo.

OWL-INTEREST

Our calf No. C 2, dropped Dec. 25, 1917, is the result of 31 years of careful breeding and selection. He has 25% blood of Interested Prince, 58224, sire of Passport, the champion Jersey milker, 19,694 lbs. milk, 839 lbs. fat, and grandsire of Interested Jap's Santa, 13,308 lbs. milk, 805 lbs. fat, and The Owl's Princess May, 12,213 lbs. milk, 744 lbs. fat.

His sire:—Sibley's Interested Prince, has 6 daughters in the R. of M., one that has made over 70 lbs. fat in 1 month as a 3-year-old.

His dam:—Owl's Tones is entered in the R. of M. with 9,839 lbs. milk, 465 lbs. fat. Now on retest has given in 6 mos., 7,042 lbs. milk, 327 lbs. fat. For pedigree and price address
MOOSE HILL FARMS, SPENCER, MASSACHUSETTS.

The Fairview Farm Company
Sophie's Tormentor Jerseys

"Production" Our Watchword

FOR SALE—Bull Calf No. 244, dropped March 21st, 1918; solid color, black tongue and switch; an extremely good individual.

SIRE—Lass 64th's Son 106612, whose dam, Lass 64th of Hood Farm 266735, made 962 lbs. 85% butter in 1 year from 13,444.6 lbs. milk as a junior four-year-old. Grandson of Sophie 19th of Hood Farm, Hood Farm Torono and Hood Farm Pogis 9th.

DAM:—Tweedledum's Emma of H. S. F. 291389, on Register of Merit test and in 2 months has made 164.84 lbs. 85% butter from 3,151.1 lbs. milk. An exceptionally good dairy cow in every respect.
R. L. PIKE, President, - Geneva, Ohio.

Stock of all ages for sale. Seven yearling bulls ready for service.
FRED TSCHUDY & SONS, MONROE, WIS.

HOLSTEINS

A Rare Chance

To secure a few choice

Grade Holstein Cows

Just fresh and due within a few weeks. These cows were selected to furnish milk for a famous summer hotel which is soon to be turned into a Government Hospital. They are a very fine lot and will be sold in numbers to suit the buyer. There are only a few of this kind in New York State. Wire your arrival. Don't wait to correspond.
River Meadow Farms, Portlandville, N. Y.

Soon Ready for Service

Young Holstein bulls from good Official Record dams and sired by SPRING FARM KING PONTIAC 6TH. Fourteen of his first sixteen two-year-old daughters last winter each made better than 20 lbs. of butter in seven days; a showing never before equaled by the first two-year-old daughters of any other sire. These young bulls are nice straight, thrifty, desirable animals. We would be glad to write you full particulars. You will be surprised that our prices are so low for so much quality.
Henry Stevens and Son, - Lacona, N. Y.

HOLSTEINS

Carload Registered Springers.
Carload Registered Fall Cows.
Carload Registered Heifers Unbred.
Two Carloads Grade Springers.
Write your wants. Come and see us. Prices right. J. A. LEACH, Cortland, New York.

LAKESIDE HERD

For forty years this herd has taken the lead in breeding for the highest individuality, largest average production, 4% butterfat, greatest uniformity and prepotency, with the result that over four-fifths of all the cows which have made A. R. O. records of 30 lbs. or more, trace their pedigrees to the Lakeside Herd.
Breed this kind and get same results.
E. A. POWELL, SYRACUSE, NEW YORK.

You Can Still Get One But Act Quickly

Nearly all of our sons and grandsons of Pietertje Hengerveld Segis are sold. A few up to 11 months old from high record dams can be bought yet. Pietertje is the only bull living with 100 A. R. O. daughters and 55 sons. He is the best Segis sire living. Prices to suit you.
Susquehanna Farms, Hartwick Seminary, N. Y.

Your Last Chance! To Get a Son of The World's Greatest Sire
KING OF THE PONTIACS

We have only a few left. Here is a beauty born April 20, 1918, about three-quarters white, out of an 18.82-lb. three-year-old whose sire is a $4,000, 40-lb. grandson of King Segis. Think of this combination of breeding. King of the Pontiacs and King Segis. First check for $500 takes him.
Geoffrey Burlingame, Cazenovia, N. Y.

Hazelhurst Stock Farms

Offer a Yearling Son of King Segis Pontiac Canary who is a 30-lb. son of King Segis Pontiac. Youngster's dam is Hazelhurst Rouble Clothilde with 7-day record of 30.32 lbs. butter and 579.3 lbs. milk. His dam and sire's two dams average butter 7 days, 32.78 lbs. and for 30 days 126.54 lbs. He is nearly white, a fine individual and very straight. Priced for quick sale. Write.
H. H. Wickwire & Son, Hubbardsville, N. Y.

SHE IS A DAUGHTER OF Sir Pietertje Ormsby Mercedes, the greatest yearly record sire in the world, and from

MINNESOTA'S FIRST 1000-lb. cow, Riverview Fytje DeKol Ormsby.

THE YOUNG DAUGHTER of Sir Korndyke Fytje that we are offering made 16.66 lbs. butter in 7 days at 24 months of age.

SHE WILL FRESHEN early in November to the service of King Piebe Ormsby Mercedes, a young bull whose dam made 35 lbs. in 7 days and 1,136 lbs. in a year at 4 years.

HIS THREE NEAREST DAMS average 32 lbs. butter in 7 days and 1,040 lbs. in a year at an average age of 4 years.

SHE IS A SPLENDID heifer for type and size and will make someone a great foundation cow.

THE DAM OF THIS HEIFER made 26 lbs. in 7 days as a junior four-year-old and has a full sister with 26 lbs.

SHE IS SIRED BY Changeling Butter Boy 7th and from a 24-lb. daughter of Queen Piebe of Fairview, one of our greatest foundation cows.

QUEEN PIEBE OF FAIRVIEW made 22 lbs. in 7 days several years ago.

AMONG HER GREAT DAUGHTERS is Queen Piebe Mercedes, 1,389 lbs. butter and 30,230 lbs. milk in a year as a junior four.

THESE ARE BOTH WORLD'S records for her age and no cow, regardless of age or breed, can equal both her milk and butter production.

IF YOU ARE IN THE MARKET for females you want the blood that has produced winners. The pedigree of this heifer contains some of the greatest producing dams and sires in the world.

$750.00 BUYS HER—GUARANTEED SOUND.

HOLSTEIN-FRIESIAN ASSOCIATION OF AMERICA, Box 101 Brattleboro Vt

A National Asset

THE Banks of your town—and of every other farming community—are the greatest evidence of our National Assets. They *store* your money, the product of your labor, your live stock and your land.

But more important than mere money are the farms themselves and the modern equipment that makes it possible to produce more crops per acre, more dollars on less land. These are the Nation's *real assets.* These are the things that make ours the richest nation in the world.

The Empire Milking Machine is one of these National Assets. It enables the dairy farmer to harvest more milk at less cost. It conserves man power: one man with the Empire Milking Machine can do the work of three or four hand milkers—better and in the same time.

Empire Milking Machines produce cleaner milk (worth more money): for they take the milk from the cows as nature makes it, without an instant's contact with the stable air or other impurities. Their gentle, even, massaging action soothes the cows and makes them better producers —it usually lengthens the period of lactation.

The Empire is the Recognized Standard Milking Machine —ask any Empire user.

The Empire is a National Asset. *More* than that: it is what your banker would call a LIVE ASSET, an asset that produces additional wealth. Its value is not "what it costs" but "what it will earn for you". Considered that way its cost is too small to think of.

Let this National Asset add to your milk check—give the Empire a chance to increase the productivity of your dairy. Call on the Empire Dealer or write for Catalog 31 at once.

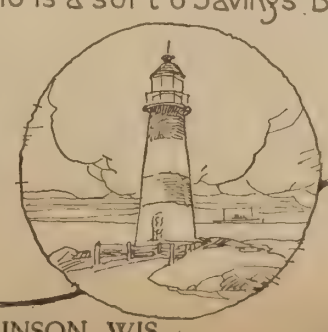
The SIGNAL OF THE SILO



W. Livingston Larned

The Dutch are known for Windmills, grinding out their daily bread
Each white arms, like to feathers, on some giant Injun's head.
And--where you see them turning, it's a sign of happiness--
Of thrift and wealth and labor and th' swish of fortune's dress.
Here--in canals of clover and by dykes of golden grain,
We hear our own hearts bumping to the joy of toil, again,
And Silos, white and gleaming, silhouette against th' sky,
Chockfull of food fer cattle, they'll be munchin' bye and bye.

The sea boasts prim light-houses, perched along the stormy shore,
To guide th' wind-tossed sailor, when his own eyes see no more;
Whilst we--we of the inland, have our Silos standin' guard
Through snow and rain and winter, with its fists a-beating hard.
And, somehow, we compare 'em, in a tidy sort of way,
With them as stand out yonder, where th' ocean roars, today.
Th' treasure-trove of cattle that are hungry with the morn
A storm-bound Silo, standin' in a restless sea o' corn

And whether made of cement, or stave, or iron, or tile,
Or woods of all creation, from up Maine ways to th' Nile,
Or whether concrete fellers get th' local upper-hand,
God bless 'em--they're ALL Silos, for th' better of th' land
A munch of tasty silage, makes th' Dairy records grow:
Who gives a hang for feed-bills and a winter full of snow
Th' herd is plump as butter...and if folks have cause to thank
It's because each farmer's Silo is a sort o' Savings Bank!

Subscription agents for Australia—Australasian News Co., 226 Clarence St., Sydney, Aust.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $2.56, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of the Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome immoral and quack advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Butter and Cheese for the National Dairy Show

Now is the time to be making cheese to go into storage to be getting ready for entry in the exhibit of dairy products that is desired for this year's National Dairy Show.

The educational work of the Show this year is to be conducted by federal government experts along lines of production and consumption of milk and its manufactured products. The form of effort to be advanced is a showing of the vital need of milk for babe and infant as well as adult life, and to impress upon the consuming public how possible it is to completely sustain life and vigor on dairy products alone, also to impress upon the dairy people the absolute necessity of maintaining and building up the dairy industry to the fullest possible extent. It is thought this would be best emphasized by an exhibit of such magnitude that it would aid in crystallizing the thought of the immensity and value of this great industry. Every butter and cheesemaker who desires to aid in such a laudable effort and at the same time advertise his make should write the National Dairy Show, 130 No. Wells St., Chicago, for prize list and entry forms.

The state sending the largest number of exhibits will receive a silk and gold banner and a gold medal goes to exhibitor receiving the highest score.—Publicity Department.

"Putting shock corn in the silo," says Professor Eckles, "makes satisfactory silage, but not as good as silage from corn put in at the proper stage. It is not a practical thing to do except on farms where a water [illegible]m makes it possible to add the [illegible] amount of water and to do [illegible] the corn goes in. The [illegible] be added should be [illegible]und for pound

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

Wanted:—Position on a dairy farm. By a young college man, who will work during the remainder of the summer. Am not afraid to get up at five and stick on the job until ten at night. Do not smoke, drink, or chew. Have no bad habits. Like cows and am a quick learner. Have no desire to spend my time in the village. Do not expect large wages to begin with. Content to sleep in garret or even in barn. Willing to learn. Anything that's grown about the place is good enough eating for me. Will pay my own expenses to place. K. B. R.

And nobody answered the advertisement—they thought it must be a joke.

Content on the Farm

Mother's more than happy at her farm chores, nowadays;
Goes about it singing while th' shiny motor plays.
Wired the whole place, Mister—brought it strictly up to date;
Press a button—Presto! Mr. Edison, you're great!

Mother does her washing by the motor-driven plan,
Mother sharpens scissors like th' city fellers can.
Mother does her churning with a lever and a spark!
Mother lights the dairy in a jiffy, when it's dark.

Say, it's fun for women! This electric-driven scheme!
Sweep with it and cook with it and freeze a quart of cream!
Home is filled with singing and th' grub is never late.
Press a button—Presto! Mr. Edison, you're great!

At the Cantonment

Camp Cook:—"How is that for milk, eh?"

Private Snuggins:—Raised on a dairy farm—"All I can say is that the cow that gave it was sired by a pump."

Joy on the Ear

The time is almost here,
When a feller can get
His corn on the cob,
And can dab it all over with butter
And dive into it,
Until his ears are as slick
As a new milk tin.
Of course,
You know and I know
That more than likely
They serve us up common
Field corn
Meant for cattle,
And it's tough, and mealy
And wasn't intended
To be eaten by humans
On the cob at all.
But when you get a real
Roasting ear, all plump
And mellow and sweet,
Isn't it the most heavenly taste
On earth?
Oh, those poor deluded mortals
In town,
Who cook up the field ears
Under the delusion that
It's Country Gentleman
Or Golden Bantam!
May they live to come out
To the farm
And have a real cob
Of real corn.

I know a farmer who had a prize hog and he built him a concrete pen and gave him patent back-scratchers, and scrubbed him twice a week, and mixed his diet scientifically, and planted sunflowers all around the pen, and combed his bristles out—but he was still a hawg!

"Oh, mother!" called little Ella, six years old, as she looked into a pan of milk that had been standing over night, "The marigolds that the bossy ate has all come to the top."

THE

NEW DE LAVAL

CREAM SEPARATOR

Will Give You

Greater Capacity, Longer Wear, Better Service, Bigger Value

THE bowl of the New De Laval has greater capacity for a given size and a given speed than any other. The experience of thousands and thousands of users has proved that a De Laval will outlast and outwear any other make.

Look well to service when you buy a cream separator. That means more than anything else. That should include not only a good working and reliable machine, but the right sort of attention and interest on the part of the seller, not only at the time the machine is set up but as long as you continue to use it. De Laval service is well known. You can depend upon it.

Value depends upon the amount and quality of service the separator gives you—what you get out of it. You get more value for your money when you buy a De Laval, because it will give you more and better service than any other separator.

Order your De Laval now and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or if you don't know him, write to the nearest De Laval office as below.

The De Laval Separator Co.

165 Broadway, New York 29 E. Madison St., Chicago

Resolve to Build a Silo

ALTHOUGH the silo propaganda has been continued for more than a quarter of a century and although the merits of silage as a feed for dairy cows has been fully demonstrated for these many years, yet there are many farmers who at the present time are soliloquizing as to whether "to build or not to build a silo this year". All the force of argument would seem to indicate favorable action, yet amidst it all there is confusion as to whether it will really prove profitable and more confusion as to the particular type of silo. Decision is the trait of the good business man, and for the farmer the decision to build or buy a silo is more important than decision as to the kind of silo.

Will it Pay?

Will it pay? It is generally recognized and accepted that silage is a good feed for dairy cattle; it is palatable and succulent; it has an excellent effect on the digestive tract; and it supplements legume hay in such manner as to make it an ideal ration and one with which almost any combination of available grain feeds may be used. But, will it pay? Does its cost overbalance its benefits?

There is much that can be said on this subject, but probably the best argument is that practically every successful and prosperous dairyman has one or more silos. It is safe to say that there are over 400,000 silos that proved their worth last winter in reducing feed bills and increasing milk yields. Figures of profit could be quoted, but after all the general adoption of the silo by the best farmers after 40 years of experience is most convincing proof that it is a profitable investment. However, it might be well to cite a few of these reasons.

The silo is the best and cheapest form of providing succulent winter feed. It is the cheapest farm building we can erect. It will house feed nutrients at a lower cost per ton than the hay mow in the barn will protect like feeding value in the form of hay or other roughage from the weather. It increases the producing capacity of the farm at least 10 per cent, and will often increase its stock carrying capacity 25 per cent. It is the cheapest place to store the corn crop, for an acre of corn can be placed in the silo at a cost not exceeding that of shocking, husking, grinding, and shredding, and it will preserve more feed nutrients and produce more milk per acre than any other system of handling. It saves a third of the value of the corn crop that is otherwise largely wasted. It requires less labor to feed silage and there is less waste of fodder by the cows. It is the cheapest and most convenient method of soiling.

The Kind of Material to Use

Having decided that we shall erect a silo, the next question is the kind of material to use. The writer could state his own personal preferences, but he finds that the man next to him has as other preferences. Both realize that with silos, as with machinery, only general principles may be laid down. If the manufacturer has followed these, then the decision is up to the farmer. In the building of a silo there is a choice of materials, different methods of erection, various types of doors, different forms of roofs, etc. However, there are certain fundamentals that should be considered.

Experience has determined that to be a good storage for feed a silo must be an air tight, water tight tank reinforced sufficiently to prevent its spreading, and with smooth, plumb walls; that the circular form or a near approach to it is the best; that it must be of the right diameter to provide the daily feed without spoilage and that it must be of sufficient depth, say two to three times its diameter, to secure economy in capacity, a good quality of silage, and a sufficiency of feed for the year. These are fundamental requirements, all other matters are of relatively minor importance.

There are instances where it will be better and cheaper for the farmer to construct his own silo, but in the well established dairy sections the time is past for cheap construction and temporary buildings. The log cabin, the small frame house, and the old type of barn all have their time and their place, but the area has come, or is coming, in the prosperous dairy communities when we must have some regard for asthetics and the amenities of life on the farm. Makeshift buildings do not satisfy. We should provide for permanency and buildings that beautify our farmsteads. This applies to the silo, as it does to the farm home, the barn, and the farmstead as a whole.

Size of the Silo

Having decided to build a silo and having determined the kind to build, the next question of importance is the size of the silo. The first consideration is to know the minimum daily consumption of the live stock to be fed, and this can be readily computed with the aid of the following table:

Table I. Showing the amount of silage usually fed to different kinds of stock on full feed.

	Lbs.
Dairy cattle per 1,000 lbs. live weight	30
Beef cattle per 1,000 lbs. live weight	30
Horses per 1,000 lbs. live weight	20
Dairy cattle, supplementary to pasture	15
Sheep, per head	2

Silage is more compact in the bottom of the silo than in top, and the weight per cubic foot increases with the depth. In a silo containing thirty feet of silage the weight per cubic foot will vary from about 18 lbs. at the top to 56 lbs. at the bottom, but the average will approximate 40 lbs. Table II is based on this average, and this fact should be taken into consideration in using the table to determine the diameter of silo:

Table II. Showing Relation Between Size of Herd and Diameter of Silo

Diameter of silo Feet	Weight of layer 2 inches deep Lbs.	Number of stock this layer will feed, allowing per head: 40 lbs.	30 lbs.	20 lbs.	15 lbs.
10	523	13	17	26	35
11	633	16	21	32	42
12	754	19	25	37	50
13	885	22	29	44	59
14	1,030	25	34	51	69
15	1,178	29	39	59	79
16	1,340	33	44	67	89
17	1,513	38	50	75	101
18	1,685	42	56	84	112

The diameter of a silo is determined by the size of the herd or the daily requirements. Too large a diameter for the stock to be fed means waste and spoilage of silage.

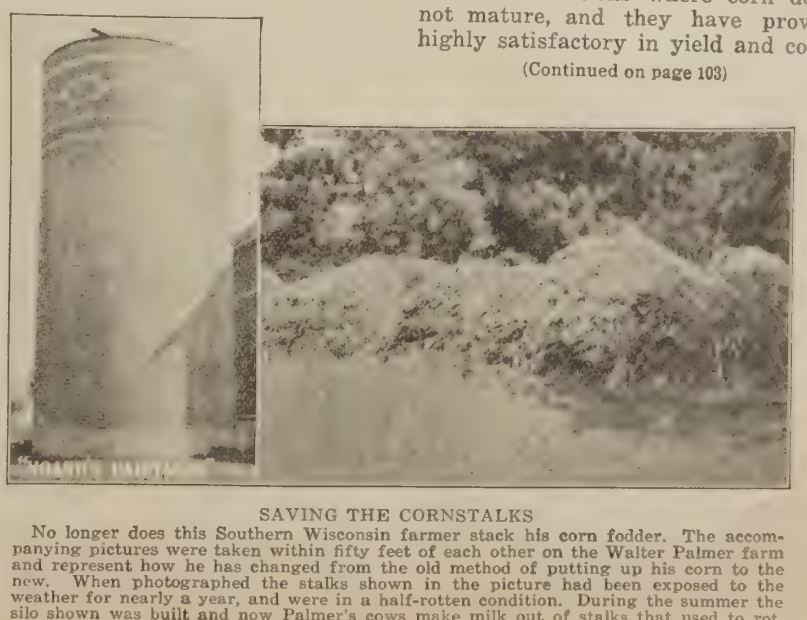
The height of the silo is determined by the length of the feeding period or the annual requirement and may be computed by the use of Table III. A high silo gives greater compression, which means that the air is more thoroughly excluded with a resulting better quality of silage; it also means the storage of more silage in a given space. The height should be from two and one-half to three times the diameter for best results, and it is well to set the minimum at 28 or 30 feet.

The Machinery to Use

Having decided to build and having built the silo, the next question of importance to consider is the machinery with which to fill. We are already provided with the corn harvester, but unless there is a silo filler and engine in the neighborhood we will have to buy one. The present tendency is away from the larger outfit, and possibly the most economical method, for the man with 20 to 30 cows or less, is to join with three or four neighbors in the purchase of the necessary equipment and in exchanging work at silo filling time. Write the manufacturers of these supplies who advertise, give them the number of silos to be filled and their size, ask them as to their recommendations as to the best outfit to meet your particular need, and then make a decision giving due regard to quality as well as to price.

The Kind of Crop to Ensile

We are now fully prepared as to facilities for storage, and all that remains is to supply the silage crop. In those sections where corn will make a good crop, it is to be preferred for silage.



Next in importance as silage crops are the sorghums, both the sweet and the grain sorghums, which are particularly adapted to some of the southern states and to certain other sections of the semi-arid Southwest. North of the corn belt the grains and some of the legumes are much used for silage, as they are also used as substitute crops when corn fails or when additional feed is needed. In a recent survey we found oats and peas were used in practically every state as a substitute crop, but we apprehend that wheat or other grains, either combined with legumes or alone, are in greater use where corn or the sorghum cannot be relied upon. However, alfalfa, sweet clover, and common clover are largely used, and as more knowledge is gathered concerning correct methods there will be an increase in their use.

Sunflowers have been ensiled alone in certain sections where corn does not mature, and they have proven highly satisfactory in yield and com-

(Continued on page 103)

MEN AND TEAMS ARE KEPT BUSY ON THE FARM OF J. A. BOYD, INDIANA, WHEN FALL COMES AND THE CORN CROP MUST BE PLACED IN THE 18'x40' TILE SILO

SAVING THE CORNSTALKS

No longer does this Southern Wisconsin farmer stack his corn fodder. The accompanying pictures were taken within fifty feet of each other on the Walter Palmer farm and represent how he has changed from the old method of putting up his corn to the new. When photographed the stalks shown in the picture had been exposed to the weather for nearly a year, and were in a half-rotten condition. During the summer the silo shown was built and now Palmer's cows make milk out of stalks that used to rot.

Dairy Feeding to Meet Present Conditions

B. G. SOUTHWICK, Massachusetts

PROFITABLE feeding of the dairy cow should always be based upon a proper adjustment of feed cost, in labor and money, to production and the value received. All concentrates are much higher now than in 1916, while labor is not only higher but more scarce. With these facts confronting the eastern dairyman, what has he done to adapt his feeding practice to present conditions?

In the spring of 1917 a study was made through all New England for the purpose of learning what it had cost the previous year to produce milk. This study included the twelve months from May 1, 1916, to April 30, 1917. Needless to say, results in the different states varied and the values or money costs mean little now because prices have risen. However, the amounts, or quantity figures of milk produced, grain, succulents, and roughage fed are still valuable, unless existing conditions have changed the feeding practice.

Feeling that some verification of the previous study was desirable, a small number of Massachusetts dairymen were visited in May, 1918, and records of their cost of milk production secured. A comparison between the two years indicates the trend of feeding practice, and is more valuable than the cost in dollars.

The following table shows the results on the same Massachusetts farms from May to May in each case:

Same Group of Massachusetts Farms	Feed Used per 100 Lbs. Milk: Grain	Silage and Green Crops	Dry Roughage
May 1916-1917	48.5 lbs.	110 lbs.	97 lbs.
May 1917-1918	46.7 lbs.	104.1 lbs.	111.7 lbs.

	Feed per Cow 1916-1917	1917-1918	Increase	Decrease
Grain	2,430 lbs.	2,213 lbs.		217 lbs.
Hay	4,379 "	4,774 "	395 lbs.	
Corn stover	478 "	520 "	42 "	
Silage	4,098 "	3,673 "		425 lbs.
Green crops	1,408 "	1,260 "		148 "
Milk produced per cow	5,005 "	4,736 "		268 "

These are figures from only a small number of dairies and all the herds averaged in 1917 to produce less than 5,500 lbs. of milk per cow. They, nevertheless, represent cows of about average production.

The following conclusions seem justified: Dairymen have in the past year reduced those feeds costing the most money to buy and labor to produce. In proportion to the milk produced, grain is still fed rather liberally on these farms, but not as much as last year.

Hay Cheaper Than Silage

The reduction in silage fed was probably influenced somewhat by the early frost last fall, but, coupled with an increase in hay used, it points to a realization of labor conditions and feed values. It requires 3 tons of silage to furnish the same digestible nutrients to a cow that one ton of hay will furnish. Hence the question of farm labor to produce it is involved. Silage corn requires about six times the labor needed for an acre of hay and a comparison of the two is approximated by the accompanying table.

	Yield per Acre	Labor per Acre	Acres to Produce Equal Nutrients
Hay	2 tons	1 unit	2
Silage corn	12 tons	6 units	1

As six times the labor is needed for silage corn, any farmer who is not short of land, but is short of labor, can raise more nutrients with that labor in hay,—though he must harvest even four acres to equal the yield of nutrients from one acre of silage corn.

It is not the best feeding practice to use no silage but there seems to be no good reason, except shortage of land, for feeding more silage than hay. Apparently, dairymen are realizing this under present labor scarcity and adjusting their feeding practice to fit. At least the following measure of feeding efficiency indicates this conclusion:

Make Milk From Home Grown Feeds

Present conditions and costs of both grain and labor ought to convince the eastern dairyman that milk can be most economically made from home grown feeds. The practice of one Massachusetts dairyman, who made a profit last year of $55 a cow, illustrates this fact when compared with another man's practice who lost money on his cows:

Two Types of Dairy Feeding	Jones (He made money)	Smith (He lost money)
Grain (total)	1,642 lbs.	2,415 lbs.
Hay and stover	5,369 lbs.	4,000 lbs.
Silage and green crops	6,526 lbs.	5,434 lbs.
Milk per cow	5,435 lbs.	4,127 lbs.

The cows of these two men were probably not equal in producing capacity, but this emphasizes more strongly the necessity of feeding in proportion to production. Heavy grain feeding will not take the place of good cows.

Jones made money but he can improve his farm management. Last year he had practically no clover hay. He picked the ripe ears off the silage corn, and his only home grown grain was corn. With clover hay and oats to grind with the corn, he probably could have reduced the grain purchased. He robbed the silage of its mature ears in order to get the sensation of feeding the grain.

Economical feeding of the dairy herd in the eastern states ought to be based on: first, as much clover hay as can be grown and a liberal use of hay, whether clover or not; second, the use of silage from mature corn to supplement the hay, but not to replace it; third, all the home grown grain that can be raised including corn, oats, and barley; fourth, the use of purchased concentrates only to supplement the ration; and, fifth, feeding according to production secured.

The dairyman whose system of farming fits these first three requirements has a strategic advantage over the man who is largely "manufacturing" milk from purchased grain. Moreover, present conditions are forcing dairymen to this system of farm management, or forcing them to the wall.

Washington County, Minn., Guernsey Club

The annual picnic of the Washington County (Minnesota) Guernsey Club took place on June 12, at Lake Elmo, on the farm of Ed. Wiers.

The weather conditions were ideal and a large crowd of Guernsey breeders attended. R. A. Wilkinson of Lake Elmo was the first speaker of the afternoon. His talk sure was instructive as he touched upon numerous things that every one appreciated, including the Red Cross work throughout the country.

He was followed by Professor W. A. McKerrow of the University Farm and, as usual, his talk was featured by the strong interest the people took in it.

Professor Weaver, also of the University Farm, gave a splendid talk on feeding during war time when feed is so high and some of it scarce.

Mr. E. A. Onsrud, fieldman of the American Guernsey Cattle Club, then spoke and his talk was inspiring, as everyone rejoiced over the big advancement the club's business has made the past year. His talk put determination into the people that this year will again be a banner year for the Guernseys.

H. R. Leonard, assistant state leader of county agents, spoke next and surely made a hit, as the people all remember the good work he accomplished in this county when he was county agent.

Mr. A. G. McCormick, the present county agent, finished the very successful program by encouraging everyone to work all the harder as this war should not stop the Guernsey cow from staying on top. He made many new friends by his inspiring and encouraging talk.

The feature of the day was the sale of a beautiful yearling grade Guernsey heifer donated by L. E. Hageman & Sons for the Red Cross. H. R. Leonard wielded the hammer and after some very spirited bidding the heifer was finally sold to Professor W. A. McKerrow for the neat sum of $90. Master Herbert Hageman, dressed as Uncle Sam, held the heifer as she was auctioned.

Minnesota. L. G. HAGEMAN.

MASTER HERBERT HAGEMAN AND THE RED CROSS HEIFER SOLD AT THE WASHINGTON CO., MINN., GUERNSEY PICNIC TO W. A. McKERROW, UNIVERSITY FARM, MINNESOTA

Progress of a Pennsylvania Breeders' Association

HOARD'S DAIRYMAN:—On March 3, 1917, when the Grove City, (Pa.) Guernsey Breeders' Association first organized, there were only twenty-two pure-bred Guernseys belonging to the eighteen charter members of the association. Part of the members had no pure-bred Guernseys at all and all that induced them to belong to the organization at all was their interest in the breed and the hope that some day they would have one or more.

Today, less than eighteen months after the organization of this association, due to several influences, chief among which have been the activities of R. R. Welsh, extension representative of the U. S. Dairy Division, and to the financial and other encouragement of the Grove City National Bank, this young association has grown to a remarkable strength and activity.

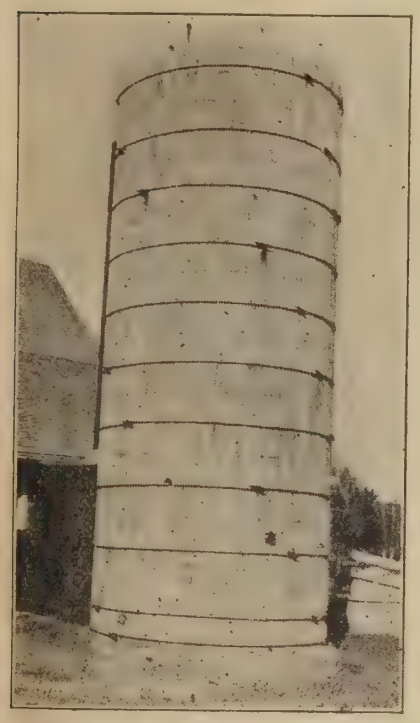
Today, instead of the original 22 pure-bred Guernseys of rather nondescript breeding as far as Guernseys go, this number through births and purchases has mounted until today one member alone has eighteen head of females. So great has been the interest in the breed that another of the charter members sold all his grade stock and used the money to buy a son of Galaxy's Sequel out of a dam with a record of over 500 pounds of fat. To go with this bull for a foundation of females he bought an imported cow and her daughter, both with good Advanced Register records. Still another member was very fortunate in buying a son of Molly Rose O. D. (leader in Class EE at the time her record was made) and sired by Anton's May King, the $7,000 bull. Another young breeder has a son of Anton's May King and out of a 500-lb. daughter of Begalore.

In regard to Advanced Register work one member has made application for this work to start with his herd in September and several others are trying their cows out in the local cow testing association preparatory to this work.

However, a far more important step has just been taken by the members of this young organization, probably the first of its kind in this country to adopt such a rule. At a recent meeting it was voted that a member either to become or to remain a member of the organization must sign up to have his herd tested for tuberculosis under the new "accredited herd" plan of the U. S. Bureau of Animal Industry. At the same meeting a uniform cash bull service fee was suggested and with it the suggestion was made that after each service the bull be flushed out to prevent the spread of contagious abortion.

With these two important measures and the good blood lines it is to be hoped that in two or three years when the members begin to have surplus stock for sale that the New England Guernsey buyers on their trips to buy Guernseys will at least stop among the members of this young organization.

Pennsylvania. HUGH FERGUS.



Which is the Best Silo?

JOHN BOWER, Minnesota

OF all the questions that are asked today of agricultural college, press, or lecturer, the question, "Which is the best silo", is one that is heard most often; in fact it is a vital one. The farmer who is going to build a silo, and no progressive farmer, or any farmer for that matter, can afford to farm without one, is confused by the kinds and conflicting statements of different silo agents. Tile, solid cement, hollow block, stave, cement stave, steel, one-piece or two-piece, fir, redwood, or cypress, single wall or double wall, ground silos, shiplap, and home-made,—it is enough to drive any man crazy. Indecision as to kind means lack of action and that means no silo, and the wonderful beneficial effects of the silo as a factor in feeding are lost.

Experiment Stations Add to the Confusion

Not only silo agents but even our colleges seem to stand sponsor for the different types. When we think of Wisconsin we think of the Gurler silo

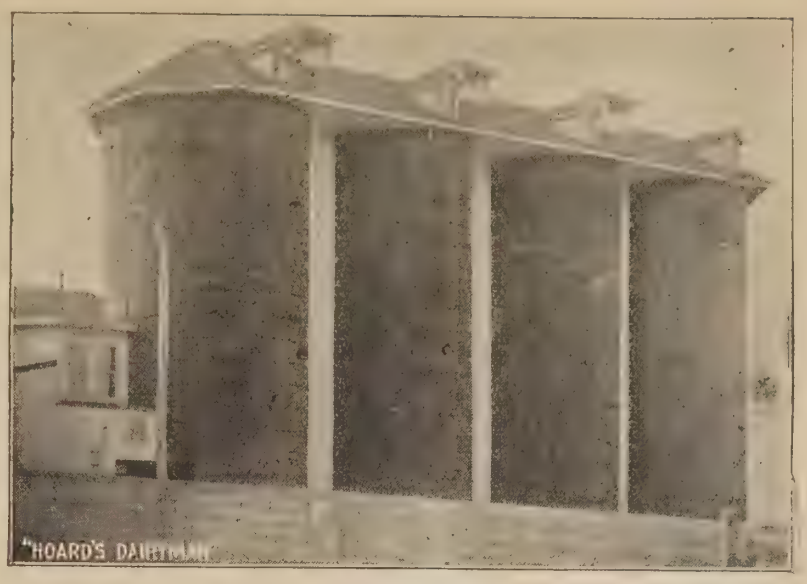
THE CEMENT STAVE SILO WHICH PAID FOR ITSELF IN TWO SEASONS
OWNED BY W. J. TEMPLE, NEBRASKA

with its 2-inch by 4-inch studding and shiplap inside and outside. When we think of Indiana, we see the solid cement wall reinforced with steel and forms for building same. Come over to Iowa and the hollow clay tile and Iowa station seem closely associated. When you go down to Kansas the station there advocates and aids in the construction of the plastered steel silo. Steel frames were erected and heavy steel woven wire interposed and plastered two inches outside and inside with cement plaster. No wonder the farmer is confused.

Even he has not been idle and we find 2-inch by 4-inch studding nailed upright with heavy tar cord between. We find the hole in the ground, we find a modification of the Gurler silo, and a few other types. Usually such a builder is conscious of the great merits of his silo, and it gets quite a publicity beyond his own community. Bankers, merchants, travelling men, and others realizing in a vague way that here is something of merit, urge the building of silos, but confuse the farmer with a lot of advice often as wordy as useless.

What Constitutes a Good Silo?

Now let's sift some of the main facts of silo construction out of the mass of unimportant matter. What do we want? What are the essential needs? What shape? What height? We want a building that is air-tight and will remain air-tight; we want one as cheap as we can get it if it is right; we want a silo to last at least our lifetime; we want one that will give us as little care as possible or low maintenance; we want a continuous door; we want those doors, like any other doors, on hinges; we want a good ladder; we want smooth walls and at least height enough to lessen percentage of waste on surface to the smallest per cent practically possible.



The Home-made Silo

Of all silos that have given the least satisfaction, the home-made silo and the hole in the ground are the poorest. The only other silos, perhaps, were the square or rectangular silos which were first built. There is no question but that the round silo is the best silo shape and no other shape should be built. There was too much waste in the square silo and it was too expensive per unit space, and generally unsatisfactory, with bulging walls and spoiled ensilage. Of the home-made types, some are fairly satisfactory but too often they were not well constructed, and as a general proposition it does not pay a farmer to erect his own silo either of wood or cement. The main objection to the underground silo is that it is more costly to build. In many cases they are faulty in construction. The chief objection is the added cost in labor, with engine or horselift to daily get the ensilage out of the silo. It might be all right for the day, but it becomes a real burden as the days and years come and go.

[Mr. Bower's statement relative to the value of pit silos applies in those sections where there is a great deal of water in the soil. Where soil conditions approach those of Western Nebraska and Kansas, for example, the underground silo is being used to advantage. A number of simple mechanical hoisting schemes have been used so successfully as to greatly lessen the objection to lifting the silage out. Some of the advantages claimed for pit silos by those who use them in sections in which the soil is adapted to them are: (1) They cost very little, enabling men to own a silo who have not the necessary capital for an above-ground silo, (2) less power and less equipment is needed at filling time as no blower or carrier is used, (3) no trouble is experienced with frozen silage, and (4) pit silos do not blow over.—EDITORS.]

DIGGING A PIT SILO
The simple hoisting derrick shown here can be used for elevating the silage after it has served its purpose in the construction of the pit silo.

BATTERY OF FOUR STAVE SILOS USED ON THE FARM OF JAS. HEACOCK & CO., PENNSYLVANIA

Objections Raised to Stave or Wooden Silo

Talk to a cement, tile, or any mason constructed silo salesman and one would think that all you have to do is blow good and hard and the modern knock-down stave silo would tumble down in a million broken pieces and that the farmer who owns one spends two-thirds of his time tightening hoops. Nothing could be further from the truth. The writer has traveled over four states, has seen numbers of silos, and so far has seen but three silos on the ground. Two of them were eighteen feet in diameter, and in the other case the storm was of such violence as to damage other farm buildings. The staves did not seem to be at all damaged but the hoops were badly twisted. The modern stave silo, painted and properly anchored, is just as permanent a structure as any other farm building, the tightening of the hoops is no burden and its life is much greater than the life of the average farmer on the farm. Any farmer who erects such a silo can be assured that he has something which is absolutely right.

The Mason Constructed Types

Of these the most common are the clay block or tile silo, the cement block, the solid wall cement, and the brick. Occasionally we find one of stone. To listen to some of the stave silo agents there really is no real good in any of the types. They crack open so that one can "throw a cat through"; if cement, the cement peels off, the silage doesn't cure, and when the silage freezes it never thaws out till the middle of June. Don't believe it. When built right, they are right. Some few do crack, some cement ones crumble, and one finds frozen and poorly cured ensilage in some, as in the stave. Erect them properly, absolutely air-tight with smooth walls, and as good ensilage can be made and is made as in the best of the wooden types.

At the same time there is not the weight of argument for them as would appear on the surface. Permanency will have to be conceded. For the same reason we should build all farm buildings by mason construction and the silo does not lend itself any better or as well to mason construction as does a barn. A silo 14 feet by 34 feet, a common size, means building a wall nearly fifty feet long and thirty feet high with lateral pressure of quite large proportions to be considered. There is not one country mason in ten who thoroughly comprehends the need of such a structure, either as to foundation requirements or pressure effects. The writer would prefer to contract the erection of such silos to responsible firms who made a business of such erection, inserting in the contract a clause whereby the owner would be recompensed should cracks appear or cement scale off on account of poor workmanship or material.

Shall We Build Silos Frost Proof?

So much rubbish and misinformation has been talked about frost that certain farmers favor certain silos and even would build special types to prevent freezing. These are usually built at an extra cost. They might as well save their money. Have doors on hinges, keep them shut, put on a roof, feed a little lower near the wall, put silo on protected side of barn and you will have no frozen ensilage. A silo wall does not have to be thick to be good. A two-inch wood stave is as satisfactory as one ten times as thick. The more important point is to have air-tight walls.

In regard to height, while height is desirable from most every viewpoint, it is not as essential as is so much advocated. As good ensilage is found within two feet of the surface as further down. No matter how high, there will always be some silage one, two, three, and more feet below surface. The higher the silo the greater the tonnage that can be compressed into the lower part of the silo. A silo should be at least thirty feet high. Thirty-five or forty would be better. The per cent of waste on top is smaller in the higher silo. In width, sixteen feet is the maximum. Any greater width means double handling of silage to get it to the chute and in stave silos makes the circumference so great as to lose its strength or soli-

Babcock Milk Tester Complete $9.00

Any Cow Owner Can Make Accurate Milk Tests With the Efficient and Simple Crepaco Babcock Milk Tester

There is nothing intricate about it—operated by hand. There is a size for every dairy, from the 2 bottle tester to the large size with 24 bottle capacity.

This tester is noiseless in operation, the high speed being attained without unnecessary friction, by means of a spur and worm gear with cut teeth. The full instructions which are supplied with each machine tell you how to make accurate milk tests.

Crepaco Babcock Tester complete with glassware as illustrated above—six bottle capacity costs only $9.00.

We have Babcock Testers as small as the 2 bottle size costing $4.25 complete with glassware.

Our big Dairy Catalog describes fully, all size Milk Testers and other appliances of value to the dairyman. Write for it TODAY.

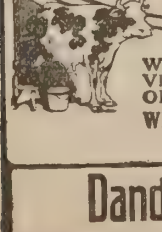
THE CREAMERY PACKAGE MANUFACTURING CO.
68 W. Kinzie Street, Chicago, Illinois

Summer Time is Buttermilk Time

KLEEN KUP

There's a booth in the Reading Terminal Market, Philadelphia, where cultured buttermilk is sold daily, direct from the farm. Crowds swarm about the counter through the long, hot summer days, slaking their thirst with this delicious, satisfying and nourishing drink.

It will *pay* you, whether dairyman or milk dealer, to make a specialty of buttermilk during the hot weather months. Serve it to your trade in the neat, appetizing KLEEN KUP—"The Package of Quality for Foods of Quality." Use Kleen Kup packages, too, for marketing fancy butter, cottage cheese, cream, etc. They are attractive, non-breakable, inexpensive. Used by over 4000 dairymen.



Look into this money-making proposition. Write us for Kleen Kup samples and the Kleen Kup story—*free*.

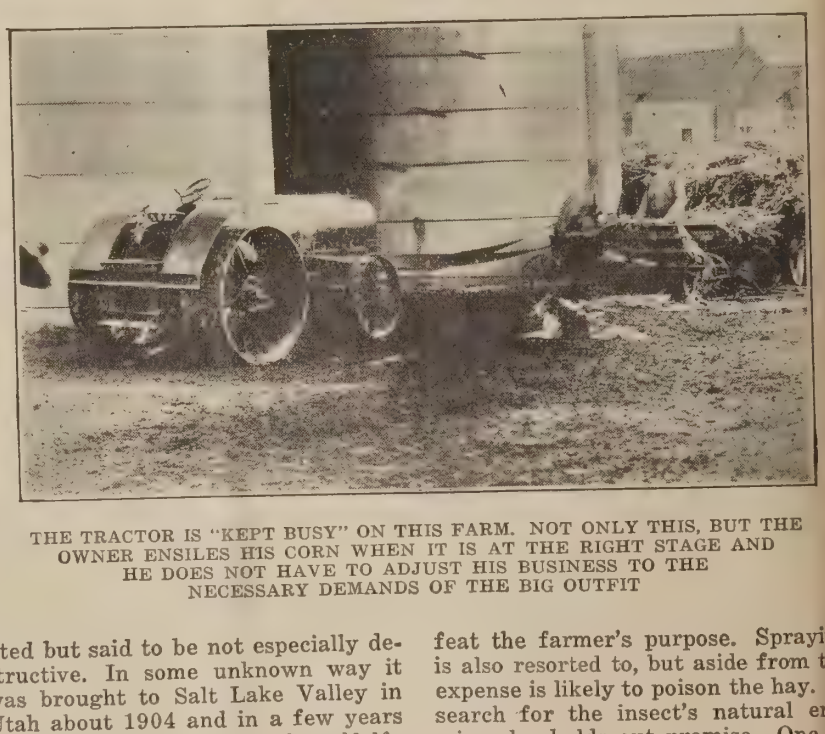
Idaho Alfalfa Notes



J. F. BRUINS, IDAHO

THE worst news that dairymen of this section have heard for some time is that the alfalfa weevil had become established in our neighborhood. This insect has a record of destructiveness in the Utah meadows that the German army might regard with professional envy but we had not given it much attention, believing it was several hundred miles away and for an indefinite time to come the other fellow's problem. Now, however, it has turned up securely established in the Payette Valley of Southwestern Idaho, a jump of almost the entire width of the state. Further, the government entomologists give us the not very cheering assurance that it may very likely be present in other localities where it is not yet noticed.

The Weevil Advances

This pest is one of the worst with which western agriculture has had to contend and as it gives no signs of halting its steady march into new fields its final result will probably be to raise the cost of producing dairy products everywhere. It is a native of Europe where it is widely distributed but said to be not especially destructive. In some unknown way it was brought to Salt Lake Valley in Utah about 1904 and in a few years wrought such havoc in the alfalfa fields that the culture of this plant was practically abandoned and hay became almost double its former price. The insect is small and inconspicuous so that it generally escapes notice until it is well established, after which it operates with thoroughness and completeness. The weevil itself is a bug about ⅛ inch long. During the first warm days of spring it sets to work in the alfalfa fields and as the shoots appear the female lays eggs in punctures in the young plant, generally several hundred altogether. After a short period of incubation these hatch and the larvae come out to feed on the growing plant. Mostly they attack the upper part of the shoot and when numerous enough cause it to wither and stop growth. A bady infested field at this stage looks as though frosted and may as well be cut at once as no further growth will take place. After the first cutting is removed the worms drop to the ground and feed on the young shoots as fast as they appear. This continues for several weeks while the field remains bare and brown. Then they spin cocoons and pupate, giving the plant a chance to make a growth for the usual third cutting. In about ten days the adult bettle emerges and either feeds there for the remainder of the season or makes a flight to new fields. The alfalfa plant is not killed but if no remedial measures are taken it becomes unprofitable to raise alfalfa at all.

The remedies at hand are so far inadequate but at any rate hold out some hope for our favorite forage. They are of course based largely on the insect's habits. One is to stimulate the spring growth of the alfalfa by early cultivation with a spring tooth or disc harrow or by topdressing with manure. This will hasten growth and give the plants a chance to form a first crop before the damage becomes too severe. Then when the first crop has been removed the ground is allowed to become dry and the field is thoroughly dragged with a brush drag. This brushes the insects off the plants and if the weather is hot and dry most of them will die in the hot dust. Then the water is turned on the field again and the second crop is brought on in comparative freedom. Obviously this remedy will not be so applicable to humid sections and cool and wet weather at this stage will defeat the farmer's purpose. Spraying is also resorted to, but aside from the expense is likely to poison the hay. A search for the insect's natural enemies also holds out promise. One of these is an Italian wasp which is said to be very destructive to the larvae of the weevil and is said to increase fast enough itself to be of real help. Toads, frogs, and birds are also helpful but are generally not equal to the size of the task.

THE TRACTOR IS "KEPT BUSY" ON THIS FARM. NOT ONLY THIS, BUT THE OWNER ENSILES HIS CORN WHEN IT IS AT THE RIGHT STAGE AND HE DOES NOT HAVE TO ADJUST HIS BUSINESS TO THE NECESSARY DEMANDS OF THE BIG OUTFIT

Up to recent years the insect had not traveled at a very rapid rate. Generally it had spread out at the rate of about 10 miles a year and had apparently made little use of artificial means of transportation though it traveled fastest along main wagon roads. It is not known by what means it made this long jump. It has made another, however almost as long from Utah to Delta County, Colorado, so that its extreme range is now almost 800 miles. Government entomologists say there is no reason to believe it will not eventually be distributed over the entire country. Unfortunately it is not known just how it travels so that although there are various quarantines in force against the regions of known infestations there is no real assurance that they will prove effective. It is, of course, hardly necessary to point out the moral of the old danger of heavy reliance on one crop. In this case the weevil attacks seriously only the alfalfa plant. We have left the clover

peas, and vetches among legumes and the silo as our ever present help. We will mourn our loss but may thriftily lay by a bit of insurance.

Hay growers, meaning thereby alfalfa farmers of this section, gathered in convention to the number of almost 1,000 lately to discuss the price of their product to consumers, mostly wool growers and dairymen. As this is a leading exporting section for hay their deliberations should have an outside interest as well. The price arrived at, $17 per ton in the stack, was determined on by comparing the average cost of hay during recent years with the value of product of consuming industries during the same years and then applying the same ratio between the present price of such commodities and that of hay. According to the figures of the state farm markets director, the selling price of mutton has increased 292% since 1914, wool 177%, dairy products 65%, and beef 33½%, while hay during the war period had risen about 115%, being generally valued before the war at about $7 per ton in the stack. The price of $17 seems to be generally satisfactory to all except the sheep men who protest violently that all other expenses have risen in cost even more than the value of their product. Hay growers have, however, led a rather precarious business existence. In this country one will find wealthy sheepmen, cattlemen, and even general farmers but the opulent hay grower has not yet become numerous. In some years, notably in the Twin Falls section of Southern Idaho, prime alfalfa has sold at $3 per ton in the stack and it has rarely gone above $7 or $8 in normal times. In 1916-1917 a severe winter and a short crop sent prices to unheard of levels in the spring, $20 to $30 per ton being common; but hay was not to be had at any figure and as farmers had generally sold out earlier few profited by the abnormal prices. The next year, however, the growers whetted their knives and went out to skin the sheepman, with the result that the latter imported thousands of dollars' worth of cottonseed cake, added to which the exceptionally open winter required only light feeding and a large proportion of last year's crops is still in the hands of the growers after much of it was sold at $8 to $10 instead of the $18 to $20 they had expected. The same old moral applies of course. If these growers had had dairy cows they could not only have marketed that hay at a handsome profit without worry as to cars or markets but would have greatly enriched their lands besides. It is experiences of this sort that will bring the cow more and more into favor.

Setting a Price

FREDRICKA DEKOL 75848, A RECORD PRODUCER AMONG AGED COWS
As a 14-year-old, she produced 24.72 lbs. fat (30.9 lbs. butter, 80% fat) in 7 days.
OWNED BY THE MAXWELL FARMS, IOWA

Dairymen of this section are somewhat puzzled as to what their grain ration will be the coming winter. During previous years it has been mostly rolled barley and "mill feed," the latter containing a large proportion of middlings or sometimes the thrifty miller ground bran fine to resemble shorts. At present both these feeds are almost unobtainable and it is not likely that even with the resumption of milling with the new harvest the wheat by-products will supply the demand. The most hopeful substitute is dried beet pulp which is in great favor and with the rapid extension of the western sugar beet industry should greatly assist the dairyman's need for a grain ration to supplement a leguminous hay. Unfortunately for dairymen beef cattle interests have instituted large feeding plants at most of the factories and the sugar manufacturers have little incentive to seek outside markets for their by-products. As matters stand almost the only dairy feed on this market is largely a beet by-product. The analysis shows a high starch content and low percentage of crude fiber, but as dairymen generally express doubt as to the feeding value of this mixture one is led to suspect that the analysis favors the feed somewhat and that the cows are too unlettered to produce according to its alleged value.

Grain Feeds Scarce

In conversation recently with Mr. McNair, county agent for Twin Falls County, Idaho, he related some of the results of sales of cows in his territory. This contains the only active cow testing association in Idaho, the Buhl Pioneer. Mr. McNair states that grade cows sold at these auctions as high as $600; that buyers came in from other states and made such bids hardly looking at the cows but depending solely on their association records. Also that the average sale price of cows in the association was from 50% to 100% over that of cows owned outside, similar but untested.

Tested Cows Sell High

Get 120 Eggs a Year

The average novice can reasonably expect to get an average of at least 10 dozen eggs per hen per year from his small flock in the back yard. There is nothing difficult in the care of the small flock if the important things are done at the right time and in the right way, and the system involves nothing too hard for a child given proper directions.

The ordinary material used on the inside of concrete silos is a mixture of cement and water. This mixture is made about the consistency of thick cream. When this is put on the inside surface, the concrete walls take up but very little, if any, moisture from the silage.

SHARPLES

TIME

The value of time has increased so greatly in recent years that those engaged in the business of producing milk or its products are no longer content to do slowly what can be done quickly.

In many ways they demonstrate this fact, but no where is it more plainly evident than in the cleaning of their utensils and equipment where an effort to save all the time possible, invariably results in their selection and continued use of

Wyandotte Dairyman's Cleaner and Cleanser

But the saving of enough time to amount to an additional profit that many times repays them for having selected this cleaner is only one of the many economies that soon result from its use.

To know how positively clean and sanitary it makes the surface washed, and how greatly it decreases the amount of cleaning material ordinarily required is to appreciate that this cleaner is not only different from all others, but also the one that proves in every detail the most profitable to use.

Order from your supply house. It Cleans Clean.

WE FED YOUR COWS

TRADE UNICORN MARK

¶ Almost every high American record for fourteen years with any breed was made with our Ajax Flakes as an important base of the grain ration.

¶ Unicorn Dairy Ration is the only feed that contains Ajax Flakes.

¶ You can hardly find a pure blood whose maternal ancestors were not fed on Ajax Flakes or Unicorn Dairy Ration.

¶ Unicorn is recognized as a safe, efficient and economical dairy feed.

¶ Unicorn during the past year made more high records than any other brand of feed.

¶ Unicorn really costs less per pound of milk or fat produced than other feeds.

Low-Wheeled Silage Wagons

HOARD'S DAIRYMAN:—Most of the farmers in this community are using low wagons of some sort in hauling corn from the field to the silage cutter, finding them a great deal more convenient and time and labor saving than high wagons. Some have built low beds between the high wheels, but our ring has used the regular low wheeled truck, one of which is shown in the accompanying illustration.

These low-wheeled trucks bring the bed on a level with the cutter table which is more convenient for the man pitching off and the man feeding than where the bed is below the cutter table and the corn must be lifted up into the cutter. The man pitching off simply throws the bundle of corn onto the table, letting the tops rest on the wagon, and is able to get another bundle up by the time the tops are passing off the wagon bed, thereby keeping a continuous stream of corn on the cutter table. The overlapping keeps the corn moving and helps the feeder, preventing the butts from spreading much over the edges of the table.

As young boys formed most of our hauling crew last year, it being difficult to hire extra men except for field work, it made it much easier on the boys. It would be too heavy work for these lads to load the corn in the fields on lower swung wagons by themselves, so that by using the low-wheeled wagons instead and having three or four field men to hand up the bundles the work went along smoothly without a great burden on the boys.

We have found the low-wheeled wagon useful in many other ways on the farm, in hulling clover, threshing soy beans, and shredding fodder. They are not so well adapted to hauling produce on the road, but on the farm they can be used any place a high-wheeled wagon can with the added advantage of a low bed, but a little heavier draft in muddy ground.

Indiana. J. L. JUSTICE.

LOW-WHEELED SILAGE WAGON

Waukesha County Guernsey Breeders Meet

When 250 to 300 people, Guernsey breeders and their families, will leave their farms and farm work in the midst of the busy season with the labor supply short to attend an all day meeting of their breed association, it is conclusive proof of the value of that association to them and that they are strong supporters of it. Appproximately that number attended the recent summer meeting of the Waukesha County Guernsey Breeders' Association, held Aug. 1, at the Wendt farm near Waukesha.

There were fewer young men in attendance this year than previously, and could you have visited the farms from which these people came, you would have found a greater number missing. But there was little complaint because of it. There was no talk of going out of business but rather how to best manage herds and farms under these changed conditions.

After a short business meeting and a generous banquet, Rev. H. C. Logan of Waukesha delivered a patriotic address, taking as his theme "The Soldier Farmer". He was followed by Prof. W. A. McKerrow of Minnesota who spoke of the work of the National Dairy Council. After sketching existing conditions with respect to the dairy business he called attention to the necessity of increasing our home markets for dairy products.

During the past year there has been in the state of Minnesota a decrease in the use of milk, butter, and cheese of well over 20 per cent and at the same time a very great increase in the use of substitutes, particularly butter substitutes. Professor McKerrow ascribed this change in part to the vigorous, well planned advertising done by manufacturers of these substitute products. Recently the producers of dairy products have started to advertise the food value of their products through the newspapers in various sections of the state, and already an increased demand is resulting. "Show the consuming public that dairy products are not only valuable but essential foods and they will demand them," the speaker declared.

Prof. Geo. C. Humphrey of Wisconsin, in speaking of the dairy business now and after the war, urged every one present to stand by his business because, in spite of present discouragements, the future promises well. He said that there is not nor never has been a surplus of dairy products although traffic congestion is just now making it appear so. He called attention to the export demand for dairy cows that is bound to come immediately after the war and urged breeders to prepare for it. Even now the demand from other states for dairy stock is large enough to take much of Wisconsin surplus. In 1914, 14,000 dairy cows were shipped from Wisconsin to other states. Last year over 35,000 were sent. Certainly there is every promise of a good future in store for the dairyman and breeder who holds on during the present crisis.

Selected Silo-grams

Corn has the greatest feeding value when mature, and if for any reason it is placed in a silo before it reaches this stage the silage is not as valuable a feed as it would have been had the corn been mature when placed in the silo. This is one reason why corn that has been frosted does not make as good silage, because usually it has not reached the stage of maturity that makes the best silage when struck by the frost. Frosted corn also loses many of its blades, and unless put in a silo within a few days of its being frosted there is a considerable loss in moisture, which—if not supplied by running water into the silage at the time of filling—will result in silage of a poor quality, owing to the fact that it does not pack so well and consequently is more liable to permit the growth of mold, etc.,

SILOS for This Year's Crop

Erected without Delay. Ready for Silage Immediately.

THIS year, of all years, you owe it to your country and to yourself to turn your corn crop into silage. Don't think it's too late to get a silo. You can have the kind of silo which 60,000 successful farmers consider the best and have it ready for your present crop. Being the largest silo manufacturers, we have your

INDIANA SILO

on hand ready to ship. You are assured of quick transportation. The silo will reach you promptly. You'll find it easy to erect. You'll have your silo up and ready in ample time.

The Indiana Silo is built of materials which are free from defects, and which do not cause or permit the ensilage to become moldy at the walls of the silo. Staves have tight mortised joints and are interchangeable, making the silo easy to erect. There is no metal spline at the joints to rust out or complicate erecting.

It doubles the feeding value of your corn crop, enables you to keep 50% more cattle on your farm, and get an increased milk flow during the feeding season.

Write to nearest address at once for catalog and full particulars showing how easily you can pay for and make money on an Indiana Silo *this* year.

FACTS ABOUT SILO FILLING

With the introduction of the Ann Arbor Disc Thrower Silo Filler we have placed within the reach of the individual farmer a Silo filler which he can afford to own. The Disc Thrower No. 78, with 78 inches of feed opening, is the right size for the average farm; the larger size Disc Thrower has 112 inches of feed opening. Both of the Disc Thrower Silo Fillers have all the patented Ann Arbor Disc Thrower features which make these silo fillers the best machines available.

We have an informative little book entitled "Filling the Silo" which tells you all about the Disc Thrower Wheel, the simple knife adjustment, the Triangular shear bar and all the other features which make the Disc Thrower such an effective machine. Write for it to

SILO STAVES, HOG & STABLE FLOORS, SCALES and all other woodwork on the farm will not Rot or Shrink if painted with "CARBOLINEUM" (Made in U.S.A.) Results guaranteed. Write Carbolineum Wood Preserving Co. Dept. 137 Milwaukee, Wis.

than would be the case if wet down thoroughly. When corn is frosted and allowed to stand in the field for a time, before being put into the silo, there is considerable loss of moisture, which, if not supplied at time of filling, reduces the value of the silage in that it is not palatable, and it may also spoil because of not being as thoroughly packed as silage made containing more moisture. After the corn is in the silo it is very difficult, if not impossible, to improve it. It might be possible to encourage stock to eat the silage by adding a little salt to it, either in the form of a light brine or by mixing the dry salt with the silage.

Under average conditions we consider it a good practice to extend the foundation of the silo from 4 to 6 feet below the stable floor. This gives additional silo capacity, and does not make it necessary to build the silo quite so high above the ground.

A silo 16x30 feet filled to a settled depth of 25 feet would contain about 92 tons of silage, and the bottom 10 feet, being more closely packed, would contain over one-half of the total, or about 47 tons.

Where there is plenty of corn it is better to put it into the silo and make hay of the alfalfa, but where there is not sufficient corn or not enough to make the necessary amount of silage, then we believe alfalfa can be easily ensiled to advantage.

It is a practice on the Hoard's Dairyman Farm to feed about 30 lbs. of silage and about 10 lbs. of alfalfa hay daily, and in connection with this about 1 lb. of grain to every 4 or 5 lbs. of milk produced.

There is nothing about concrete that produces mold in silage. If a concrete silo is properly made it will preserve silage well, whether it be built above or below the ground.

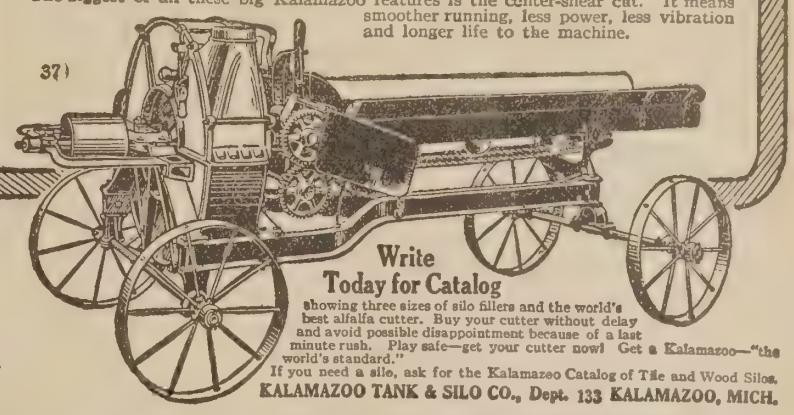
In recommending the summer silo, the Indiana Station tells farmers that too much dependence is placed on pastures. That fact was burned into the conviction of farmers last summer. Hundreds of silos are being built by farmers who could not be convinced in any other way. But few, however, are making provision for silage enough to feed in the summer when drouth prevails. That will have to come by additional tough experience.—Culled from previous issues of Hoard's Dairyman.

Campaigns for More Hogs Successful

Although definite figures are not yet obtainable, the Animal Husbandry Division of the Bureau of Animal Industry is assured that the campaign to increase pork production at least 15 per cent over last year has been successful. According to reports, practically every state has done its part in obtaining this increase, and some have more than made up their quota. Data gathered by the United States Department of Agriculture show that on April 1 brood sows on the farms in the United States had increased nine and one-half per cent over the number on the same date the previous year. Weather conditions during March and April were very favorable over almost the entire hog-producing country, with the result that there was a larger percentage of pigs raised than has been the case for many years.

Cut Your Ensilage When The Corn Is Right

It is good business to have your cutter right on the job when your corn is ready for the silo. It pays to cut it at just the right time. Even one week's delay in cutting means a big loss in feeding value. Don't wait till the last minute to order your cutter and don't depend upon someone else to do your cutting, for every cutter in the country will work overtime this year and those who wait will regret. Order a Kalamazoo Cutter now and be sure of getting your ensilage in the silo at just the right time.



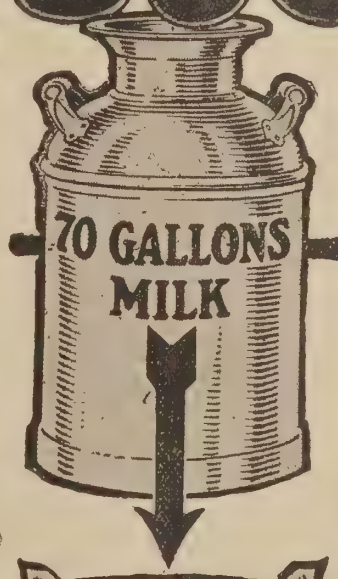
Kalamazoo ENSILAGE CUTTERS

Men who study and investigate silo fillers carefully before buying, select Kalamazoo cutters because of these

10 Big Features

1—Malleable, unbreakable knife wheel.
2—All working parts covered to prevent accidents.
3—Center-shear cut gives even flow of ensilage.
4—Absence of vibration lengthens life of machine.
5—Less power required because of center-shear and no vibration.
6—Triple feed rollers insure steady feeding.
7—Strong, sturdy, life-time frame of channel steel.
8—Reversible shear bar gives four cutting edges.
9—Hard oil cups provide ample lubrication for every part.
10—Guard to prevent accident in case belt slips.

The biggest of all these big Kalamazoo features is the center-shear cut. It means smoother running, less power, less vibration and longer life to the machine.



Write Today for Catalog

showing three sizes of silo fillers and the world's best alfalfa cutter. Buy your cutter without delay and avoid possible disappointment because of a last minute rush. Play safe—get your cutter now! Get a Kalamazoo—"the world's standard."

If you need a silo, ask for the Kalamazoo Catalog of Tile and Wood Silos.

A Message from the Secretary of Agriculture To American Farmers

To the Patriots on the Farms:

You are asked to undertake another offensive—to go "over the top" this fall for a great harvest of wheat in 1919. I need give only a few figures and facts to impress you with the increasing and urgent need of our people, our armies, the allied peoples and their armies for large supplies of American wheat.

Our reserve supply or carry-over from the 1917 crop is practically exhausted and is the smallest on record. The need of building up reserves of wheat is evident. Although this country produced a small crop of this grain in 1917, the total exports of wheat in excess of imports, including flour in terms of wheat, amounted to approximately 100,000,000 bushels for the year ending June 30, 1918. This is in comparison with 178,000,000 bushels exported in 1917, 236,000,000 bushels in 1916, and 331,000,000 bushels in 1915. It was possible for the United States to export wheat in large quantities in 1915 and 1916 only because of the large wheat crops of 1912-13-14-15, which gave this country an accumulation of stocks of this grain. Both the 1916 and 1917 crops were smaller than any crops since 1911 and besides this there was a greater demand for seed wheat and an increased population to be fed.

Moreover, it must be borne in mind that the carry-over in all the ten importing countries in Europe was practically exhausted this year before the new harvest; that the normal requirements of the exporting countries are increasing instead of diminishing; that some losses in storage and transit may be expected to continue; and that it is highly desirable that a surplus should be accumulated as insurance against partial crop failure next year.

You have been asked to sow to winter wheat this fall not less than 45,000,000 acres—an increase of 7 per cent over last year's sowing—and the Department has suggested that an even greater area, 47,500,000 acres, is desirable. The increased planting asked of each State has been carefully determined with regard to its local conditions and its reasonable capabilities. Your county agent can tell you the quota assigned to your State and you can apply the responsibility to your case.

You have occupied and do occupy the first line trenches of the food army. You have to fight difficulties too. I am not unmindful of these. In the Department of Agriculture we consider them daily, and daily we give our best efforts to help you meet them. You know of the difficulties in your community, but I know of them in many communities of many States, and so seriously do they impress me that I might almost consider them insurmountable had not American farmers last year, and again this year, revealed the true American fighting spirit and ability to meet serious situations. They will not let the war fail because of deficient food production.

Let us sow liberally for a big harvest in 1919. It has been called the Liberty Wheat Harvest. We all hope it will be. But let us undertake the task with the determination that we will sweat our blood for many more if need be before we yield one measure of our freedom to a Prussian domination. Let us fight in the furrows.

D. F. Houston,
Secretary of Agriculture.

HOARD'S DAIRYMAN

New Record in Tick Eradication

Records made last year in eradication of the cattle fever tick and the release of territory from Federal quarantine will soon be eclipsed. The Bureau of Animal Industry of the United States Department of Agriculture expects to win more ground from the parasite this year than in any previous equal period since the co-operative federal and state campaign was started in 1906. The 1917 mark of 70,749 square miles released from quarantine is expected to be considerably bettered in 1918.

Further than that, the tick fighters are going to smash through to the ocean. It is practically certain that all of South Carolina will be released from quarantine next December 1, the department specialists say. South Carolina will be the first state on the Atlantic coast to be entirely freed. Last year the anti-tick forces drove a wedge through Mississippi to the Gulf. This year they hope to widen the wedge to the Gulf by including Louisiana in the tick-free area. With the wedge to the Gulf and the wedge to the Atlantic, the cattle fever tick will be the victim of an encircling movement. His days are numbered. By 1921 the tick fighters hope to have driven the parasite permanently from American territory.

Progress in South Carolina

South Carolina progress has been rapid. Eradication of the tick was taken up actively in that state only in April, 1914, when the legislature provided funds for co-operation with the Department of Agriculture. Fourteen counties had been released at that time, but the great body of the state was still tick infested. The work had been carried on steadily and systematically and has been free of disturbance and hostile agitation.

With the eradication of the tick in South Carolina a new era for live stock raising is expected to open. South Carolina, like other southern states, has excellent soil and climatic conditions for pasturing. Cultivation of both plant and animal life will go hand in hand. One of the great obstacles which has prevented the South from feeding itself will have been removed from South Carolina, as it will eventually from all the southern states.

Benefits in Mississippi

Benefits of tick eradication are indicated in reports that are coming to the Department of Agriculture from Mississippi. Since the quarantine was raised in December, 1917, there is said to have been an unprecedented influx of capital and pure-bred live stock to that state. Thousands of pure-bred cattle and hogs have been taken there, and large numbers of people have gone from corn-growing states to buy land and establish breeding farms to take advantage of the favorable conditions for stock raising. The same reports always have followed wherever the tick has been driven out.—U. S. Dept. of Agriculture.

Silage made from corn that has an opportunity to fully mature, but which has been planted in such a way that the ears have not fully developed, has practically the same composition and the same feeding value as silage made from corn equally well matured but which will yield a fair crop of ear corn to the acre. This is supposed to be due to the fact that in the production of the ears there is merely a transfer of the nutrients from the stalk and leaves to the ear. There is a slight decrease in the feeding value of corn when placed in a silo, but this should not exceed 10 per cent, and the loss is less from this method of preserving than in any other.

How about the Corn? A silo means that you are sure of the crop. Order your silo—have it ready. Early order means early shipment—freight cars will be scarce this fall. Write for information about Saginaw and Liberty silos.

Resolve to Build a Silo

(Continued from page 95)

parative feeding value. In Canada a mixture of peas, oats, and vetch has produced heavier yields per acre than corn, and the silage has been found superior, if anything, to that made from corn in those sections. In Northern Wisconsin clover and timothy is coming into high favor as a regular silage crop, and in other sections sundry and various other crops have proven their value and have their particular supporters. Indeed, the silo has come to be the means of caring for almost any crop and holding it for winter feed or as insurance against brown and dry summer pastures. But where corn will make a good crop, Corn is King.

Filling the Silo

Time may be well spent in studying the process of filling the silo and talking it over with neighbors. Ask the neighbors when they cut their

*The height of the silo itself should be from one-fifth to one-sixth greater than given in the table in order to hold the quantity of silage noted.

corn or other material for the silo and in what lengths they cut it. Was it dry? Did they add water? Did they use a distributor, and, if so, how did they handle it? Did they tramp the cut material in the silo? Or, what means did they adopt to get it to pack well? Ask all of these questions and then look into their silos, observe the quality of the silage, find out if possible why they were not more successful. Visits to several farms and observation of methods and results will be time well spent and will bring money to the pockets of the man, whether an old silo owner or a prospective owner, who thus shows a realization of the value of a proper understanding.

Preceding or going with this personal examination of results, there should be a study of what the colleges and what practical farmers have had to say on the subject. For this purpose we know of no better literature than bulletins from the experiment stations and the experiences of dairymen as given by them in past issues of Hoard's Dairyman.

The Summer Silo

Experiments at agricultural colleges and practical experience of many farmers prove conclusively that soiling through the silo is insurance against scanty summer pastures and it is the cheapest, easiest, and best method of soiling. In case the expected emergency does not arise the feed is not wasted but can be held for winter's use when too often the silage runs low and the need is great. The summer silo is coming into a deserved place of esteem in the minds of the dairy farmer, and it is establishing itself as a part of the system for the more economical production of dairy products.

Silage and legume hay go a long way toward solving the disconcerting question of rising grain prices, for it would be difficult not to formulate a good ration with them even with the cheapest available grain or mill feeds; in fact, many are finding that silage and alfalfa may be used alone to advantage if cows have been properly adjusted to this system of feeding.

Vermont Butter Scoring

The seventh monthly Vermont Educational Butter Scoring was held July 15. The judges were V. R. Jones, H. B. Ellenberger, M. R. Tolstrup, and O. M. Camburn. Thirty-two creamery samples and 4 dairy samples were entered and they proved to be the best and most uniform lot yet assembled at any of the monthly scorings. Eight boxes scored 94 or over and the average of all creamery samples was 92.55, while the dairy samples averaged 91.5. The buttermakers are to be congratulated on doing so well with their July butter. There was, however, a great variation in moisture content the average being low, only 13.57.

A few samples were a little gritty, two or three were somewhat mottled and several were inclined to be leaky. During the past seven months not more than two or three of the samples have shown evidence of overworking which each month has brought a number which could be improved by a little more working. The tendency seems to be to underwork, which accounts for most of the above mentioned defects. The most prominent defects in flavor were old and stale cream flavors, again emphasizing the importance of care of cream on the farm and frequent delivery to the creamery. Creameries where cream was delivered promptly averaged higher in score than others with more infrequent deliveries and those using starter scored higher than those which did not.

Since making butter from whey cream is quite new in Vermont, it is interesting to note that the only sample of such butter entered scored 92.5 and none of the judges were able to detect that it was made from whey cream.

The following is a list of those receiving a score of 90 or over and who have given permission to have their names published:

Creamery samples: R. H. Lawson, 90; C. M. Lilley, 93; L. A. King, 94.5; Hanna Halonen, 94; H. C. D. Smith, 90.5; L. R. Brown, 90; F. A. Rist, 93; V. A. Vancour, 95; O. E. King, 92.5; L. S. Flint, 94; W. E. Hood, 90.5; E. Trohan, 94; C. W. Dodge, 92.5; C. M. Story, 94; T. S. Morse, 93.5; H. N. Paquette, 91; E. Beaudet, 92.5; John Bond, 92; E. C. Hilles, 92.5; and R. H. Metcalf, 93.5.

Dairy samples: C. E. Tenney, 92; T. W. Kingsbury, 92.5; and M. G. Eastman, 90.5.

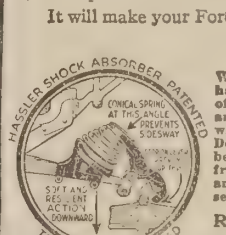
Vermont. H. B. ELLENBERGER.

A herd of thirty cows will require about 160 to 170 tons of silage if fed upon it throughout the entire year. A silo 12 feet in diameter and 30 feet high will hold 68 tons when full; a silo 14 feet in diameter and 35 feet deep will hold 117 tons, making the two silos with a capacity of about 180 tons, which would be about right to supply a herd of thirty cows for 365 days. We believe it would be well to build the silo used in the summer 12 feet in diameter and the other 14 feet. It will require approximately 18 to 22 acres of average yielding corn to fill the two.

Many of the larger hotels of the country are using no cane sugar in pastries and desserts.

Don't blame him, Mr. Ford Owner.
Your tire costs depend on YOU

YOU have the remedy for high tire cost within easy reach. Increase your tire mileage and keep your cost per mile for casings at before-the-war figures by equipping your Ford with the

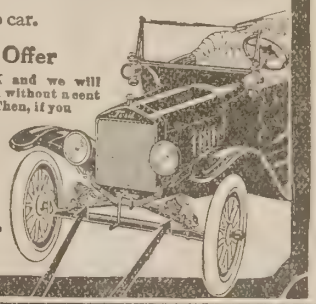


For FORD Cars — HASSLER PATENTED Shock Absorber — For FORD Cars

The Hassler Shock Absorber lifts the weight of the car off the tires. It cushions every jolt and jar. It prevents sidesway and upthrow, reduces rattling and vibration.

The Hassler Shock Absorber will immediately increase your tire mileage. It will pay for itself every time you ride 3,000 miles. It will enable you to get thousands of extra miles out of every set of casings.

It will help you do your little to avert a rubber famine among our gallant Allies, and keep down the first cost of tires here at home.

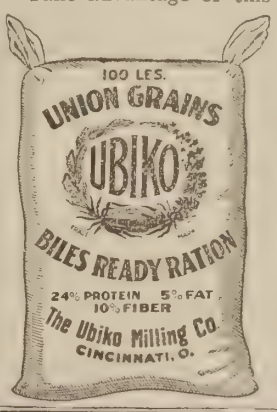


It will make your Ford ride as smoothly as a $2,000 car.

10-Day Free Trial Offer

Write today for FREE TRIAL BLANK and we will have a set of Hasslers put on your Ford without a cent of expense to you. Try them 10 days. Then, if you are willing to do without them, they will be taken off without charge. Don't ride without Hasslers simply because someone discourages you from trying them. Accept this offer and see for yourself. Over 400,000 sets in use. Write today—NOW.

ROBERT H. HASSLER, Inc.
1813 Spruce St. Indianapolis, Ind.



Take Advantage of this Opportunity

Order Now. Let us send you a shipment of

UNION GRAINS

UNION GRAINS, the famous balanced ration for milk production, is now comparatively low in price. The railroads are in fair position to handle shipments. The Food Administration is urging dairymen to get feed now. It gives you permission to order a four months' supply for shipment within sixty days.

Take advantage of this opportunity. Bear in mind the difficulty you had to secure feeds last winter and order now. If you delay, your order will arrive when railroad facilities are taxed to the utmost. Precedence will be given to essential war supplies and you may not succeed in getting a shipment through.

You can't make a mistake by ordering Union Grains. It is composed only of concentrates, no fillers. The cost is little if any in excess of what you would have to pay for the ingredients alone.

We have a record sheet that will help prove the value of Union Grains. Send us your order now and use the sheet to note the improvement in your results.

THE UBIKO MILLING COMPANY
Dept. H, CINCINNATI, OHIO

A Better Way of Sealing Preserves, etc.

In putting up preserves, catsups, chow-chow, chili-sauce, berries, Indian Relish, etc., don't follow the troublesome paraffine wax method of closure.

The better and easier way is to use a MIDGET CROWNER and seal your bottles (up to 14 ins. in height and 4 ins. in diameter) with air tight Crowns (3 sizes).

In storing condiments of all kinds for future use you will find this the safest method of sealing.

Write for full particulars.

September 2-7. Minnesota State Fair, St. Paul. Thos. H. Canfield, Secretary.

August 30. Field Day of the New England Guernsey Breeders at Albamont Farms, Campton, New Hampshire.

Wisconsin Dairy Council Organized

On August the 7th representatives of the various dairy and agricultural organizations of the state of Wisconsin met in Milwaukee, at the call of A. J. Glover, Associate Editor of Hoard's Dairyman, authorized by the Wisconsin State Council of Defense. This meeting was called for the purpose of uniting the efforts of all the state dairy and agricultural organizations and allied industries for the purpose of promoting the dairy industry of Wisconsin. A corporation was formed and it is called the Wisconsin Dairy Council.

In the articles of organization the object of the Wisconsin Dairy Council is stated as follows: The purpose of this corporation shall be to promote the dairy industry of the state of Wisconsin, to further educate the public regarding the necessity of dairy products to the welfare of the human race, to encourage adequate production of high quality dairy products, and to improve marketing methods and conditions.

We shall give a more complete report of this meeting and the purpose of the Wisconsin Dairy Council in the next week's issue of Hoard's Dairyman.

Waukesha Holstein Breeders Hold Picnic

The members of the Waukesha County, Wis., Holstein-Friesian Breeders' Association held their picnic on Riverview Farm, owned by Geo. J. Schuster, near Mukwonago, August 8. The meeting was held in a pasture, bordering upon Fox River, and it was a most beautiful spot for such an occasion. Mr. Schuster enjoys co-operating with the Holstein breeders of Waukesha County, and is doing his full share in helping to advance the interests of Holstein cattle. The chairman of the meeting, Mr. C. J. Will, complimented him on the good work he is doing and assured him that the breeders of the Black and Whites in Waukesha County appreciated his generosity and the good work he is doing.

The program of the occasion was as follows: In the forenoon the barns and cattle were inspected. At noon lunch was served by women working for the Red Cross society. The first speaker in the afternoon was J. E. Stallard, county agent of Waukesha County, and he demonstrated how the soil could be tested to determine whether it was acid or not. He spoke of the benefits of lime and stated that alfalfa would not grow well on an acid soil.

A brief statement was made regarding the live stock sales pavilion which is being constructed by the breeders of Waukesha County. The building will cost about $17,000 when completed and it will provide every convenience for holding sales. The sum of $15,000 has already been raised, which would have been enough under normal conditions.

Governor Philipp discussed agricultural problems from the standpoint of the state. He referred to the proceedings started by the attorney general of the state against some of the milk shippers near Racine, because they discussed with milk dealers the price which they should have been paid for milk last fall, thus violating the anti-trust law. When the Governor was asked to give his approval for continuing the case he refused, because he did not believe dairymen should be put in jail for this offense. We wish he had advocated that the anti-trust law be amended so that it would be legal for co-operative associations to meet and discuss prices without violating any law. Such a law should be passed by the legislature next winter.

Professor Kildee of Minnesota discussed the future of the dairy industry. He held that everything points to a bright future for the dairy interests. The dairy cattle of Europe have been materially reduced and the United States is the only country in position to help replenish its cattle and supply its population with dairy products till the cattle are again replaced. Professor Kildee also gave a cow demonstration which followed the regular program.

A. J. Glover, Associate Editor Hoard's Dairyman, spoke upon the marketing of dairy products. He declared dairy products are selling too cheaply and that their prices are not in keeping with the prices of other farm products. This condition may be attributed in part to the fact that the consumer does not appreciate the necessity and food value of milk and its products. He urged that dairymen should unite in educating the consumer regarding the value of their products. He referred to the Wisconsin Dairy Council which was organized the day before in Milwaukee for the purpose of uniting the efforts of every dairy and agricultural organization in the state to advertise dairy products and to educate the consumer as to their food value.

Mrs. Laura Ely, Waukesha County Food Demonstrator, gave a talk on the relative value of foods, the importance of milk, and the various methods of preserving foods.

New York Butter Market

New York City, August 6th:—The receipts of butter are light at present and the quality is the poorest of the season to date. Practically none is arriving in market in good condition. Either it is heated or it shows oily or seasonal defects. In any event it is almost certain to be more or less moldy. The extreme heat which is the cause of so much poor butter seems to prevail throughout the butter producing sections of the country at present.

Dealers are having serious difficulty to supply the demands on them for extras and even firsts are not present in great quantities. There is, however, an abundance of under-grades which are moving very slowly. As a whole, outside the demand for high-grade butter, the market is very quiet. The accumulations of butter which have been in evidence for about two weeks have gradually diminished through the agencies of governmental demand, out-of-town buyers, and local consumption. Even though active buying has been absent for some time it seems that under present conditions there will be no decline in price. On the contrary there is a feeling that in the near future prices will advance because of lessened output and the approach of fall.

There has been no marked change in quotations since last week. On one day there was a decline of a quarter cent but on the following day a recovery was made and the old quotation prevailed. Today there was an advance of a quarter cent and the quotations at the close were as follows: extras (92 score), 45@45¼c; higher scoring than extras, (93 score or higher), 45½@46¼c; firsts (87 to 91 score), 43½@44¾c; and seconds (83 to 87 score), 41@43c.

W. B. LIVERANCE.

Boston Milk Prices

The Regional Milk Commission for New England announced last week an increase in the price for milk, in Boston and vicinity, of ½ cent per quart for August and September. The prices announced are 15c per quart delivered at homes and 14c per quart at stores. These are the highest prices ever paid for milk in New England. Other cities are falling in line with the Boston advance, several of them going to 15c per quart to family trade.

Richard Pattee, manager of the New England Milk Producers' Association, in commenting upon the recent advance, stated that this and the advance made in July were the first and only instances in New England when an increase in price was wholly paid over to milk producers. Previously the dealers have absorbed at least 50 per cent of any advance in the selling price of milk.

In July the Commission advanced the price to consumers from 14c to 14½c per quart and gave the producers an advance of ⅝ of a cent over the June price of 7½ cents per quart. All of the August and September advance will go to the farmers, making a return to them of 8⅝ cents per quart. The price is subject to a surplus arrangement which will have slight effect, as there will be very little surplus the remainder of the year.

Subject to the surplus plan the producers are now getting more than they ever got before and ⅛ cent per quart more than they got last winter. A part of this increased price is absorbed in higher freight rates and war taxes.

The added cost of labor and grain have so affected production that the farmer finds himself but slightly better off than a year ago when he got practically 1½c per quart less for milk.—N. E. MILK PRODUCERS' ASSOCIATION.

Imported Guernseys Sell Well

The picnic and sale of imported Guernsey heifers by the Barron County (Wis.) Guernsey Breeders' Association was successful beyond the expectations of the officers of the association. The heifers were a fine lot and many from different parts of the county gathered early in the day to look them over. When the time for the sale arrived the entire lot sold readily, the average price for 44 head being $219.29. All of them, except one, will remain in Barron county.

The value of the sale to the dairy interests of Barron county will be more fully appreciated in five or ten years from now. The grading up and improving of the herds of the county in the last fifteen years has caused the Barron creamery to grow from $25,000 to $500,000 in volume of business, and no one will dispute the statement that the dairy products of the county can easily be doubled in another ten years with the same improvement.

Much credit is due to F. W. Meyer, secretary of the Guernsey Breeders' Association, who, we believe, was one of the prime movers in bringing this importation of stock to the county.

Wisconsin. WM. BARTELT.

Save manure. The necessity for this is sometimes forgotten by the small farmer who is just starting in the business of live stock production. Fertilizer is scarce, high in price, and hard to get for many reasons. Therefore, the more manure saved to apply to the land the less need for fertilizer.

Sale Announcements

Aug. 20—Guernseys and Clydesdales. Glen Farm Sale. Newport, R. I. Leander F. Herrick, Worcester, Mass., Mgr.

Aug. 27—Guernseys, Dispersions of the T. D. McChesney, Minette, N. Y., and Winthrop Condin, Mt. Kisco, N. Y., herds at New Castle Farm, Mt. Kisco, N. Y. Leander F. Herrick, Worcester, Mass., Manager.

Sept. 4—Holsteins, Sauk Valley Dairy Farm, Holsteins. O. S. Cass, Sauk Center, Minn.

Sept. 11—Holsteins. Consignment Sate at Cuba, N. Y., Fair. L. J. Waldock, Mgr., Cuba, N. Y.

Sept. 11—Holstein Dispersal Sale. Springdale Farms, Fishers, Ind., Dr. S. P. Scherer, Owner.

Sept. 12—Ayrshires. Consignment Sale at Cuba, N. Y., Fair. L. J. Waldock, Mgr., Cuba, N. Y.

Sept. 13—Guernseys and Jerseys. Consignment Sale at Cuba, N. Y., Fair. L. J. Waldock, Mgr., Cuba, N. Y.

Sept. 17—Holsteins. Centralia Calf Farm, Centralia, Ill.

Sept. 18—Holsteins. W. F. Phelp's Holstein Sale, Joplin, Mo.

Sept. 25-26—Holsteins. Absolute Disperison of the Chas. Prange and S. E. Gehrig herds at New Douglas, Ill.

Oct. 1—Holsteins. Dispersion of Broadmead Farms Holstein Herd at Union City, Mich. Thos. B. Buell & Son.

Oct. 3—Holsteins. Dispersion Sale Prairiedale Farm Herd. Galt & Spencer, Dixon, Ill.

Oct. 4—Holsteins. Redwood Holstein Farm Dispersion at Redwood Falls, Minn. Glenn W. Gold.

Oct. 10—Holsteins. Fred E. Zimmerman, Washington, Ill.

Oct. 12—Jerseys. Texas Jersey Cattle Club Sale at Cleburne, Texas. Mrs. J. Riley Green, Mgr., Wolfe City, Tex.

Oct. 15—Holsteins. Nebraska Holstein Breeders' Sale. Union Stock Yards Sale Pavilion, So. Omaha. Dwight Williams, Bee Bldg., Omaha, Neb.

Oct. 16—Jerseys. Texas Jersey Cattle Club Consignment Sale at Sherman, Texas.—Mrs. J. Riley Green, Wolfe City, Sale Mgr.

Oct. 22-23—Holsteins. Lake Mills Holstein Breeders' Semi-Annual Consignment Sale, Lake Mills, Wis. F. H. Everson, Manager.

Oct. 26—Jerseys. Texas Jersey Cattle Club Sale at Dallas, Tex. Mrs. J. Riley Green, Mgr., Wolfe City, Tex.

Nov. 12-13—Holsteins. Waukesha County Holstein Breeders' Semi-annual Sale. Waukesha, Wis. W. L. Baird, Sec.

Nov. 14—Jerseys. Texas Jersey Cattle Club Sale at Waco, Texas. Mrs. J. Riley Green, Mgr., Wolfe City, Tex.

Dec. 10—Holsteins. Gormley Bros. Dispersion Sale. Jefferson, Wis.

Wholesale Butter Prices

In a bulletin issued under date of July 30th, the Chicago branch of the U. S. Bureau of Markets gives the following survey of the butter market:

The wholesale prices below are determined from reports of actual sales made by wholesalers to jobbers and chain store operators, either for cash or ten days' credit.

Wholesale Prices—Fresh Creamery Butter

Score	Chicago Whole milk	Chicago Centralized	New York	Boston	Philadelphia
94	44¼		46		46
93	44		45½	45½	45½

Chicago Market

The market was unchanged today, but an easier undertone was evident and trading was light. Fancy makes of "whole milks" were not so plentiful and practically all shipments show the effects of heat. Cars of "centralized" scoring full 90 points were firm and active at 44 cents although several cars of "centralized" showing various defects were sold at 43 to 43½ cents. Receipts yesterday of 12,349 tubs were 6,767 tubs less than the corresponding day last week and storage accumulations were normal.

New York Market

The market was quiet and an uncertain feeling existed. There seemed to be a tendency for buyers to purchase in small lots for immediate needs. The receipts yesterday were moderate and the street stocks today increase over 5,000 tubs. The storage holdings increased more than 175,000 pounds.

Boston Market

A general quiet prevailed on the market today and trading was limited to small lots of the medium grades. There were no car lot transactions although there was a little more inquiry and dealers are expecting a more active demand. Butter from nearby points is not arriving in good shape due to being heated. Receipts were normal yesterday, but the street stocks showed a marked decrease this morning.

Philadelphia Market

Trading today, while not brisk, was more active than Monday. More sales of undergrades were reported today which were generally at yesterday's prices. The market continued steady with receipts moderate and a fair demand. Receipts yesterday amounted to 2,986 tubs. Storage holdings showed very little increase while supplies were about the same.

Jerseys Bid for Sophie 19th's Crown

A baker's dozen of Jersey cows have made records ranging from 900 to 999.1 lbs. of butterfat in 365 days, but the coveted 1,000-lb. mark has not yet been reached—not by nine-tenths of a pound.

A number of Jerseys are now stepping along so briskly that their owners fully expect them to pass, by several pounds, the half-ton objective which Sophie 19th, the present record holder of the breed, missed only by a fraction. Three cows have just made more than 100 lbs. of butterfat in the same month and another one made 98 lbs.

The foremost contender is Rochett's Princess, an eight-year-old cow owned by Meldrum Gray of New Mexico. She made 108.58 lbs. of butterfat in thirty-one days and already had 296 lbs. to her credit for ninety-six days. She is a cow of great constitution and capacity, and is working under a southern sun which has undoubtedly made her prove her mettle. Rochett's Princess has qualified for Register of Merit on two previous occasions, having a four-year-old record of 452 lbs. of fat and a five-year-old record of 713 lbs. of fat.

Vive La France and Old Man's Darling 2d, both in the herd of Pickard Bros., Oregon, also have a great chance to become champions in the aged cow class. Vive La France already holds a title as senior three-year-old champion of the Jersey breed, with a record of 892 lbs. of butterfat to her credit. She was only four years and six months of age at the start of her present lactation. She has made 208 lbs. of fat in sixty-eight days and in one month has made 108 lbs. of butterfat.

Old Man's Darling 2d is the cow that created quite a sensation in the 1916 show ring. She had just completed a senior two-year-old record of 694 lbs. butterfat and was taken to the fairs in dry condition. She nevertheless finished her tour of the fairs and was undefeated in her class. She is a splendid example of beauty and ability combined. Her dam is the great cow, Old Man's Darling, with an official record of 14,130 lbs. milk and 817 lbs. fat at five years of age. Old Man's Darling 2d has made 106 lbs. fat in the second month of her present lactation.

Rochette's Princess, an eight-year-old Jersey cow owned by Meldrum Gray, New Mexico. She made 108 lbs. butterfat in 31 days and already has 296 lbs. to her credit for 96 days.

Another western cow that is doing wonderful work is Goldie's Nehalem Beauty, owned by Clifford Reid of Oregon. This cow first attracted attention by making a junior three-year-old record of 750 lbs. of fat, which was followed immediately by a period proof of 904 lbs. of butterfat as a four-year-old. "Goldie" is now six years old, and has just finished a month's record of 98 lbs. of butterfat, giving her a total of 255 lbs. of fat for eighty days.

Sophie's Agnes, owned by Ayredale Farms, Maine, is half finished with her year's work, which may transplant the blue ribbon from Sophie 19th's stall at Hood Farm, where Sophie's Agnes was formerly owned, to the Ayredale barns. At six years of age this cow has made 545 lbs. of butterfat in 186 days.

There has never been a time when so many great records were in the making, and the Jersey breeders who are carrying on this work are entitled to great credit for their confidence in the dairy industry. Animals from the greatest herds will undoubtedly command the best market, and the official year's test will be the instrument by which "greatness" will be measured. —AMERICAN JERSEY CATTLE CLUB.

Legal Control of Oleomargarine

In his book entitled "Food Products" Dr. Henry C. Sherman of Columbia University discusses as follows the legal status of oleomargarine:

In the United States the oleomargarine industry has been regulated by the Federal Laws of August 2, 1886, and May 9, 1902. The latter law taxes uncolored oleomargarine 0.25 cents and colored oleomargarine 10 cents per pound. This prevents the use of artificial coloring matter in oleomargarine made and used in this country. For this reason preference is now given to fats having naturally a yellow color. Government officials have objected to the use of yellow fats in making oleomargarine, but have not been able to stop the practice. The oleomargarine now commonly sold is distinctly yellowish, though not nearly so yellow as is ordinary butter.

The United States law does not specify the fats to be used in making oleomargarine, but all mixtures of butter with other fats must be sold as oleomargarine and practically must be uncolored, since the tax of 10 cents a pound on colored oleomargarine is prohibitive. Factories must register with the Bureau of Internal Revenue and furnish the government with detailed reports of their operations. They are always open to federal inspection.

In Great Britain since 1899 the maximum proportion of butterfat in oleomargarine is limited to 10 per cent. Since 1907 the water content is limited to 16 per cent and the factories are subject to inspection.

In France up to 1897 butter and oleomargarine could be mixed in any proportions provided the mixture was sold for what it was. But, by law of April 16, 1897, the amount of butter which may be admixed with oleomargarine is limited to 10 per cent.

Germany and Austria forbid the direct mixing of butter and oleomargarine either during or after manufacture, and restrict the amount of milk which may be used in making the oleomargarine to 100 parts of milk or an equivalent amount of cream to each 100 parts of fat. In effect, this limits the butter or milkfat content of the finished product to about 3.5 per cent. These countries also require the use of 10 per cent of sesame oil in oleomargarine to permit its more ready detection.

In Denmark under the law of Jan. 1, 1906, the proportion of butter in oleomargarine is limited to a maximum of 15 per cent, the color is restricted, and the product must contain 10 per cent of sesame oil.

In Belgium under law of May 4, 1900, it is required that oleomargarine contain at least 5 parts of sesame oil per 100 parts of fatty matter and that it be further "earmarked" by the addition of 0.2 per cent of dry potato starch, which may readily be detected by the iodine reaction.

The Importance of Water

HOARD'S DAIRYMAN:—Without any question, young animals must have constant and abundant nourishment to induce growth, and most important as a portion of this sustenance is plenty of clean water every day. Most of us like to chronicle our successes, but our failures oftenest teach us lessons that are remembered. I shall never forget the mistake I made with a fine bunch of calves the first year I was on the farm. It was my ambition to raise a dozen heifers and I began selling cream only that I might have a supply of skimmilk, feeling sure that it would guarantee lusty growth in calves if well balanced with meal.

The milk was fed warm from the separator and regularly. The calves were fed well and given good care otherwise, but for some reason did not thrive. They had good enough appetites and were fairly playful. Early in the summer they began to cough. Later one of them died. Someone intimated tuberculosis. In September we lost another. About this time my wife visited the farm and we took her out to look at the stock. Upon viewing the calves her first remark was: "Do these calves get all the water they need? They look as if they wanted something." I replied that they got all the milk they would drink and did not need water. But at the same time I was conscious that I was in error. Immediately after the good woman's department was made, we began to water the calves.

Most men think themselves bright enough to take care of things without having a woman about to tell them how. I was in that class. But I have learned that for intuition and honest, common sense one woman is worth more in a minute than sixteen men for a whole week, when caring for young animals, if she is anything like my wife.

But to return to the calves. With water added to the ration they began to show rapid gains, stopped coughing, and made no further demands for the tuberculin test. They all grew up and some of them have made good cows, though none of them have become large cows. They were all slow in maturing, so slow in truth that an expert who was brought to examine them just before they were three years old pronounced them "coming two," basing his decision upon their teeth, which were very late in changing to the usual three-year form.

Any person buying a farm cannot be too careful to see that it is well watered with a supply that cannot fail. Sometimes the purchaser of a sheep farm will be told that sheep are an exception. "They do not need water. They never drink." This is a serious error as any person may discover by furnishing sheep some pails of water in winter or any other time when they are kept from the brook. They will drink feverishly. Furthermore, if sheep are kept from water for any length of time they will register a distinct marking in the fibre of the fleece from one-sixteenth to one quarter of an inch long. Undoubtedly short and light weight fleece are due ofttimes to a lack of water as well as feed.

Connecticut. HOLLISTER SAGE.

EDITORIAL COMMENT

It is generally considered that a cow produces a calf each year. Professor Oscar Erf calculates from data that he has obtained from cow testing associations that a cow produces one living calf every 17 months. Failure to breed, abortions, and calves that die produce a loss of 28 calves per 100 cows. In other words, a farmer owning 100 cows may reasonably expect to raise 72 calves a year.

We have a big crop—more than enough to feed ourselves, but this does not mean that we need not be saving. Our reserves of foods are low, for we have scraped the grain bins to their bottoms. It is not only necessary to build up our own food reserves, but we must still furnish our allies with food. No nation is safe from starvation unless it has a food reserve, and our present crop assures us of a reserve for next year, provided we do not waste and that we follow the instructions of the Food Administration.

The Signal of the Silo, which forms the cover page for this week's issue of Hoard's Dairyman, seems particularly appropriate to the time when a campaign is on for a silo on every farm. This poem was prepared for us by Mr. Larned, peculiarly the poet of the dairy farm, and made a striking appeal when used by us in a similar form some two years ago. Indeed, the demand for that issue was so great that, despite our placing in stock a heavy supply, our reserve has been completely exhausted. To meet this demand and to present it to our new friends and subscribers we are therefore reproducing—

"Th' treasure-trove of cattle that are hungry with the morn
A storm-bound silo, standin' in restless sea o' corn.
Th' herd is plump as butter—and if folks have cause to thank
It's because each farmer's silo is a sort o' savings bank."

The promise of a large corn crop lends encouragement that there will be an adequate supply of roughage for live stock this winter. Corn converted into silage forms a most excellent feed and may form all the roughage portion of the ration. A cow may be fed 60 lbs. of silage daily without danger of injury. It is better to feed some hay when it can be obtained for a price in keeping with the prices of dairy products. But should hay be too expensive to feed or to use the accustomed amount, silage may take its place provided it is supplemented with the proper concentrates.

More silo capacity will be required to supply the herd with silage when there is no hay, and now is the time to determine when enough silage can be ensiled to meet all requirements till grass comes in the spring.

It should be remembered that when there is no legume hay like clover, alfalfa, soy beans, etc., a feed mixture rich in protein is required. We believe the dairy farmer should give the feed question serious consideration and make preparations to lay in what is needed at an early date. Heavy freight traffic this winter is going to make prompt shipment of feed uncertain.

In the alfalfa section of the West, alfalfa hay is selling for about $10 a ton in the stack. It will cost from $3 to $5 to bale it and put it on the cars. Freight to eastern points will amount to $10 or $15 or more per ton. This will make alfalfa cost the dairy farmers in the East about $25 to $30 a ton. Some alfalfa hay has already been laid down in Southern Wisconsin for $26.50 a ton. Quotations are a little firmer of late because the farmers of the West are not marketing a great deal of hay at present.

The difference in prices between alfalfa hay in the West and in the East may be attributed to live stock and also to the fact that the West grows large amounts of alfalfa. There is no question but that live stock increases the prices of all farm crops. This fact should never be lost sight of by the dairy farmer. The other lesson in this situation is that where there is a large supply of any particular crop the prices are much cheaper. The hay crop throughout the Mississippi Valley and East is below normal and this has created a brisk demand for hay and made prices high.

THE COST OF MILK

Professor Pearson has worked out a formula concerning the feed cost of milk that seems to be fairly satisfactory. His rule is that the cost of 100 lbs. of milk is 20 lbs. of home grown grain, 24 lbs. of purchased mill feed, 110 lbs. of hay, and 3 hours of labor. These figures are modified by the varying values of feed in the different months in the year. The yearly average is given at $2.910, which is within a fraction of $3 a hundred. But in considering this question we should not lose sight of the important fact that the better the cow the less does the milk cost. At the bottom of that proposition stands the effort of the wise dairy farmer to increase the capacity of his cows by the use of more intense dairy quality in the sire and the keeping of a milk and butterfat record with every cow. Right here is a chance for every farmer to make a margin in his favor. Some see it, others do not.

MAN BACK OF COW

The man back of the cow has a larger responsibility in the future development of the dairy industry than is comprehended by him at the present time. We have always held that the man who milks the cow should have a large part in getting her product into the hands of the consumer. He should not be content to simply produce the milk and then depend entirely upon some one else to prepare and market his product. We know the producer will be better satisfied and take a deeper interest in his business when he places himself in position to prepare his milk for marketing. Farmers who have co-operated to manufacture butter, cheese, or cream or sell whole milk are doing better and are in closer touch with the market conditions than those who contract their milk for so much per hundred pounds. Those who control their products till ready for the consumer are in position to get full market price for their products.

FUTURE OF DAIRYING

Mr. E. S. Brigham, commissioner of agriculture of Vermont, writes us regarding the future of the dairy industry and its possibilities. He says: "I feel that no industry has a brighter outlook than the dairy industry, if those engaged in it will rise to the occasion and take charge of the advertising material which the investigations of Dr. McCollum and his associates have placed in their hands. We have always regarded the dairy cow as a wonderful animal and called her 'The Foster Mother of the Human Race'. In the light of recent investigations her value is now more apparent than ever. It is wonderful to think that this animal can take from the leaves of forage plants the vitamines essential in every diet, but especially necessary in in the diet of the young, and concentrate them in milk in a form readily digestible.

"If the dairymen of the country would produce a standard product, like the orange growers of California, and devote as much attention to advertising as they have, prosperity could not help but come to the dairy industry."

It is highly desirable for those who are engaged in the dairy industry to follow the suggestions made by Mr. Brigham. We must inform the consumer in regard to the nourishing properties of milk. We must also move to produce a more uniform quality of butter and cheese.

COW PHILOSOPHY

"A cow to do her best must be made to feel that she is the favored one of the herd. If a cow gets it into her head that she is not the leader it will decrease her flow of milk." These statements were made to us the other day by Carl Gockerel, who is one of the best cow men in the country. Mr. Gockerel has made world records with noted cows and through them he has earned for himself an enviable reputation.

The key to his success is being capable of understanding the cow. He studies her and learns what she likes and dislikes. He knows that if a cow's likes can always be satisfied that she will do her best work. "It is all right," remarked Mr. Gockerel, "to turn a cow, on official test, out with the rest of the herd, provided she is boss. If she is not and several other cows in the herd proceed to horn and drive her about she should be kept in a separate place. Otherwise it will materially decrease her production."

It is these small things which count in large proportions in caring for the ordinary herd as well as those making official records." "A cow," Mr. Gockerel continued, "should never be permitted to shrink in milk flow if good feeding and care can prevent it. I have had to steal feed on some farms to get just what a cow wanted. At one farm used to go out after midnight, when the forema was asleep, and cut enough green corn to last m test cows for a day. This was the only way I coul get it and I knew they wanted it. My experienc has been that all cows do not care particularly fo green corn but this lot did and I was bound to pro vide them with it. If a cow likes a feed she mus have it or she will not make her best record. A sudden change in feeding is a very bad practice If I find that there is going to be a shortage of particular kind of feed I like to take six weeks t make the change to the feed selected to take it place. This is the only way to sustain milk flo and get the cows to produce maximum flows o milk."

It is these things, considered not worth while a fairs by most people, that have made Mr. Gocker so highly successful with cows. His services are i demand by the best breeders in the country an at a remuneration far above that of the colleg professor. It is the little things that make for suc cess in dairying and build fine herds of large pro ducing cows.

AGAIN, THE SILO

Through the alchemy of the foster mother of th human race the roughages of the fields and the by products resulting from the manufacture of foo are transmuted into milk,—Heaven's true ambro sia, a gift of life to the growing child and the sus tenance of man in his hours of labor. By what pro cess of physiological chemistry the cow change feed into food we do not know, and we may neve know, but we do know that she has been endowe by the Creator with the ability to do this and do i more efficiently than any other animal. Not onl this, but she is the great conserver of human foo for she largely consumes inedible material tha without her would go to waste. For this she de serves the consideration of man.

Intelligence, thrift, and painstaking care are re quired of her owner if she is to do her work we and boost him up the ladder of success. He shoul see that the roughages which she is to consume ar suitable in order that she may be the more efficien One of these roughages is corn, and that she ma make the best use of this plant it requires a silo t best preserve all its value as a feed. The silo ha been placed in the balance, and it has not bee found wanting. It has stood the test of time, an is no new fledged idea or innovation. In practicall every community it stands a beacon light showin the way to more profitable milk production and th cows it feeds rise up and call it blessed.

In this day and age there are few men who dar to say the silo is not good. Indeed, most farme without a silo will assert that they intend to buil but for one reason or another they procrastinat What is needed is to put decision into action. Th man who waits is lost. Returns come to him wh does. We are charmed with the word, success. W all want it, but wanting is not enough. Invest gate, contemplate, then decide and act.

Yes, buy that silo now, tomorrow is too late.

ADVERTISING DAIRY PRODUCTS

A few people have always fully appreciated tha milk is an important part of the diet for human b ings. The rank and file have used milk and its pro ucts more as a relish than as a food. Milk, crea butter, and cheese have never been used liberal in the American homes. Even the producers these products have used them sparingly.

If twice as much milk were produced and co sumed, either directly or in some dairy produc our people would be better nourished and a stron er people. The main reason why dairy produc are not used more is that people do not know the food value. Recent experiments have shown co clusively that milk is a necessity. This fact mu be carried to the consumer. Further, he must lea that milk is one of the cheapest animal foods. quart of milk is equal to one-half pound of be and a pound of cheese is equal to one and one-ha pounds of beef.

When the consumers know how important m is to the growth of children and its real food val for themselves they will complain less when advances one cent a quart. The way to carry th important information to the consumer is throu the schools, doctors, health officers, public demo strations, and systematic advertising. The dai industry has a great future when people are fu advised regarding the importance and food val of dairy products.

Ensiling Corn Stover With Molasses

Would like to have your opinion as to our plan f filling our silo this fall. First, will husk our orn, except the nubbins and immature ears; sec- nd, will tie the fodder in bundles, stack it, and hen cut it into silo, with our own help, after the ll work is finished. Expect to use plenty of wa- r and molasses. Could you tell me the quantity molasses to use per ton? Could you inform me here I could purchase the molasses at a fair rice?

Bridgeport, W. Va. P. K. S.

I do not believe there would be very much gained y adding molasses to the corn fodder. In the rst place, it is not necessary to add molasses to ie feed in order to help preserve it; and in the econd place, if molasses is added there will be onsiderable fermentation and you will lose a good eal of the feeding value in this way. If you de- de to add molasses to the fodder, I would suggest at you do not add more than one part water to n parts of molasses, by weight. You should use ution in adding water—the molasses is very sol- ble in water and if too much is added the water ill carry the molasses down to the bottom of the lo.

Kansas Agricultural College. O. E. REED.

Partition in Silo

I have a reinforced concrete silo 10 by 45 feet. y herd is not large enough to keep the silage od in warm weather. What would you think of tting a partition in the middle, 15 or 20 feet gh? If any of your readers have written any- ing about it I have not noticed it.

Coldwater, Mich. W. E. B.

A partition such as suggested may be placed in silo and give fair to good satisfaction. However, ere is some danger that, in extending it only a rt of the height of the silo, it will cause the si- ge to settle unevenly and the air pockets that ay be formed will tend to make the silage some- at moldy.

Some men who have put a partition from the top the bottom of their silos report that it results in mparatively little additional spoiling of silage, ile others are quite as convinced that it has not oven practical, or, rather, that the expense was t warranted when other means could be adopted ere only a little more spoiling would follow. building such a partition, care should be exer- ed to round the corners where the partition ins the silo wall and extra care should be taken tramp the silage well on each side of the parti- n. It is possible that the two-by-four studs uld be omitted entirely where both sides are ed at the same time. This will help to obviate e difficulty of securing solid packing of the silage the side into which the two-by-fours project. cept as a provision against warping of the par- ion there will be no particular necessity of put- g in braces as the silage is removed, for as the age becomes thoroughly settled there is but very tle lateral pressure.

One of our New York subscribers wrote us about year ago that he adopted the following method overcome spoiling where the silo was too large r the number of cattle fed. He says:

"I feed silage nearly all summer and have very tle spoilt feed and I think if others follow my an they will find the same. When I turn cows to sture in spring I cover the silage with wet straw. it is not wet enough I soak it well with water, ing about eight inches of straw and tramp it ll. When the pasture gets short I uncover one- lf of the silo; then take an ordinary straw knife d cut across the center; feed down one-half out two feet; then throw down my wet straw d feed down the other half, which gives me a ange of the mulch or straw about every four et. The silage will not spoil in at the cut edge re than about three inches, which can be easily rown off onto the straw cover below."

A Michigan subscriber who at first followed the actice of cutting the silage in two and feeding m one-half the silo at a time, writes that he und this method unsatisfactory. He finally de- ed a new method that resulted in very little oilage when silage is fed slowly. He reports that has fed out as little as three feet in depth for days in summer, or an average of only 1.2 inch- per day. His method is as follows:

"In the afternoon when the silage is gotten out r the evening meal, fill up the car the second ne for the morning meal. In getting out this si- e at one time for the 24 hours' feed be sure and over the whole surface at just the proper depth u want to take out for both feeds and do not dig any below what is taken out so that the surface y be left as hard and firm as possible. The next morning take two pails of water and a sprinkling can, go into the silo and sprinkle the surface silage thoroughly, especially around the edge. Repeat this process every morning and ensilage will keep very nicely even when as little as an inch and a quarter is taken off each day."

Another Michigan subscriber reports that where he used to throw away about one-third of his silage, he now has a method whereby there is very little wastage. He uses band iron covered with canvas made in such form as to fit the inside of the silo, the canvas being treated to make it air tight. This form is raised and lowered by a pulley to allow for putting down the feed. He takes out enough silage at one time for two feedings. He states that he has fed as little as 24 inches from the top of the silo in 30 days and there was none that was spoiled or moldy. He also states that the silage covered with this protector always retains its moisture even at the surface. This is, of course, an adaptation or improvement of the older method of covering the silage with wet straw or gunny sacks and removing silage for a few days' feeding from one-half of the silo; then throwing the wet straw or gunny sacks on to this uncovered half and feeding from the other side.

Hot Iron Dehorning

I noticed in a recent issue of Hoard's Dairyman that J. V. M. of New Mexico uses a hot iron for dehorning in preference to a chemical dehorner. I would like to know at what age he does the dehorning and if an iron pipe could be used instead of an iron especially made for that purpose. As I have some dehorning to be done this fall, I am particularly interested in the best method to use.

Uniontown, Pa. W. L. S.

I have used my soldering iron (heated by a gasoline blow torch), the sharp or threaded end of a wagon box rod and a ring made from a ⅜" rod by simply turning the end into a tight ring to fit over the button. All have been successful. It is not so much what it is done with as how well it is done, as is the case with caustic. The soldering iron is good but slow as the end is pointed. I will tell you how I have planned to make my iron.

As copper is the best kind of branding iron I am going to use a soldering copper, good size so it will hold heat well. Will file the pointed end down to where it is all the same size. Then use a bit, for boring in steel, with a slight bevel so as to make this newly made surface slightly concave to fit over the button, then dress down the copper all around so it will have the form of a ring with the outside edge rounded. This will be an iron easily handled and easily applied; will hold heat the longest too.

I don't know how late in life it can be done successfully, but this I am sure of, i. e., it can be used as late in life as any of the horn stops. I burn them at from 3 to 10 days of age. In my opinion an iron pipe will not be a success as it will not burn all of the surface. Every particle of the button and around it must be seared.

I hope this will become a common method of dehorning calves and then we will not need to have the sticks of caustic for our little ones to come in contact with.

Elida, N. Mex. J. V. M.

Hay and Grain to Cows on Pasture

Will you kindly suggest a grain ration for grade Guernsey and Jersey cows on pasture? My pasture is getting very short and they need something more. I have corn, bran, 36% cottonseed meal, and a little corn distillers grains, and can get at market price any other feed needed.

Aberdeen, Md. F. H. B.

It is economical to give cows additional feed at this time of short pasturage. The mistake is all too commonly made on our farms of allowing cows to get into thin flesh at this time, when a relatively small investment in feed would keep them in good producing condition and would greatly increase their production both at this time and for the months which follow.

The most economical supplementary feed which can be supplied depends in part upon the prices of feeds at the local station. If a good quality legume hay can be secured, we would by all means advise feeding it liberally at this time. At usual market prices it will supply nutrients more cheaply than they can be purchased in concentrate feeds.

In addition to feeding such a hay, a grain mixture made up of 300 lbs. corn, 200 lbs. bran, 100 lbs. cottonseed meal, and 100 lbs. distillers grains will prove highly stimulating to milk production and will be a profitable investment if given to the heaviest producing cows. For cows producing as much as 20 to 25 lbs. of milk, we recommend that such a mixture should be fed at the rate of one pound for each three to four pounds of milk produced.

Dairy Production Statistics

A correspondent has asked for information concerning dairy statistics of the several leading dairy states. The following facts have been received in reply to inquiries to the Department of Agriculture of these several states:

Wisconsin

Wisconsin has 1,800,000 dairy cows and produced dairy products in 1917 with a total valuation of $190,235,914.72; 747,540,078 lbs. of milk were used by condenseries which paid the producers for this quantity of milk, $22,358,058.95. Cheese factories manufactured 277,267,444 lbs. of cheese with a total value of $63,470,882.69. The creameries manufactured 111,325,285 lbs. of butterfat with a total value of $39,583,037.96. Market milk was sold to the quantity of 99,792,538 lbs. with a total value of $2,678,963.44. The ice cream manufactured in the state was valued at $1,395,065.20. Whey cream was calculated to have a value of $1,294,522.25. It is estimated that $16,220,045.60 worth of skimmilk was fed to live stock. Also the whey produced from cheese factories was valued at $11,045,843.76. Farm made butter and cheese with the milk and cream shipped out of the state (not going to milk plants) was valued at $5,537,862.

Michigan

Michigan has approximately 843,000 cows with an average yearly production of 4,000 lbs. milk containing 160 lbs. fat each. The total annual milk production, therefore, is estimated to be 3,372,000,000 lbs. Of this, 255,000,000 are used to make 102,000,000 lbs. of condensed milk; 42,500,000 lbs. are used to make 2,900,000 lbs. of ice cream; 75,000,000 lbs. go to make 7,500,000 lbs. of cheese; 1,330,000,000 lbs. are sent to the creameries and are used in making 53,200,0000 lbs. creamery butter; 657,900,000 lbs. of milk are used in making 26,316,000 lbs. of dairy butter. It is estimated that 1,011,600,000 lbs. are used as whole milk for cooking purposes. The total valuation of the dairy products of the state of Michigan for 1917 is estimated to be $66,000,000.

New York

New York has 1,351,572 cows with a total value of $126,237,824.80. They produce annually a total of 6,757,860,000 lbs. of milk, that is an average of about 5,000 lbs. each; 812 cheese factories produced a total of 71,454,000 lbs. of cheese; 311 creameries manufactured a total of 72,690,000 lbs. of butter. It is estimated that there is used on the farms and as market milk in the state of New York 4,330,000,000 lbs. of whole milk. The farm value of all the dairy products of the state in 1917 is estimated at $190,000,000.

Iowa

Iowa has 710,714 dairy cows which produced dairy products in 1917 totaling a valuation of $85,000,000. Creamery butter was manufactured in 462 creameries with a total value of $25,127,228.49. The total of the ice cream manufactured in 1917 was 5,318,100 gallons with a total value of $4,000,000. The market milk sold was valued at $20,940,000. It is estimated that $150,000 worth of cheese was made from 681,315 lbs. of milk. The value of the farm butter made totaled $22,649,337. Condensed milk with a total value of $588,000 was made from 17,298,808 lbs. of milk. The skimmilk and buttermilk of the state was given a value of $10,050,000.

Minnesota

In 1917 the state of Minnesota produced a total of 99,672,135 lbs. of butterfat and manufactured 122,104,895 lbs. of butter. $44,160,847.75 were paid to patrons and $49,126,646.24 were received for the butter manufactured.

Indiana

Indiana last year produced about 35,171,283 lbs. of butter and manufactured 2,124,626 gallons of ice cream and 63,916 lbs. of cheese. Condensed milk was manufactured to the amount of 2,925,130 lbs. and evaporated milk to the amount of 120,851 cases. Plain bulk condensed milk was manufactured totaling 422,720 gallons and enough butterfat was shipped out of the state to total 7,136,622 lbs.

Ohio

The dairy cow population of Ohio is approximately 940,000. The average annual milk production of the cows in testing associations is 5,760 lbs. and of all cows in the state, 4,900 lbs. The total value of the 1917 production is about $100,000,000.

Making Silage

In order to make good silage the crop must have a water content between sixty and eighty per cent; about seventy per cent gives the best quality of silage. With a water content toward the upper limit given, the silage will be very high in acidity, while if much below seventy per cent of water is present there is great danger of spoiled silage and white or other molds appearing in the silo. Silage from such dry feed is moreover not as palatable as that containing a normal percentage of water. A limited amount of water added at the time of filling the silo will aid in making silage of good quality from a crop that has been allowed to dry considerably before cutting.

Indian corn is preferably cut for the silo by means of a corn binder, at a time of approaching maturity, when the kernels are beginning to harden. Legumes are cut at the beginning of bloom, and the cereals when the kernels are in the milky state; in case of barley, rather before then after this stage. Sweet sorghums and grain sorghums are cut when the seeds are hard and fully matured. This is of special importance in the case of sweet sorghum, which will make a very acid silage when cut at an earlier stage of development.

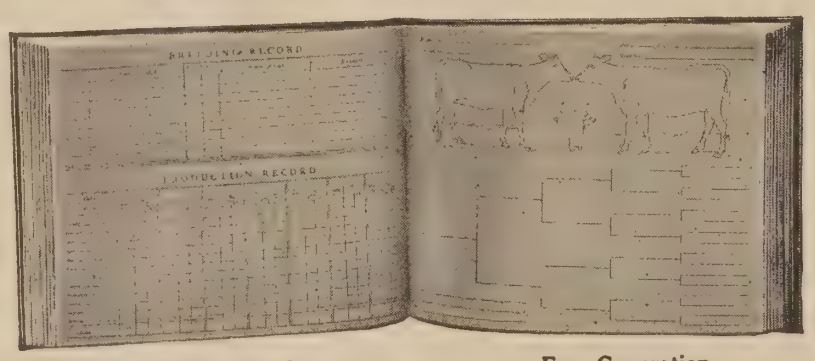
The Process of Filling the Silo

The silage crops are always run through a power feed cutter in filling the silo. This is not absolutely necessary, but makes it easier to both fill and empty the silo, and makes the fodder pack better than when siloed whole, thus increasing the capacity of the silo. A cutter of ample capacity (say five to ten tons per hour for a hundred-ton silo or less) should be provided, which will also elevate the cut mass into the silo by means of a blower operated by a high-speed rotating fan. It is advisable to shred or cut the feed fine,—in case of Indian corn and sorghum into half-inch pieces, and for cereals and other fine-stem forage into one-inch pieces.

During the filling of the silo one or two men must be kept in the silo distributing the cut mass and tramping it down carefully, especially along

THE KIND OF CORN THAT MAKES THE BEST SILAGE

the wall. A cement tamper may be used to advantage in this work which is of the greatest importance in securing good silage and minimum losses of feed materials in the siloing process. If need be, water can be added in the silo, during filling, by means of a garden sprinkler and the mass may be left to ferment and settle. Most farmers fill up the silo a second time after a few days to a week, as it will have settled four to six feet by this time in the case of tall silos that have been filled rapidly.



It is not necessary to put any cover on the siloed mass, but if desired a load of cut straw, marsh hay, chaff, etc., may be placed on top and thoroughly wetted, and oats then sown thereon; these will soon germinate and a heavy mat of roots and green stuff will form that will protect the underlying feed from decomposition.

The silage will be ready for feeding in two to three weeks after filling. In opening the silo the top six- to twelve-inch layer of spoiled silage is removed, below which a good quality of silage will be reached. The silage will improve in quality as the silo is being emptied until the last foot or two is reached, which will likely be

The Ball BLUE BOOK

Tells You ALL About Canning and Preserving

Edition "K" (1918) of the Ball Blue Book of Canning and Preserving will help you solve the food problem. Its 82 pages contain the best, tested and chosen recipes for every fruit and vegetable. It describes the cold pack and all other canning methods—plainly and simply. Tells how to can fruit without sugar. It is the acknowledged authority—places the experience of the most successful housewives at your service.

The Ball Blue Book has never been advertised before—this will be the only announcement in this publication this season because the supply is limited. If you want your copy, better write a note or fill in the coupon below with your name and address—NOW!

Ball Bros. Glass Mfg. Co.
Dept. "C" Muncie, Indiana

Mend Your Tubes As Good As New

SHALER

5-Minute Vulcanizer

Works automatically—without fail. Makes a perfect, lasting, feather-edge tube repair—anywhere on the road—in any weather—in five minutes. So simple a child can do it. No acid, cement or gasoline. Makes tube repairs far superior to any "stuck on" patch. Easily carried in tool box. Saves cost of spare tubes and repair bills.

Complete Outfit With 12 Patch & Heat Units $1.50

Comprises handy, nickel plated vulcanizer, 6 round Patch & Heat Units for punctures, and 6 oblong units for cuts and tears—(everything necessary to make 12 perfect, permanent tube repairs) with full instructions, only $1.50. (Additional Patch & Heat Units only 75c per doz.) *Buy from your garage or hardware dealer*—or we will send prepaid, guaranteed, by parcel post direct from factory if your dealer does not sell it.

Write for FREE BOOK—"Care and Repair of Tires"

Tells how to make your own tire repairs—how to increase tire mileage—how to prevent blowouts, sand pockets—general care of tires, etc. Don't fail to write for this valuable Free Tire Book now—before you forget.

C. A. Shaler Co., 4300 Fourth St.
Waupun, Wisconsin

rather acid if the siloed mass contained considerable water, or a good deal of water was added and the silo is not provided with a drain. If used for feeding, this sour silage should be fed to stock in only very small quantities.

Emptying the Silo

The silage is kept level in the silo all the time during emptying so that as little silage as possible is exposed to the air and secondary fermentations thus avoided. A sufficient amount of silage should be removed daily to keep the silage from spoiling, viz., one to two inches, according to the air temperature. The silage must be fed out more rapidly in warm than in cool weather. It is, therefore, important that the diameter of the silo be no greater than that the stock on hand will be able to eat a layer of silage daily of the thickness suggested.

Once sealed in the silo the silage will keep indefinitely without material changes after the first few weeks. Instances are on record of silage a dozen years old or more having been found of excellent quality and eaten by stock with great relish. If a silo is not completely emptied by next filling time the new crop may be placed directly on top of the old silage; if this is carefully leveled off immediately before filling there will be no spoiled silage at the juncture of the two crops.

In emptying the silo it is convenient, and in case of outside silos almost necessary, to provide a chute or conveyer through which the silage may be thrown directly into the feed truck or the wagon. The silage should be placed before the stock in one or two handlings and should not be allowed to dry out appreciably before being eaten by the animals, as it will otherwise lose some of its palatability. In the case of weedy alfalfa silage and barley silage the foxtail and barley heads, respectively, will soon dry out, if left exposed, at least in hot weather, and will be likely to injure the mouths of the animals, especially if siloed at a rather advanced stage of maturity.—DR. F. W. WOLL in California Circular 138.

More on O. P. V. Silage Mixtures

HOARD'S DAIRYMAN:—Corn in Northeastern Michigan has been a failure for several years and promises to be the same this year on account of cold weather and particularly cold nights. In a conversation with several farmers who have silos, practically all agreed that corn was a failure three out of five years. The writer suggested that Hoard's Dairyman recommended O. P. V. mixture. General interest was shown and questions asked which led to the writing of this letter.

Will you please state what quantity of oats, peas, and vetch you would advise planting on these sand lands of rather light character? Would you advise hairy vetch or some other vetch? Do you advise inoculation? As the entire mass will probably be a tangle, is it not difficult to harvest? Can it be harvested with a binder by first running a disk harrow over the field? In what stage must the oats be cut for most profitable harvest? Can the silage be fed to sheep as well as cattle?

A good substitute for silage corn would be a great blessing for the entire state of Michigan, with, perhaps, the exception of the southern tier of counties. You, or any of your readers, who can supply the above information would deserve our deepest gratitude.

Oscoda, Mich. C. E. S.

Your subscriber in Northeastern Michigan is evidently having the same difficulties with corn as a silage crop as were experienced by the farmers in the province of Nova Scotia on the Atlantic sea board of Canada when they first attempted to grow corn for the silo. Occasionally they would have a good crop, but more frequently, because of late and early frosts and the absence of hot, corn-growing weather, the corn crop would be a failure. A few years ago Professor J. M. Trueman, of the Nova Scotia Agricultural College, began experimenting with a mixture of oats, peas, and vetches for ensilage purposes. This mixture has now been tried out extensively, not only on the college farm but by numerous farmers over the province, and it has been proven that this crop will grow well and yield satisfactorily when many other crops are almost a failure. The crop was first grown on a commercial scale on the college farm in 1914 when 5.7 acres of land produced 65 tons of green feed, or at the rate of 11.4 tons per acre. The first three acres cut gave 45 tons, or at the rate of 15 tons per acre. The following year the average yield in the field crop was a little less than ten tons per acre and it has since been the general experience in Nova Scotia that on good land in proper condition they can easily raise twelve tons or more of O. P. V. ensilage per acre. This ensilage contains over eight per cent more dry matter than corn ensilage grown under the same conditions and in an average year the total amount of dry matter per acre will be more than the amount of dry matter per acre in corn.

The general run of soil in Nova Scotia tends to a light loam. There is very little heavy clay. On the college farm the soil is a gravelly loam, so I presume that the seeding mixture which has proven most satisfactory in Nova Scotia will be equally satisfactory for the light soils of Northern Michigan. It is two and one-half bushels of oats, three-quarters of a bushel of peas, and one-third of a bushel of vetch, making a total of a little more than three and one-half bushels per acre. The green material is cut just as the oats are about ready to enter the dough stage and before they begin to turn yellow. It is blown into the silo with the regular ensilage cutter. All kinds of stock eat this ensilage greedily and it is giving universal satisfaction. Common vetch is the kind usually used, but I see no reason why hairy vetch might not be substituted and perhaps it would make an even more satisfactory growth than common vetch on light, sandy land.

The mixture of peas, oats, and vetches is certainly a tangled mass, but this is one of the features which makes it easy to handle in harvest. Anyone who has forked green oats alone, knows how slippery and difficult they are to handle. The mixture of oats, peas, and vetches clings together and is handled as easily as it very well could be considering its weight. To run a disk harrow over the field would merely flatten the crop out and make it more difficult to handle. If the crop is very heavy it is most easily handled by forking direct from the swath to the rack. If light, it might be gathered in windrows with a hay rake. One farmer in Ontario who has experimented with a mixture similar to this for the silo, loads it directly from the swath with his hay leader, thus getting the crop into the silo with a minimum of hand labor.

This crop is at its best for silage when the land is given good preparation and manured just as heavily as it would be for corn. There is an opportunity to clean the land either by summer fallowing early in the season and then sowing the O. P. V.

(Continued on page 112)

Holding Up the Nation's Defense

The telephone played a tremendous part in this Nation's mobilization for war. It continues vital to the Government's program.

At the same time it has remained at the service of the whole people whose demands upon it grow apace with that of the Government.

The public is entitled to tne best service that it is possible to render. But the public has a partnership in the responsibility for good telephone service.

It takes three to make any telephone connection: the person calling, the company, and the person called. Without the co-operation of all three the service suffers.

The telephone company can make the connection, but no words can be heard at one end of the line which are not properly spoken into the transmitter at the other. The relation between the speaker and the hearer is the same as the relation between the orator and his audience. It cannot be maintained if the orator turns his back to the listeners or if the audience is inattentive.

Telephone traffic must be kept moving. Speak distinctly—answer promptly—and release the line as quickly as possible. Don't continue reading when the bell rings.

These seem little things to ask the individual telephone subscriber, but when the individual is multiplied by millions all over this country, it is easy to see how important it is that *all* should co-operate.

Which is the Best Silo?

(Continued from page 97)

darity because of its barrel-like structure.

The Silo That is no Good

Of all the silos the one that is absolutely no good is the one that you dream about. Action is what counts. Put it off this year and you will put it off next year. If you cannot get one any other way put yourself in the way of a good salesman and put your name over the dotted line. Then you will have one. Co-operate with your neighbors to make a car lot shipment to reduce freight and price. If you do not have the money see your banker. Borrow at seven or six per cent and make thirty per cent. The silo will pay for itself in three years, quite often in one.

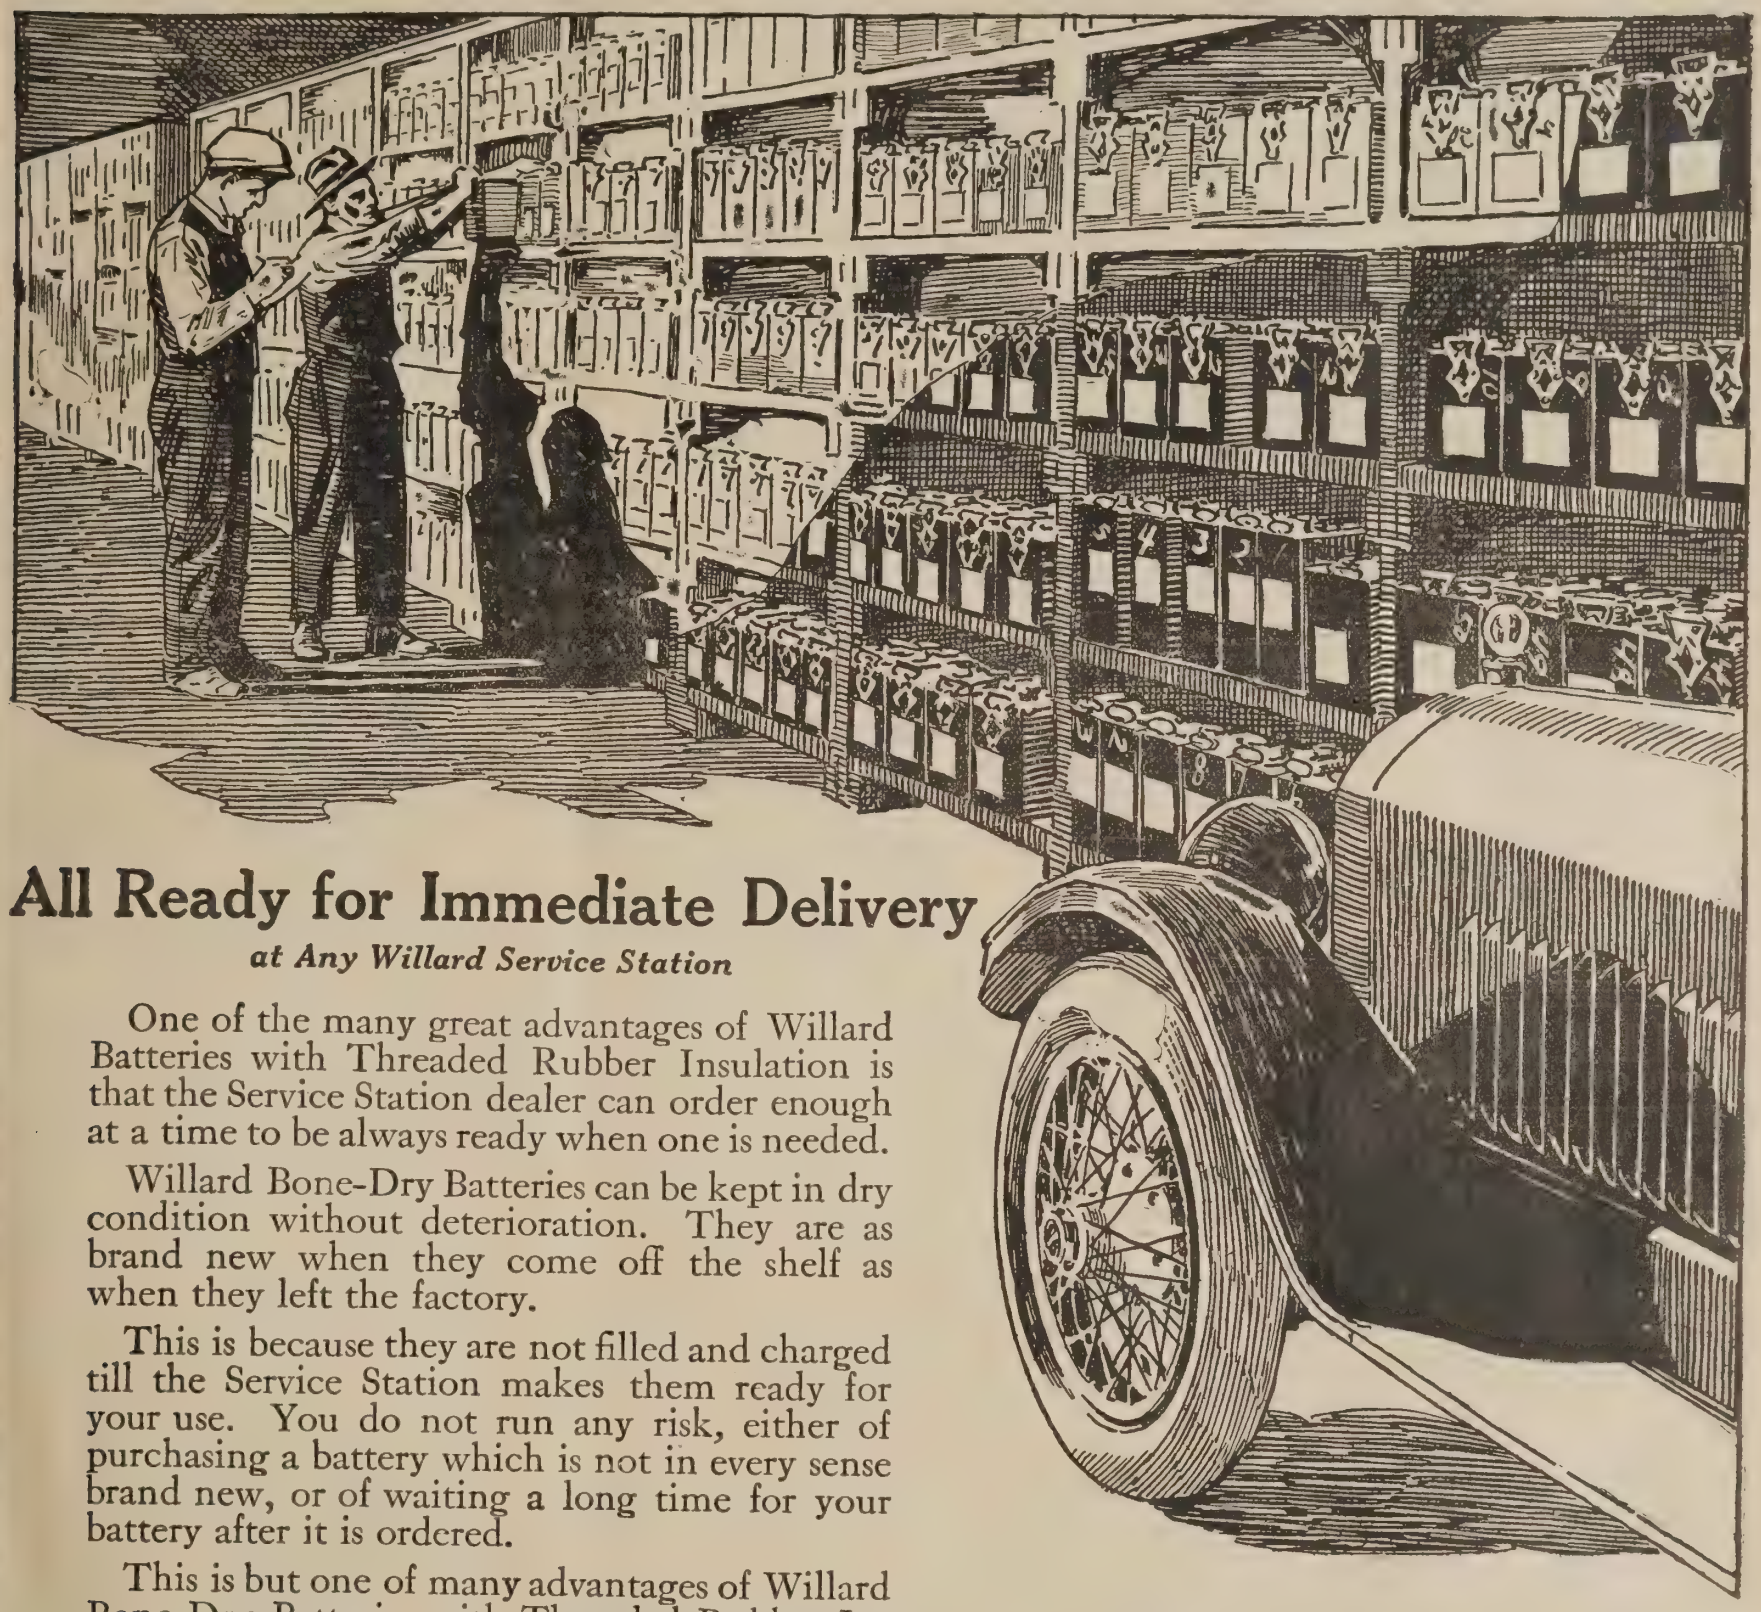
Food Reserves and Fire Hazards

The United States Food Administration issues the following statement of fire hazards in rural districts and the importance of safeguarding the nation's food supplies against this danger:

The season is at hand when farmers are to fill their barns with hay and grain. This period, when barns, granaries, and storehouses contain the greatest amount of food supplies, is also the time when they are most liable to fire destruction.

Farmers are the only large handlers of food supplies upon whom the government depends, entirely without supervision by inspector, to guard their holdings against losses by fire; and in view of the supreme importance of guarding this season's stored crops, farmers are asked to consider destuction or spoilage of food through fire as a misfortune to the nation and the allies as a personal loss to the holder.

Prominent among the many sources of fire in rural districts are lightning, defective flues and stoves, spontaneous combustion, carelessness with matches, incendiarism, and sparks from chimneys and locomotives.



Effective means of fire prevention and control are understood by the majority of property owners, but particular attention is called to the importance of removing inflammable trash from the vicinity of buildings, and to adequate equipment in ladders and buckets when more modern equipment for extinguishing fires is lacking.

Properly installed systems of lightning rods and conductors are suggested as protections against lightning. The paramount thought is to save from loss not only farm buildings, but the food and feed they contain.

It will be remembered that famine in ancient Egypt was prevented by a little governmental foresight, and it does not require any illuminating dream to anticipate that so long as the war lasts, with its increasing drafts of soldiers or ammunition workers, the world will steadily produce less and less food. If this year's harvests prove abundant, it will be the first duty of the American people to place every grain they can save into storage for future need.

In 100 lbs. of timothy hay there are 48.8 lbs. of digestible nutrients, or nearly three times as much as there is in corn silage. Corn silage, being a succulent feed and more palatable is, on the whole, more easily digested. We have always calculated that one ton of timothy hay is equivalent to about two and a half tons of corn silage. Putting it in another way, when timothy hay is worth $10 a ton corn silage is worth $4.

Bone-Dry Batteries

All Ready for Immediate Delivery

at Any Willard Service Station

One of the many great advantages of Willard Batteries with Threaded Rubber Insulation is that the Service Station dealer can order enough at a time to be always ready when one is needed.

Willard Bone-Dry Batteries can be kept in dry condition without deterioration. They are as brand new when they come off the shelf as when they left the factory.

This is because they are not filled and charged till the Service Station makes them ready for your use. You do not run any risk, either of purchasing a battery which is not in every sense brand new, or of waiting a long time for your battery after it is ordered.

This is but one of many advantages of Willard Bone-Dry Batteries with Threaded Rubber Insulation. Write for free booklet, "196,000 Little Threads."

A Suggested Abortion Remedy

HOARD'S DAIRYMAN:—Have just read your article on Infectious Abortion and will send you my cure for this disease. For each animal take one-half pint of hops, boil in one quart of water, and feed in enough bran to make a crumbly mash. Repeat the dose once every month for one year, after that one dose to every animal in the herd once every three months, and you will find the herd free from abortion.

This treatment is so simple and inexpensive that many people think it is no good, but try it and see.

Bedford, Pa. R. S. L.

[EDITOR'S NOTE:—We have never tried this remedy, and unless the scientists are wrong, it will offer but slight relief from the curse of abortion.]

Blood in Milk

I have a cow four years old that has given bloody milk in one quarter for two or three weeks and it does not get any better. Sometimes when the milk first starts there are clots of blood that come first and then the milk is tinted with blood until nearly done, when it is very red. The quarter shows no signs of any bruise or injury in any way.

Red Creek, N. Y. C. E. R.

Growths in the teat probably bleed from irritation at milking time and in such cases an operation by a skillful surgeon sometimes succeeds but often it is found best to dry off the milk secretion in the affected quarter. If you cannot find evidence of growths, milk gently three times daily, bathe the quarter with cold water, and each night mix in the feed a level teaspoonful of powdered copperas and three of salt but not if the cow is advanced in pregnancy.

Purulent Mammitis

We have a pure-bred cow that went through a wire fence and injured one of her quarters on the corner brace in the fence and the teat opening seemed to grow up at once. We were unable to get a teat plug for about seven weeks. In the meantime I used a medium sized milk tube to milk her with, being what I thought was careful in boiling it every day. The teat gradually became irritated from the end up and finally got so sore inside that I had to tie her legs down in order to get the milk tube in to milk her. In the course of time the quarter became caked very bad and I spent a great deal of time in applying hot towels, etc., but of no avail. The quarter at present is broken open in two places. In fact, one of the places appeared to be decayed, but that has passed and seems to be healing.

Tony, Wis. H. B.

The quarter is permanently ruined for milk production and infection may be spread from such a cow to other cows by the milker's hands, or contact with contaminated floors or ground. Isolate the cow and milk her last. Split open the tip of the affected teat or amputate a small portion to establish free drainage, then syringe out twice daily with warm water containing a dram of permanganate of potash to the quart. If necessary, gradually increase the strength of the injection solution.

It is suggested to farmers and dealers that everything should be done to conserve straw this year on account of the reduced returns in the cutting of hay which is being harvested. Those having any straw for sale are requested to communicate with Mr. George S. Bridge, Chief of the Forage Branch, Quartermaster's Department, Lytton Bldg., Chicago Illinois.

Have you talked with your neighbors about subscribing for Hoard's Dairyman? Why not do it now? Make up as large a club of subscribers as you can and send them in.

Association Notes

Walla Walla, Washington: During the past month Dr. Pelton, State Veterinary Inspector, tested 515 cows in the Valley, only two of which were reactors. This shows that the herds were 99.6 per cent pure. In both cases where reactors were found the cows were in apparently the best of health and were among the highest producers in the herds. All of which goes to show that testing is the only sure way to detect the disease.

Wahkiakum, Washington: Frank Durrah has just completed a new milk house, built of concrete, at a cost of about $1,000; hot and cold running water, hot water heated in a pressure tank by a three-burner kerosene heater. Skimmilk runs directly to hog house from separator through a 2-inch pipe. Has installed a milking machine and is running the whole works by electricity, which is stored up by a 3-horse gas engine.

W. E. Brown is milking 19 cows and has 8 head of young stock. He has about 24 acres of pasture and this is cut up into 11 pastures. In this manner he is to have fresh pasture at all times. Frank Smalley is building a stay-round silo, 75 ton capacity. Alex Campbell has just purchased a milking machine, P. C. Olsen has a new 2-unit milker and H. L. Weister has a new 3-unit milker. Wm. Lund has just purchased a pure-bred Holstein bull from the Hollywood Farms. P. C. Grungstad has a 2-unit milking machine.

Iowa Associations: Last year members of Iowa cow testing associations saved $4,392 by buying 457 tons of cottonseed meal co-operatively.

In June 3,725 cows were tested in Iowa associations. Fifty-eight cows were sold by members and 27 bought. Seven pure-bred sires were purchased. The number of cows producing more than 40 lbs. fat each was 217; more than 50 lbs., 52.

Highland-St. Jacob, Illinois: Our farmers are buying a good deal of their winter feed now, especially bran which is quite cheap at present. The association is in its second year, but it is still turning out "boarders" from the herds. One member who has been testing for five months says he finds his cows increasing in milk flow each month and because he has changed his ration he finds that it does not cost as much to produce milk as before. In July, milk testing 3.5% sold for $2.30 per hundred lbs. Our members pay $1.40 per hundred for bran, $3.25 for cottonseed meal, $3.25 for linseed meal, $3.00 for ground corn, $2.40 for Sucrene, $2.75 for gluten, $2.00 for corn and cob meal, and $2.25 for ground oats. Our charge for pasture is at the rate of $2.50 per cow per month.

Laurel Hill, Pa.: Nine unprofitable cows were sold during June. In that month our members received $1.73 per hundred lbs., a test of 3% being required. The creamery paid 56.1 cents for fat. Milk retails for 9c, butter for 50c, and cheese for 45c.

Canton, Pa.: Several of our members have already bought their winter grain. Three per cent milk was sold in June for $1.69 per hundred lbs. Pasture costs $1.50 per cow per month; gluten, $45 per ton; bran, $45; hominy, $63; Schumacher, $60; hay, $12; silage, $5; and green feed, $5.

Troy, Pa.: Pure-bred sires have lately been purchased by members. Milk testing 3% sells for $1.68 per hundred lbs.

Eastern Bradford, Pa.: The June price for 3% milk here was $1.74 per hundred lbs. The creamery paid 46c for fat and retailed butter for 42c to 45c. Gluten is priced at $2.65 per hundred lbs. Cottonseed meal, $2.95; wheat bran, $2.35; brewers grains, $2.70; corn meal, $3.85; and wheat middlings, $2.25.

Lake Co. No. 2, Illinois: Poor pastures and empty silos didn't give the dairyman much encouragement this month. Thirteen head of pure-bred cattle were purchased by members and several more are in the market between now and this fall. The difference in production between good and poor cows is so great that there is an abundant opportunity for improvement all the time. Market milk sold for $2.30 per hundred lbs. The test required being 3.5% and, for each point above, 4c were paid. Creameries paid 46c per pound for fat. Prices of feed were: Oats, 70c; oil meal, $60; Schumacher, $56; bran, $38; and Sucrene, $48. Pasture is figured by this association at $1.50 per head each month of 30 days.

Geauga Cow Testing Association, Ohio: In June market milk sold for $2.00 per hundred pounds. The average test required was 3.3 per cent and, for each point above, 4c were paid.

May Irwin and Jerseys in Film

Many breeders of Jerseys in the vicinity of New York City were present at the Broadway Theater, New York, on July 30th to witness the first showing of the American Jersey Cattle Club's new motion picture film, "Hearts and Jerseys," in which May Irwin, the famous comedian and devotee of Jerseys, plays the leading role.

The play was produced by the Universal Film Company of New York, and was pronounced by prominent dramatic critics to be one of the best pictures of farm life that has yet been put on the screen. It will be used by the American Jersey Cattle Club at breeders' meetings and agricultural conventions in various sections of the country. Parts of the film have already been used in food conservation programs to bring forward vivid examples of the pure-bred Jersey cow's ability to produce a high quality of dairy products at a low cost in food consumption.—AMERICAN JERSEY CATTLE CLUB.

Restaurants and hotels are restricted to two pounds of sugar for every ninety meals served. This includes sugar for the kitchen as well as table use.

Universal natural milker

An Investment That Pays For Itself Each Year

Farmers must do more these days than ever before and with less men. This makes every *tried*, time-saving device more important.

That is the reason you should have a Universal Natural Milker on *your* farm.

Its alternating action milks two teats while relieving and massaging the other two.

The rubber lined Universal teat cup fits all cows.

These Universal superiorities mean more contented cattle, more milk, less bother, and result in the Universal being a good investment for every farm.

You need but *one* Universal—It lasts a life-time.

It is simple, dependable and always ready to work.

No holidays, always on the job at milking time.

Put Universal to work on your farm today. Increase your profits.

See our nearest dealer or write us.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

The Pettis County, Missouri, Plan of Calf Clubs

HOARD'S DAIRYMAN JUNIORS:—A year ago last February the County Agent of Pettis County decided that the best way to encourage boys and girls in club work and at the same time conserve the calves that are going to slaughter would be to get the boys and girls to take these calves and raise them. Two obstacles were in the way. One was that the boys and girls as a rule did not have the money with which to buy these calves. The other was that many did not have sufficient milk to raise them. The former obstacle was easily overcome by getting the bankers to cooperate. They readily agreed to loan the club members the money for one year on their individual notes at 6%. It was further agreed that an auction would be held at the end of the year to give the members an opportunity to sell and pay these notes. It was decided to let each member have two calves so that they could sell one and pay the note and still have one left.

A note and contract was worked out, also an insurance contract. According to the insurance contract each member deposited with the Farm Bureau 10% of the purchase price of the calves. This 10% was borrowed along with the rest.

The contract stated that if the losses in the entire county did not exceed 10%, the Farm Bureau would pay the notes of the losers. If it exceeded 10% the loss would be prorated. Whatever was left from paying losses would be pro-rated back to the club member. This safeguarded the banks and protected the club members from the danger of coming up at the end of the year with no calves and a debt hanging over him. Incidentally it was a good lesson in co-operative business.

The second obstacle might seem to some to be insurmountable. However, the county agent had been experimenting along this line for two years with his own boy. The boy and one cow had raised eleven calves in nine months and had thus demonstrated that calves could be raised with no whole milk and very little skimmilk, and by a boy at that. Accordingly this method was carefully written to give to any club member who might need it. The offer was made to furnish the calves of either beef or dairy breeding to any boy or girl in the county between the ages of 10 and 18 without the payment of any cash. They were urged to take the calves if they had as much as two gallons of skimmilk for thirty days, by which time they could be eating Farm Bureau calf meal made according to the directions of the county agent.

Fearing that too many might want calves they were limited to the first 100 that might apply. The fears on this score were groundless. Many farmers in Missouri do not believe you can raise a calf fit for anything on skimmilk. They say that they are "knocked in the head with the churn-dasher." When the agent suggested that they raise them practically without milk of any kind they just knew he was crazy and did not always refrain from saying so. After much talking and some persuading forty boys and girls were induced to take two calves each. Many had never attempted to raise a calf on the bucket and several had only the minimum amount of milk. Arrangements were made with the local miller to mix the calf meal they were to use.

A large commission firm in Kansas City agreed to purchase the beef calves from among those dropped in the yards. The dairy calves were purchased from farmers in Wisconsin.

The calves were shipped in by express two at a time. A fine lot of dairy heifers were procured. They were 5 to 6 weeks old, large, well marked and practically pure-bred but could not be registered. They cost $20 at the stations in the county. This plus the insurance made the club member's notes read for $44.44.

The beef calves were not of so good quality. Many of them carried some Jersey blood. However, they cost less. They averaged $12 at their home stations. The calves arrived in pairs covering a period of six weeks. When a goodly number had arrived trouble began to brew. Club members would forget to follow instructions closely and scours would result. By the judicious use of formaldehyde and blood meal most of the cases recovered. Out of fifty Holsteins there was only one loss from scours. One loss was from blackleg although they were vaccinated. Out of thirty beef calves five were lost, four from indigestion and one from accident. The beef calves proved so much less hardy that only Holsteins are being put out this year.

The fun came at the show and auction. Some of the members lived so far away that they could not bring their calves to the county seat or thought they could not. Twenty-eight came in bringing 45 calves. The extension man who judged them said he had never seen as fine a lot of Holstein heifers in the state. They were quite uniform in color and size. They were in good condition and made a fine showing. Prizes were offered for the best Holstein calf, the best pair of Holstein calves, the most profitable Holstein calf, and the most profitable pair of Holstein calves. Likewise in the beef calves and the sweepstakes on individual and pairs the most profitable individual and pairs.

CLIFFORD CUMMINGS—PETTIS COUNTY, MISSOURI, AND HIS PRIZE HEIFER

He won 1st prize and the sweepstakes prize with her. He got her when she was 4 weeks old and sold her as a yearling for $125.

The Holsteins won the sweepstakes in every class. The boy that won first in the show class did not win in the most profitable class.

The most profitable heifer made the club member $46.00 over feed cost and feed.

The pair made $71.00. They were grown by Ralph Hall of La Monte.

KATHERINE JOHNSON AND HER FIRST PRIZE BEEF CALF—PETTIS COUNTY, MISSOURI

The show class was won by Clifford Cummins of Hughesville. The greatest excitement came at the auction. The prize heifer brought $125.00 and was bought by the member who produced her. He refused $130.00 for her after the sale. The pair of prize winners brought $220.00.

"The Most Profitable Calf" brought $96 and the pair brought $170.00 which shows that they too were good calves.

The 44 calves cost a year ago $820 and sold for $3,180 or an average of $70.10. The beef calves averaged $48.00 and the Holsteins $76.90. These prices alone show whether or not the calves were well raised. Seventy-seven dollars is pretty good for grade heifers from 12 to 14 months of age. That the club members are well pleased is shown by the fact that nearly all have received calves for next year. Only Holsteins will be put out this year as they have proven themselves more hardy. Seventy of these have already been received.

The Pettis County plan, it seems to us, has several points of advantage over the plans where yearling heifers are bought and placed.

In the first place it is not much of an achievement to take a heifer 10 to 18 months old and turn her on grass for awhile then let her winter with the rest of the cattle. It is a real achievement to take a baby calf 3 days to four weeks old and raise it by hand and then carry it through the winter. Our club members are learning what many grown-ups do not know,—how to raise a calf.

Then, by buying the smaller calves, it requires less to buy two than one large one and the club member has a chance to work his way out. Thirdly and not of the least importance, these calves are saved to the beef and dairy industries by the work of the club members. If they had not taken them, in all probability they would have been slaughtered as veal. The older calves are already safe from that that danger. We believe Pettis County has hit upon the calf club plan that will eventually be universally adopted. It is with keen delight that we note that since this work was started here a year and a half ago there has developed a national movement with headquarters in Chicago to save these baby calves.

Missouri. COUNTY AGENT.

Junior Letters

Hoard's Dairyman Juniors:—I received your letter and fob, button, and creed also.

My brother and I were weeding onions this morning and this afternoon mother helped. We have one acre and we are weeding them for the second time. The onions are growing fine and they are from three to thirteen inches long. Yesterday I went visiting and my brothers went fishing. They got thirty fish, but they were small.

My father owns seven Holstein cows and he has seven calves from them all. My mother has about 250 hens and 375 spring chickens. I feed them in the afternoon. They are the Single Comb White Leghorns. I buy War Savings Stamps with the money I earn. I have two large stamps and I will get some more soon.

Minnesota. Johanna Uitdenbogard.

Hoard's Dairyman Juniors:—I read the Junior page every week and enjoy it very much.

Have any of the juniors any Belgian hares or white rabbits to sell?

We have about 300 little chickens and about 175 little pigs.

Well, as my letter is getting rather long I will close with good wishes for the juniors. My address is Elgin, Nebr.

Katherine Freese.

Hoard's Dairyman Juniors:—Pa sold my pig three or four months ago and got $32.50 for it. He has still got the money.

Can you or any of the juniors tell me how to break a calf to drive? Am anxious for an answer.

I have a half share in a sheep with my sister. Papa gave it to us. My two older sisters have one together.

Flanagan, Ill. Albert E. Post.

Hoard's Dairyman Juniors:—I have a sow of my own. I might sell her for $28. She is a Berkshire. We have two grade Holstein cows and one Holstein heifer and an Ayrshire. We have a brood sow which has had one litter and is going to have some more this fall. Our farm contains about twenty acres. We planted 1½ acres. Our Ayrshire heifer comes fresh this month. We have about 100 chickens. They are all Rhode Island Reds. We had a hard rain storm here Friday. Twenty-nine of our chickens got wet and one of them died. We have over 100 hens, Rhode Island Reds, Plymouth Rocks, and some blue hens. In our woods there is a big rock and you can get on the top of it and see for over 4 miles. I will close wishing the juniors good luck.

Rhode Island. Alston Spencer.

Hoard's Dairyman Juniors:—I have not written to you in a long time. In your letter you asked me how maple sugar was made.

Along in March the sugar maker begins to look for signs of warm weather. When it comes he goes into his woods and taps the maple trees. There may not be a run for a week or ten days, but in that time he can get his sugaring apparatus in readiness and get up a little more wood. When the sap comes it must be gathered and boiled down to syrup. If you use a thermometer it must be up to 219° F. If you don't use a thermometer you can tell by the way it leather-aprons.

After that it is taken to the house and put in gallon cans. At some places it is canned at the sugar house. We can ours at the house. This year we made about 313 gallons of syrup.

The horse that had the sore leg got well and we sold her. We have got nearly done planting now.

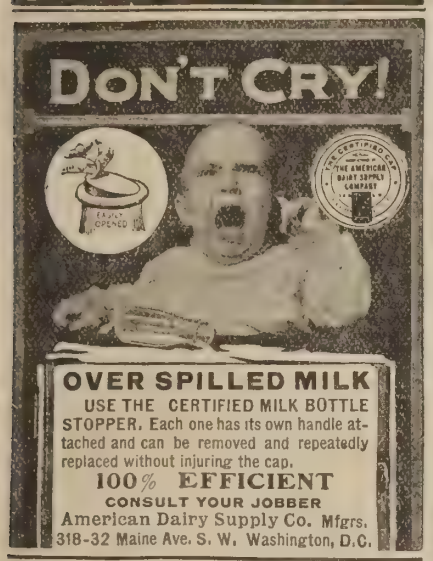
There are several cases of measles around here. I am just getting over them. I have my garden all planted and it is up. I have 14 chickens now. If any of the juniors wish to write to me my address is Dinmouth, Vt.

Ray O. Wilbur.

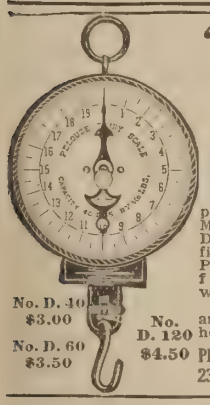
Hoard's Dairyman Juniors:—This is my second letter to the Junior Department. I have not written for a long time. I have been very busy at school work.

We are milking sixty-three head of pure-

Better Butter Prices



Customers willingly pay *more* for butter they know is *perfect*, just as first churned.



Pioneer Parchment Paper keeps it clean and sweet. Makes butter *worth* more, and *sell* for more. The cost of Parchment Paper is small. The extra profit more than justifies it.

Our free booklet, "Better Butter" is your money-maker. Send for it.

FARM WAGONS

High or low wheels—steel or wood—wide or narrow tires. Wagon parts of all kinds. Wheels to fit any running gear. Catalog illustrated in colors free.

Electric Wheel Co., 31 Elm St., Quincy, Ill.

bred Holstein cattle and ship 140 gallons of whole milk. We feed 40 gallons to the calves and give ten gallons of skimmilk to the hogs. We have a dozen heifers on a pasture at our other place which is eight miles from here. The pasture is a large one covering about 200 acres. There is a creek which runs through it and the heifers can get all the water that they want to drink. My heifer is down there with them. There is a man there to call them up every night to see that none is missing.

We have not a calf barn now, but we are going to build one this summer. We have four milkers to do the milking and I carry the milk from the barn to the dairy house, thus saving the milkers from having to do the walking. I feed fourteen calves now and am raising several for the show ring this fall.

I will close this time. Good luck to all the juniors. My address is Ridge Spring, S. C.

Ralph Jordon.

Hoard's Dairyman Juniors:—I thought I would write you a few lines telling you that I hadn't forgotten that I was a junior. I believe the last time I wrote you I had a young calf. She is nearly as big as a cow. I have a registered pig. I have just got through hoeing my cotton the second time. I have six acres of cotton. Papa has 40 acres. I have been reading the junior letters. I read a piece in your paper how to get a new bicycle.

Texas. Garner George.

Hoard's Dairyman Juniors:—I received your letter about four weeks ago but have not had time to write. The weather has been good all last week and we have begun haying. We have all alfalfa hay except a little oat hay for the horses. We are milking 22 cows now, including 7 heifers, and get 700 lbs. of milk per day.

We had to write our diploma examinations on May 18th and I passed and now I have a diploma. I am very proud of it. The average standing was 82. I would like to go to high school at least a year but I live 12 miles from town and they need me at home.

Yesterday and today I have been painting the machine house and the garage, but I am not through yet because I have to paint both twice. Brother was helping me yesterday but not today. I like to paint very well. When we paint or varnish in the house I always do it.

Our truck is working fairly well. I can run it, but not quite as well as father. Last week papa made a trip of 56 miles with the truck and had no trouble whatever and the roads were not of the best kind.

Sunday we had a fine ride in our car from our place to Winslow, Ill. We and two of our neighbors went to see a family who were our neighbors last year. We made a trip of 46 miles.

As I have told you I did not have good luck with my chickens, so I have only one left but it is doing well and is always busy. One of our neighbors gave me nine duck eggs. I set them under a hen and 7 hatched out, but last night a little kitten killed one so I have 6 left.

The cherries are ripe now but we have very few. We can eat nearly all we have.

I think I know a little cure for the grubs which I asked you about last winter. We had one hired man and papa didn't have time to curry and clean the cows as they ought to have been. We had a pure-bred Holstein bull which papa kept clean all winter and he has not had a one of these grubs yet and is exposed to flies as well as cows. What do you think about this method? Excuse my poor writing as it is dark and can hardly see.

Wisconsin. Emma Naef.

Hoard's Dairyman Juniors:—This is my first letter to the juniors. I received my fob, button, and creed and thank you very much for them.

My brother and I bought a pig apiece last year. My brother's pig died. Father said if he would cut the brush out of some corn he would give him a pig. He raised the pig all right. We sold our pigs and bought a colt from father. We also bought a gilt which was to bring pigs in the spring. We sold her and put the money in the bank. This year each one of us bought a pig and paid $5 apiece for them. My brother and I have an acre of corn. We are cutting hay now. I am buying thrift stamps and I think it would be fine for all the juniors to buy thrift stamps to help down the kaiser.

The juniors are giving their addresses so I will give mine. It is Strafford, Star R., Mo.

Wayne Doughty.

Hoard's Dairyman Juniors:—I suppose you have forgotten this junior for I have not written for some months.

We are cultivating corn today. We have about seven acres of corn to cultivate.

When we had so much rain some of the corn drowned out, so we had to transplant some of it. The corn is growing fine now.

The hay around here is not so very good. In some places the hay is short and other places some of it has died out. We expect to begin to hay around the 27th of June because some of the clover has headed out some time ago.

My calf is growing fine now. When you come into the pasture where she is she will run for you. She always wants you to pet her. My father gave my little brother a calf this spring. My brother may join the Hoard's Dairyman Juniors after a while. We joined the Red Cross in our school but it was so late we did not work any on it. Our school has let out. I am glad of it. I can then help my father with the work.

I am going to spend all my money now to buy thrift stamps as it will be safe and I can get it back. I have five dollars that I am going to put in for thrift stamps. My sister has about $50 in thrift stamps. She expects to get a good deal more before 1923. I wish all the juniors good luck.

Wisconsin. Chester Mortenson.

Hoard's Dairyman Juniors:—I received your welcome letter quite a while ago but neglected to answer it.

We are home on our ranch now and it sure seems good to be in the country after staying a winter in town. I have five lambs this spring, four ewes and one ram, which makes me eleven sheep altogether. I was not home in time to get bum lambs so all my increase this year is from my own sheep. Two of my ewes had twin lambs, but one twin got in the creek and drowned.

When I sold my wool last year I received ten dollars and fifty cents for it, which was from three yearling sheep. This year I have the wool off of six sheep to sell and I expect to receive quite a lot more, as wool prices have gone up.

My sister and I sold our pony last fall and bought a colt with the money. We each took a colt, she the young one and I the yearling. She named her Dixie and mine is named Rayzle. We have four young colts this spring and they are sure nice ones. Next year we will have quite a few colts to break for there will be five three-year-olds and five two-year-olds which we may also handle.

Our sweet clover is cut and stacked. Papa is going to use this cutting for hay and the next for seed. The alfalfa is almost all blossomed and we will soon start to mow it.

We have had a fine spring with plenty of rain and sunshine. All our gardens are coming up fine and also all other crops. We have been using lettuce, radishes, and onions since the first of May and we will soon have peas to use.

Well, I must close as my letter is getting rather long. Wishing the juniors luck.

Wyoming. Dorothy J. Grant.

Hoard's Dairyman Juniors:—I have not written for a long time. I have been very busy as we have 180 acres of land and no help.

I went in the pig club and won third prize. Now I have one cow ready to freshen and a two-year-old heifer will soon be fresh. I also have one two-month-old bull calf from our best cow and an 8-month-old Jersey heifer. I bought a fine colt from my father for $25. She is a year old.

Last week one day it was 122 degrees in the shade. I guess that sounds pretty hot and this summer it averaged 110 degrees in the shade.

I am 12 years and 5 months old now and graduated from grammar school.

I can not get very many subscriptions here as there are not very many dairies.

Well, this is all. Wishing the juniors good luck. Address is Holtville, Cal., Star route.

Ralph Bisnett.

Hoard's Dairyman Juniors:—I have been so busy that I could not write you but it is raining today and so I have time to write.

In your last letter you asked what I am feeding my pig. Well, he weighs about 140 pounds now. He is on alfalfa pasture all the time and then we feed him milk slop and corn and he is doing fine. We are going to put him in a pen to fatten this fall.

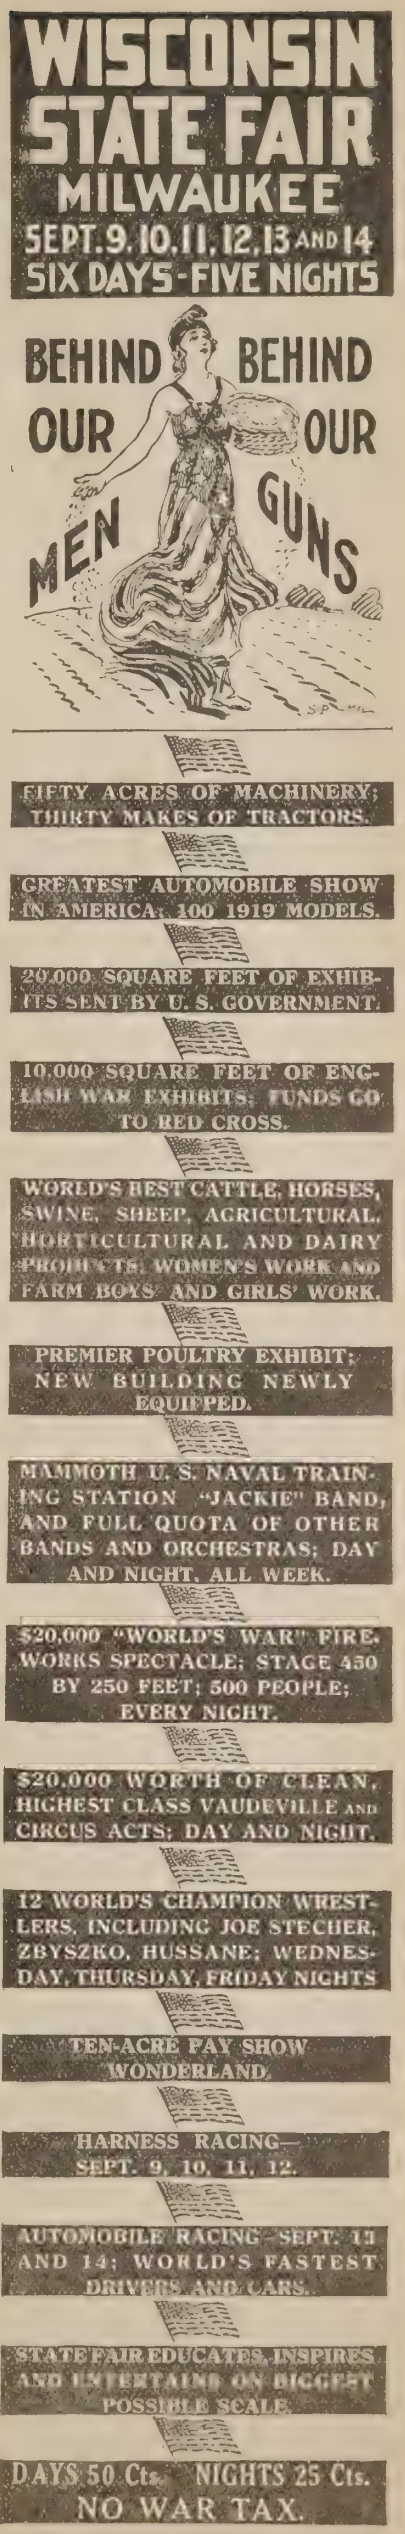
The other day my brother and I bought a little heifer from our father. We are milking seven cows now. We lost one of our best cows last winter. My letter is getting rather long and so I will close. Wishing all juniors good luck.

Kansas. Clifford Hultgren.

Hoard's Dairyman Juniors:—Please excuse me for not writing sooner but I have hardly had time. I received the fob, button, and creed all O. K. I sure do like them.

In your letter you asked me if my Hampshire was a gilt. She is. She has five pigs and they sure are pretty. I am going to keep her.

I told about my Shorthorn heifer; I will tell how I got her. The People's Savings Bank of Thomasville sold them to the Corn and Pig Club boys of Thomas County on a credit. They were to weigh them when we got them and the boys were to keep them till the fair this fall and then carry them back and all the heifer had gained the boy got. I am going to buy mine and raise some more. I have fed her beans, soaked, every night till they gave out and in the day time she goes in the pasture and gets Bermuda grass and Johnson grass and gets plenty of water.



We have four cows fresh now and we are getting plenty of milk and butter and we are going to make some cheese pretty soon.

We have laid by all our corn now. We have 125 acres in corn. I wish we had a silo, I hear so much about them.

I have a patch of potatoes which I am going to sell and invest the money in war saving stamps. Papa has an acre of Caster beans for the government and he also has $200 in liberty bonds. I sincerely hope we can whip the Germans and we all, down here, are doing our part.

I reckon this is enough for this time. I will close. Good-bye to all the juniors.

Georgia. Talmage Elrod.

MOORE, Wallingford, Iowa.

Wanted at Once—A reliable man not in draft, understanding care of and able to develop Berkshire hogs and poultry. Near Pocomoke, Md. Address BOX 187, care Hoard's Dairyman. 4-2

POSITIONS WANTED

Manager, married, desires position. Expert developing land, stock raising, A. R. O. work, salary or shares. BOX 148, care Hoard's Dairyman. 2-3

Position Wanted—Herdsman or dairy manager. American, single, past draft age, wide experience, A. R. O. work, can handle successfully any sized proposition, absolutely competent and reliable. Only a first class proposition considered. Give salary and full particulars. Address BOX 178, care Hoard's Dairyman.

Experienced herdsman wants position. Good references. Experienced in A. R. O. work and feeding economically for production. N. I. NELSON, Elkhorn, Wis.

Married man wishes position as farm and dairy manager. Have held present position 7 years and given best of satisfaction. Can furnish finest of references. BOX 166, care Hoard's Dairyman. 3-4

Wanted Position—Energetic dairy and stock farm manager of experience and ability, age 32 years, small family, desires position Jan. 1st. At present in charge of one of the largest and best equipped dairy farms in state. Best references as to honesty, capability, sobriety, etc. State salary and full particulars in first letter. Address MANAGER, Box 465, Rome, Ga.

I want on 3-year contract a dairy farm proposition, of modern housing and equipment, up to me in all respects, co-operating with owner for economical and efficient maintenance. Experienced in high grade A. R. O. work, buying and selling of stock, calf raising, scientific, practical feeding. Planning and arrangement of buildings and fields, soil improvement and crop rotation. Modern machinery, mechanical milker, fruit, garden, poultry, swine. Care of estate. Exempt. Children. Particular as to schools and churches. References. $1,500 per year, one-half of profits over interest and depreciation. Use of farm products. Address BOX 180, care Hoard's Dairyman.

Wanted—By experienced dairyman over draft age, dairy in the south on salary and shares. Can make small investment. BOX 144, care Hoard's Dairyman. 2-4

Married man desires position on farm as teamster. Experienced with horses. Prefer California. W. H. MAHNKE, General Delivery, Tacoma, Wash.

Wanted—Position. Farm or estate manager. Married. No children. Draft exempt. American. References. Eastern states preferred. BOX 172, care Hoard's Dairyman.

Wanted—Position as farm manager or herdsman by American 26 years old, married, no children. Life experience and college training. Can handle help, all farm and dairy machinery, care of dairy cattle, A. R. O. work, grain crops. References. East preferred. Address BOX 185, care Hoard's Dairyman.

Young man, single, wants a position as herdsman or farm manager or as assistant. Want steady job. Life experience on farm. 4-year Agricultural College graduate. Clean habits. Best references from former employers. Would like to take farm on shares or profit sharing plan. Address BOX 173, care Hoard's Dairyman.

Wanted—Position as working farm manager. Young, single, experienced, good habits. Also young man experienced, willing and good habits, as helper. BOX 174, care Hoard's Dairyman.

Wanted—Position as farm manager or herdsman. Life experience farm and dairy. Age 35, married, two children. State wages first letter. BOX 181, care Hoard's Dairyman.

Married couple with 3-year-old boy desire position on big farm. Man 28, experienced. Wife good buttermaker, willing to cook for help. State wages. WM. PAPE, Buhl, Minn.

Wanted—Position as farm foreman. American, age 28. One child, 4 years. Understand farming and dairying thoroughly. Operate all farm machinery, autos, gas engines and tractors. Do simple repairing of same. Handle any number of men. A hustler and not afraid of work. G. C., 1018 Elice St., Waukesha, Wis.

Position wanted by reliable married couple with one small baby, as cook and helper on large farm. Man to do cooking and woman other housework. Steady all year round position expected. Address BOX 171, care Hoard's Dairyman.

Farm manager, scientific, practical, experienced on large modern farm or estate. Thoroughly understands up-to-date farming, A. R. work, orcharding, pruning, spraying, landscape gardening, etc. Can handle men, teams, and farm machinery to advantage and produce results. Strictly temperate, energetic, reliable. 5 years present position. Excellent references. BOX 179, care Hoard's Dairyman.

Wanted—Position on dairy farm by married American, long experienced and training in dairy work, breeding, feeding, developing and showing Jerseys, Ayrshires and Berkshire hogs. Also large A. R. experience. Best references and reasons for change. For further particulars address BOX 177, care Hoard's Dairyman.

Working farm manager and herdsman wants a position by Oct. 15. Life experience in farming and farm machinery, also steam, kerosene and gas engines. Married, one child. State wages and full particulars in first letter. WALTER SCHMIDT, JR., Wrenshall, Minn.

Burr Oak Jersey Farm Picnic

The meeting of the Jersey Breeders' Association of New Jersey at W. C. Spann's Burr Oak Jersey Farm July 31 was made the occasion for the first Jersey breeders' picnic at Mr. Spann's new home.

President M. D. Munn of the American Jersey Cattle Club urged breeders of New Jersey to band themselves more closely together for the improvement and advancement of the Jersey breed. Geo. W. Sisson, Jr., gave a very interesting historical sketch of the part that New Jersey once played in Jersey affairs. He reminded his hearers that some of the greatest cows of the breed were at one time owned in New Jersey, and that the state has always been prominently represented in the breed and in the Club by men who maintained the highest ideals in dairy cattle development. I. Robert Blackburn of Ohio gave an instructive address on "Breeding for Production" and outlined a mathematical formula of breeding operations which have brought him to the front ranks of Jersey breeders within a comparatively few years. Mr. Blackburn does not advocate the breeding of cattle for production alone, and he believes that type should not be lost sight of as one factor is closely dependent on the other for complete success in breeding operations. He referred to the breeding of cattle for type as an art and the breeding of cattle for production as a science, and he gave his views on combining art and science in producing a beautiful and useful dairy cow. Mr. Spann led out some notable animals now at his farm, one of which is Peerless Jolly Fern, a promising three-year-old bull.

The regular business meeting of the Jersey Breeders' Association of New Jersey was held at which arrangements were made for a vigorous campaign to further popularize the breed in New Jersey. Action was also taken in regard to a good showing of Jerseys at the Trenton Fair this year. Membership fees were revised, and the campaign for new members will soon be under way. The present officers of the club are: W. R. Spann, president; C. R. Hires, vice-president; Fred Huyler, secretary.

Mr. W. R. Spann announced his sailing to the Island of Jersey, and was wished *bon* voyage by everyone present. He has experienced some difficulty in arranging for the shipment of fifty-four animals, and is going over there personally to arrange for their immediate consignment.—AMERICAN JERSEY CATTLE CLUB.

Hay Caps' Value Shown

At the New Jersey Experiment Station it was found that when some cocks of alfalfa were covered with cotton sheeting caps 45 inches square and exposed to a heavy rain lasting 24 hours, the hay was damp only 2 or 3 inches below the top. The cocks that were not covered received a thorough wetting, and the hay was more or less bleached, the stems brittle, and the loss of leaves heavy.

Hay caps are especially valuable in curing alfalfa and clover hay, which do not dry out as readily as the grasses. Alfalfa hay must be handled carefully to avoid loss of leaves, which constitute from 40 to 60 per cent of its weight, according to the bulletin. Farmers making a specialty of producing choice hay for market, or feeders, such as dairymen, desiring good palatable hay free from dust will find that under certain conditions it will pay well to cure hay in cocks, under hay caps, when ordinary methods have been found to be unsatisfactory.—U. S. Weekly News Letter.

Vessels sailing from New York in June were cut more than 25 per cent in their sugar requisitions, to conform to the Food Administration ration.

CUT OFF MORE CORN THIS YEAR

The best agricultural authorities have proved that 30% of the feeding value of the corn crop is in the stalk, yet thousands of acres of corn stalks are practically wasted annually by field feeding.

Get the big profit from your crop. Cut off more corn this year. Do this with no more help and in much less time. Use the

JOHN DEERE CORN BINDER

The Binder with the Power Carrier and Quick Turn Tongue Truck

In addition to the labor and time-saving features of the John Deere Corn Binder, its better, more lasting construction and its many operating advantages will have a particular appeal to you.

Power carrier relieves you of all the hard work—simply press the foot trip lever and the carrier, which is always in receiving position, dumps the bundles in windrows free of the horses' path, parallel to the standing corn.

The Quick Turn Tongue Truck, another valuable feature, relieves the horses of all neck-weight and makes turning at the ends as easy as when the horses are hitched to a wagon. The truck, with a flexible mounted axle, conforms to uneven ground perfectly, keeps the gatherers to their work, prevents sluing on side hills and does away with side draft.

There are many other features of merit, such as bigger and stronger wheels, heavier main frame, flexible throat springs, three packers instead of two, four discharge arms and roller bearings, which all combined make an unusual light draft, serviceable and dependable binder.

Like other John Deere Implements, the John Deere Corn Binder is built on the standard of quality that insures service and satisfaction. Place your order early with your John Deere dealer for a John Deere Corn Binder. Be assured of delivery when you need it.

For Better Grain Crops

DRILL planting saves seed, gives the crop a better start, increases yields, and produces grain of better quality than any other known method of planting. These are the years when every acre of small grain must produce every possible bushel and these are the drills to plant with.

If you are growing small grain, and are not using an **Empire Jr., Hoosier,** or **Kentucky** drill for planting, you are losing money and the world is losing grain. Buy the right drill from your local dealer who has in stock, or can get for you, the drill best suited to your soil and crops.

The dealer will show you all about feeds, furrow openers, bearings, attachments, the regulation of quantities, and all the other things you will want to know. Talk this over with him or write to us, and we will send you complete information about the **Empire Jr., Hoosier,** or **Kentucky** drill that is best for you to buy.

Dairy Cattle Breeders

The National Dairy Show, to be held at Columbus, October 10th to 19th, is to be filled this year with more real value for the industry than any of its predecessors, and that is "a large order," but these are "large times" when every citizen is expected to contribute to the sacred cause our country is at war for, in some useful way.

The government is to use the Show this year to put over some potential messages to those engaged in the industry and to the peoples of the world, as to just what the dairy cow means in the matter of feeding the human family. In order that the work of the government shall attain the highest degree of efficiency, the dairy industry must support the officials in every detail. The men who will have charge of the work are keenly anxious that there shall be imposing exhibits of dairy cattle and dairy products.

The milk, butter, cheese, and ice cream people are planning for an outstanding display of these products.

A Welcome Defense Against the Rigors of Winter and an Insurance of Profitable Feeding.

Now, the cattle men should give evidence of their ability to rise above the exigencies of the war, and "go on" with the work of necessity at home while our boys are taking care of the job over there.

Nothing counts in this war unless each one feels he or she is personally in it and unless we show a willingness to understand the word sacrifice. Canada, with four long, weary years of blood and treasure, is promising more cattle exhibits than ever brought to the National. Surely nothing can obtain in the nature of a so-called obstacle that will cause our breeders even to hesitate in taking hold and making this Show what it should be, an "inspiration."—Publicity Department.

There are instances where it will not pay to construct a silo when there is an abundance of alfalfa hay, but as a rule the silo is a very good institution where alfalfa hay is plentiful. There is nothing that will supplement alfalfa better than corn silage. There is something about the combination of these two feeds that seems to meet the requirements of the dairy cow. Furthermore, cows do better when fed some succulent feed. If alfalfa is to be used for silage it is customary to use the first crop. The crop is ready to cut when the growth of new shoots appear on the crown. When the shoots begin to show, the alfalfa as a rule is just going into bloom.

Sugar bowls have been banished from American dining cars—a traveler is served his portion of sugar and no more.

How Fresh Water-on-Tap Saves Labor

INSTEAD of pumping to water the stock, just turn a faucet and get a steady flow of *fresh* water—not storage water.

Instead of pumping and carrying water to the barn on cold days, have *fresh* water on tap—always at the same even well temperature.

For spraying and for all household uses, there are a hundred ways in which you *save labor* when you have a

NATIONAL
Fresh Water System

Water comes *straight from the well*—not from a storage tank. Delivered in a steady flow by compressed air, safest of all power, operating powerful air-driven pump in well itself. Absolutely dependable.

How Many Tires Does *Your* Car Need To Go 10,000 Miles?

The above question is of direct interest to you. It makes no difference whether you are concerned about motoring economy for personal reasons, or simply as a principle of national conservation.

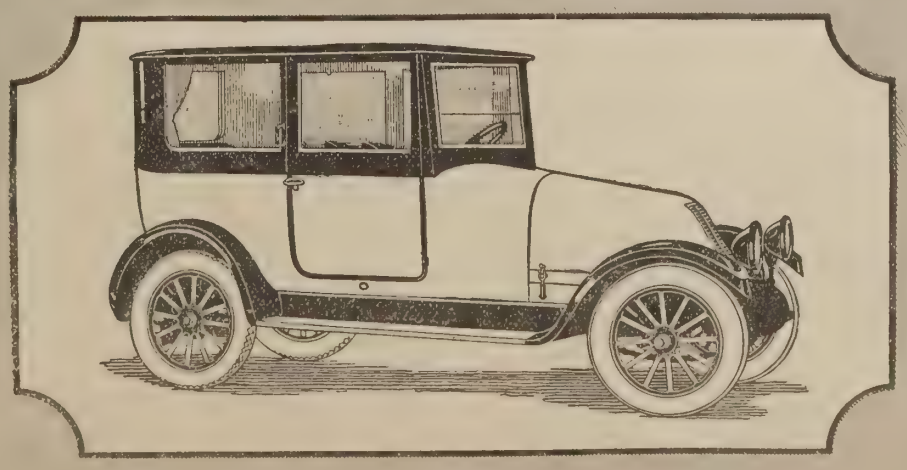
The average car (on the right) either heavy, or rigidly-built, or both—to go 10,000 miles, needs an extra set of tires, or eight tires in all.

The Franklin Car (on the left) to go the same distance—and further—needs only the four tires on the car, or half as many as the other.

There could be no clearer illustration of the timely economy of the Franklin Car; nor a more direct indictment of *unnecessary* motor car weight.

For it is excess weight that prevents the average heavy and rigid car from equaling the publicly-known Franklin tire-mileage. The action of the weight of an automobile on the tires is similar to a hammer blow—and the heavier the hammer, the harder and more destructive the blow. Heavy weight pounds out tires prematurely. And the heavy car owner, accustomed to paying for tire-mileage he doesn't get, accepts this as a matter of course—until he meets a Franklin owner.

For Franklin owners get a consistent delivery of 10,000 miles or more to the set of tires.



The reason lies in Scientific Light Weight and Flexible Construction. The Franklin weighs 2445 pounds—the right weight for a full-size five-passenger car. It also carries the minimum *unsprung* weight—weight *below* the springs, that contributes to the pound and shock tires must meet.

Franklin Flexible Construction—full elliptic springs, instead of the usual compromise type; chassis frame of tough, resilient ash instead of unyielding steel—is still another reason why tires on the Franklin get every opportunity to deliver the full mileage that is in them. This flexible construction reduces road shocks on the tires. There are no torque bars or strut rods to cause the rigidity that leaves tires unprotected.

These are facts of Franklin Construction that affect the whole performance of the car. Because of Scientific Light Weight, because of Flexible Construction, the Franklin is not only economical in tires, but it also gives a day-by-day delivery to its owners of 20 miles to the gallon of gasoline—instead of 10.

Think of these things—and decide whether any car that combines fineness with motoring economy such as this, is not worth your immediate inspection; especially in these days when waste in motoring is not going to be considered any more legitimate than waste in anything else.

FRANKLIN AUTOMOBILE COMPANY, SYRACUSE, N. Y.

The Work of Two Cars At the Cost of One Ford

The Heath DUPLEX makes a Ford touring car do the work of both a passenger car and a truck.

It actually turns dead expense into paying investment.

The Heath DUPLEX is a patented folding truck body.

It attaches permanently to your Ford touring car, ready, *in a minute's time,* to be made into a truck or passenger car.

It takes advantage of the wonderfully low-cost operation of the Ford and applies it to a practical, money-making purpose.

It adds hundreds of pounds of carrying capacity to the Ford at an exceedingly small initial expense.

On the average farm it will literally pay for itself in a month's time.

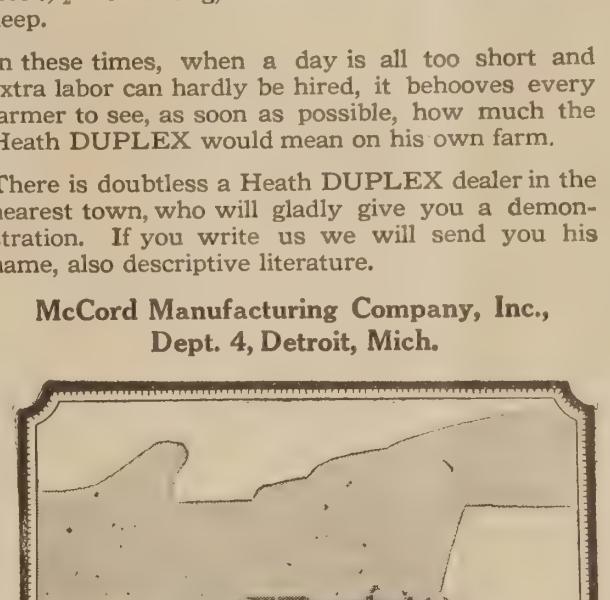
All this without interfering in any way with the Ford's usefulness or altering its appearance as a passenger car.

With the Heath DUPLEX you have a strong, serviceable truck to haul produce, machinery and supplies anywhere.

In 60 seconds, and without tools, you turn the Ford back into a passenger car again.

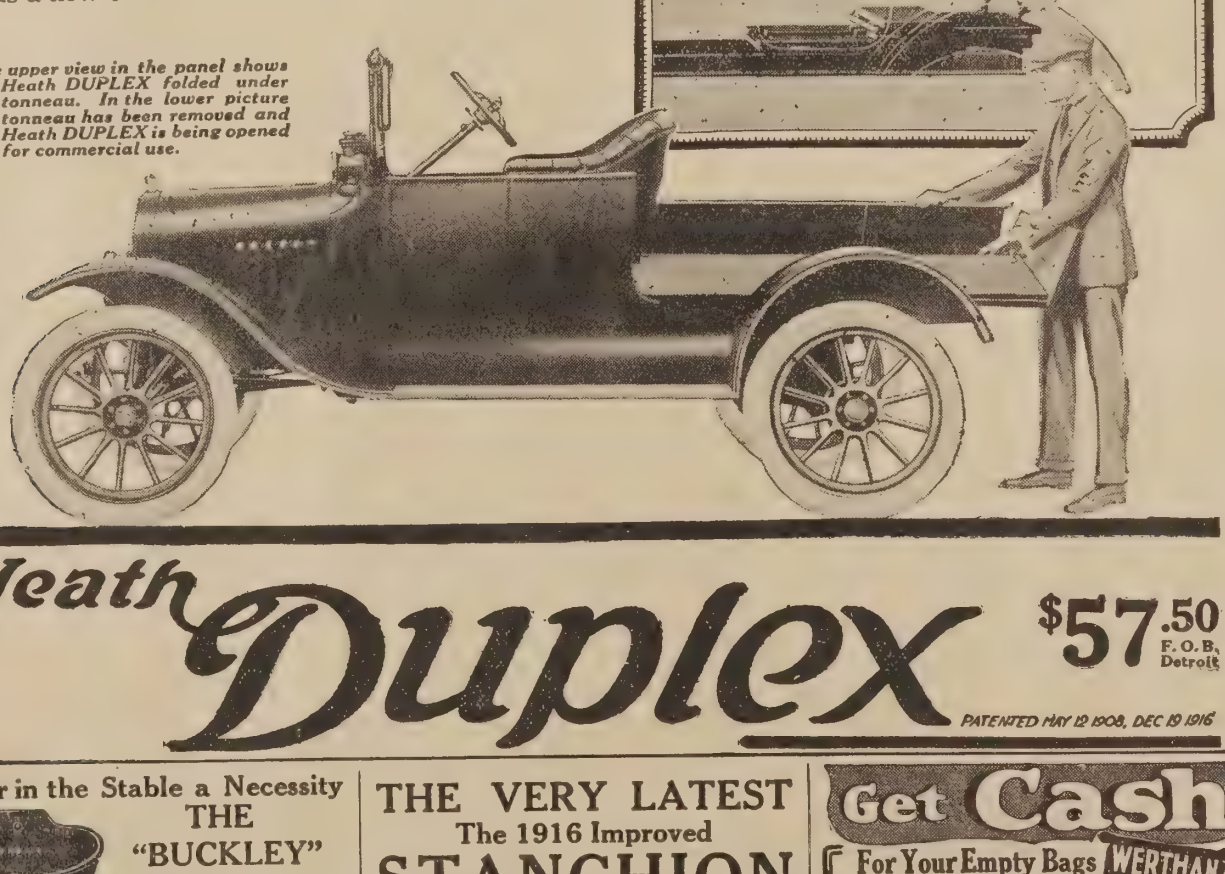
The Heath DUPLEX attaches to an old Ford as well as a new one.

In the original installation (made by any man handy with tools) the tonneau is made removable. Nothing else is disturbed.



The Heath DUPLEX is never removed. It simply folds under the tonneau when you want a passenger car, and opens out—after the tonneau is lifted off—for trucking purposes.

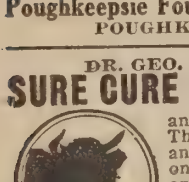
The folding delivery body has a carrying space 4 feet 4½ inches long, 32 inches wide and 10 inches deep.



In these times, when a day is all too short and extra labor can hardly be hired, it behooves every farmer to see, as soon as possible, how much the Heath DUPLEX would mean on his own farm.

There is doubtless a Heath DUPLEX dealer in the nearest town, who will gladly give you a demonstration. If you write us we will send you his name, also descriptive literature.

McCord Manufacturing Company, Inc., Dept. 4, Detroit, Mich.



The upper view in the panel shows the Heath DUPLEX folded under the tonneau. In the lower picture the tonneau has been removed and the Heath DUPLEX is being opened out for commercial use.

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Cows Fail to Come in Heat

I wish advice in regard to what to do with five of my best cows that freshened in March and April. I have not been able to get them bred since, in fact they have not shown any signs of coming in heat since. I tried leaving the herd bull with them night and morning for ten days and got no results. Is there any possible way I can get those cows bred?

I have a herd bull, 4 years old. He was always gentle until lately but is now getting ugly and it is dangerous to try handling him at all, unless by great care and force. I would like to keep this bull two seasons yet if I can. How would you advise handling him? Being gentle with him doesn't seem to work any more. His dam made 29.13 lbs. butterfat in 7 days. Her average test was 5.53 per cent. Which would be safest, to use this bull on his own daughters or use one of his sons that was from a pure-bred cow? The young bull I have would be a brother to those yearling grade heifers. Please advise, as I am compelled to do either one. Which method would I get the best results from?

Dushore, Pa. P. J. G.

There is nothing gained in breeding a cow which does not come in heat. We can not understand what causes the condition described unless these cows are under-nourished. It should be made certain that they are fed liberally so that they are maintained in good condition, that they have a liberal salt supply, and that such feeds as legumes make up a fairly large proportion of the ration. These cows should be examined to make sure that they are in good health. An animal badly diseased with tuberculosis might evidence the condition described. Other diseases might also bring this about. Examination by a qualified veterinarian would likely discover the difficulty.

The safest practice with a herd sire is to care for him under the continued supposition that he is dangerous. Never take a chance with a bull. Do not abuse such an animal and do not waste time in petting him. Keep him in an enclosure so that he is fed and cared for and used in service with absolutely no opportunity to injure an attendant. Never lead him without the use of a staff. We have had too much experience with bulls and have had too many friends injured by "gentle bulls" to follow any practice but this one.

Therefore, in this case we would by all means retain the four-year-old bull in service and breed him back to the heifers rather than to use his son which is half brother to the heifers. We gather that the older bull is from a dam with a larger production than the dam of the young animal. This is our reason for maintaining him in the herd.

No Abortion—Impotent Sire

I would like your advice on my herd of Jerseys. They all fail to get with calf although I have bred them every 21 days. This spring they had strong, hearty calves that were carried full time and lived and are all right.

My cows are receiving good care, are in good flesh, and appear to be in the pink of health. Do you think it is abortion? I have never had a cow to lose her calf and have never had abortion that I know of, and they have never shown any sign of abortion.

Iowa. R. L.

We are especially glad to give assurance that we can see no reason to suspect that there is abortion in this herd. The fact that the cows have dropped strong, hearty calves which were carried full time and that the herd has been maintained in good flesh and good health, indicates strongly that the animals are not diseased. It seems almost certain that the difficulty lies with the bull which is being used.

We recommend, therefore, that a different sire be secured immediately as in all likelihood the difficulty lies in the impotency of the present herd bull.

"You Wouldn't Think the Engine was Running"

More than one motorist whose engine is fitted with *Lynite* Pistons has had this experience.

For one of the most noticeable things about the *Lynite*-equipped engine is the almost total absence of vibration.

Put your hand on the hood while the engine is idling, and you'll be struck at once by its smooth, quiet running.

By cutting two-thirds from piston-weight, *Lvnite* Pistons have practically overcome one of the most annoying and destructive features of motor-car operation.

How *Lynite* Pistons Cut Down Vibration

Faster, faster, faster the pistons travel up and down in the cylinders, thousands of times a minute. At the end of each stroke, they have to be abruptly stopped in their swift flight and sent traveling in the opposite direction.

With heavy cast-iron pistons, every stop means a mighty jerk and a shock that travels to all parts of the engine.

Multiply these jerks and shocks by two or three thousand every minute — the number of trips the pistons make — and you can quickly see that the engine fitted with heavy cast-iron pistons cannot help but constantly quiver and tremble.

But cut two-thirds from the weight of the pistons by using *Lynite* and the shock at the end of each stroke is so greatly reduced that, in the well-designed engine, it is scarcely noticeable.

How Reducing Vibration Benefits Your Motor Car

Vibration is a constant menace to satisfactory engine operation. It throws some parts out of alignment and jolts others loose. This, in turn, causes wear on other parts and, before long, the entire engine is affected. Moreover, vibration interferes with the comfort and pleasure of driving.

Every bit of it that's gotten rid of, therefore, means less wear and tear, longer car-life, lower cost of upkeep, fewer stops for repairs and greater freedom from annoying rattling and shaking.

Lynite Pistons also increase acceleration and flexibility, practically eliminate carbon troubles and effect other notable improvements.

You'll find *Lynite* Pistons in the engines of a large number of motor-cars, the moderately-priced as well as the higher-priced. See that they're in your next car.

Satisfaction Assured In Advance

It is a fact that Lalley-Light usually finds preference among those thoughtful farmers who are regarded as neighborhood leaders.

It is not hard to understand why. The man who seriously looks into the electric light situation discovers that Lalley-Light has been in successful farm use for more than seven years.

He hears it well spoken of everywhere it is known.

He learns that faithful, year-to-year service and economy are the experience of Lalley-Light users.

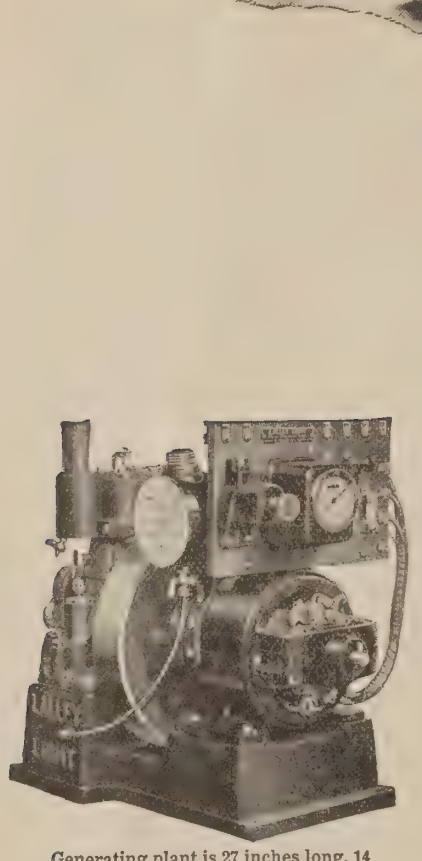
He receives the impression that he would be entirely safe in investing in Lalley-Light.

He accepts these things as actual advance assurance of his own future satisfaction.

In reality, they are exactly that. For Lalley-Light satisfaction probably approaches 100 per cent as closely as it can be approached.

Never was the need for Lalley-Light so imperative as now.

Farm labor is scarce. Lalley-Light saves labor by supplying the power to do much necessary work.



Farm products and farm buildings are more valuable. Lalley-Light safeguards them by removing the fire risk entirely.

Lalley-Light brings to the farm a score of conveniences and comforts that only electricity from a wholly dependable plant can bring.

In addition, it has its own exclusive advantages which the nearest Lalley-Light dealer will gladly demonstrate and explain.

Write us for his name, and for complete details.

Look for the Lalley-Light demonstrating exhibit at your state or county fair this fall.

Generating plant is 27 inches long, 14 inches wide, 21 inches high. Storage battery is included in complete outfit.

Sure Death to Hog Worms.

At last there is a hog worm remedy that is absolutely positive.

Bonnett's "Big B" Worm Capsules

are now used by Agricultural Schools, Farm Advisers, Veterinaries and leading hog raisers. Absolutely sure and quick in its action. Each hog gets just the proper dose to expel the worms and put it in fine condition to make the most weight out of every pound of feed. Breeder's Gazette recently had an article on its great popularity. Nothing else like it. One capsule does the work. Satisfaction guaranteed. "Big B" Worm Capsules $5 per 100. Pig Gun and Speculum $7.50. All charges prepaid. Order today.

J. L. BONNETT MFG. CHEMIST,
Dept. 23, Bloomington, Ill.

Stover Silage

In response to our request for information concerning stover silage, Professor H. P. Rusk of the Illinois College of Agriculture writes as follows:

"After preliminary tests, the Illinois Experiment Station put up four silos of stover silage. All of the corn that could be removed by the husking machine was taken out. The fodder stood in the shock until the latter part of December, when three silos were filled. Water was piped up the outside of the silos and delivered to the top of the distributor and added in the following proportions:

"1st silo—8 pounds of water to 12 pounds of stover.

"2nd silo—10 pounds of water to 12 pounds of stover.

"3rd silo—12 pounds of water to 12 pounds of stover.

"About the middle of February a fourth silo was filled with equal parts, by weight, of water and dry stover, and one-half of one per cent blackstrap molasses.

"Forty head of breeding cows were used in an experiment to determine the relative value of these silages and normal corn silage in winter maintenance rations.

"A detailed discussion of the results would require too much space to include here. A few of the most important observations, as I see them are that this silage made a palatable feed, and when fed *ad libitum* with 1 pound of linseed oil meal per head daily, more than maintained the weight of the experimental cows until they calved. All lots lost some weight, due to the fact that the experiment carried them through the calving period. The largest loss, 88 pounds per head, occurred in the lot receiving our standard winter maintenance ration of 40 pounds of normal corn silage and 1 pound of linseed oil meal per head daily. The normal silage came from the same field that produced the stover put in the first three silos. It contained 7.35 bushels of corn per ton and cost $10.92 per ton as fed. On the basis of this value and 3c per pound for linseed oil meal our standard winter maintenance ration cost us 24.8c per cow per day. On the basis of $1.50 per ton for the stover silage and 3c per pound for linseed oil meal, the feed cost in the stover silage lots ranged from 7.2c to a little over 8c per head daily, or approximately one-third of the cost of maintenance with normal corn silage. We hope to have the complete data published in bulletin form some time in the near future."

Professor Grout, formerly of Minnesota College of Agriculture, figures out the increased value and efficiency of the silo as follows: "The silo practically increases the producing capacity of the farm at least 10 per cent, and often more. A 160-acre farm with a silo will produce as much revenue as one of 180 acres without. Therefore the first cost of a silo—like that of a dwelling house, a barn or a team—should be considered part of the initial investment; and if one's capital is limited, it is better to buy a farm smaller by 10 per cent, rather than dispense with a silo. The producing value of a silo on $50 land would be equal to that of 20 acres added to the 160-acre farm, or $1,000; on $100 land it would be $2,000. This is a low estimate, for the stock-carrying capacity of the farm will often be increased fully 25 per cent by the adding of a silo. As compared with its producing value, the cost of constructing a silo is small."

"Right and liberty have obliterated space and the ocean to bring France and America together."—President Poincare.

Bone Meal Increases Wheat Yield

Bone meal has been shown by experiments conducted by the Missouri Experiment Station to be an excellent fertilizer for wheat on the average Missouri soil. Unfortunately the demand at this time is greater than the supply, and farmers who have been using it in former years will doubtless have to use another fertilizer this fall. The increase in the price of bone meal, however, from about $30 to $50 per ton, has made it no less valuable as a fertilizer for wheat, since with the increased value of wheat the net returns are considerably greater than at former prices. Where farmers can secure bone meal, particularly the steamed bone meal, it will prove one of the most valuable fertilizers.

"Acid phosphate and highly phosphatic mixed fertilizers are destined to take the place of bone meal in Missouri," says M. F. Miller of the University of Missouri College of Agriculture. "Acid phosphate gives about the same return in wheat the first year as does bone meal, but it seems probable, from experiments conducted by the Station and the experiences of farmers, that it will not show quite the same return on the crops which follow. On the other hand, acid phosphate is considerably cheaper than bone, and sells at this time from $27 to $30 per ton, depending upon the grade. It can, therefore, be used with a similar expectancy of profit.

"Phosphatic mixed fertilizers on soils low in nitrogen and potash will often bring better returns than the straight phosphates, particularly at normal prices. The wise farmer, however, will endeavor to put nitrogen in the soil through the growing of legumes and the use of manure, and will limit his fertilizer applications very largely to phosphates or, at normal prices, to phosphates with some potash."

An average dairy cow will eat 35 lbs. of silage per day, or 10,500 lbs. in 10 months; 40 cows will eat 420,000 lbs., or 210 tons. For this amount of silage it would be better to build two 120-ton silos rather than one 220-ton silo. A silo 16 feet in diameter and 30 feet deep will hold 120 tons. If preferred, a silo 18 feet in diameter by 45 feet high may be built, and it will hold about 220 tons of silage.

JERSEYS

MERIDALE JERSEYS

For Sale:—Five sons of Interested Prince 2d 95708. Out of Register of Merit dams. They are the kind that spell herd improvement.

AYER & McKINNEY

A few for sale.
H. C. YOUNG, 33 and O Sts., Lincoln, Neb.

ENTIRE HERD
60 Registered Jersey Cows and Calves 60
For Private Sale

Having recently been elected Secretary and Treasurer of the White Eagle Dairy Company, I will not have the time to give the close attention to breeding and the production of milk which I have in the past and am offering the public a rare opportunity to buy some choice foundation stock, both cows and calves. I have been engaged in the breeding of Jerseys for nearly ten years, and have never had a public sale and will depend largely on my many satisfied customers to buy this stock and will give them the same fair treatment which has characterized my business from the start.

Write me for list of the stock, the milk and fat records, the breeding and prices. This will be your best opportunity this year to select some choice foundation stock, rich in the blood of Noble Oaklands and Oonan of Riverside.

Unprofitable cows have always been culled from my herd. Nothing but good paying cows in this offering.

Five tests of my herd and never a case of tuberculosis.

D. V. VANDIVER, Columbia, Mo.

OWL-INTEREST
Our calf No. C 2, dropped Dec. 25, 1917, is the result of 31 years of careful breeding and selection. He has 25% blood of Interested Prince, 58224, sire of Passport, the champion Jersey milker, 19,694 lbs. milk, 839 lbs. fat, and grandsire of Interested Jap's Santa, 13,308 lbs. milk, 805 lbs. fat, and The Owl's Princess May, 12,213 lbs. milk, 744 lbs. fat.
His sire:—Sibley's Interested Prince, has 6 daughters in the R. of M., one that has made over 70 lbs. fat in 1 month as a 3-year-old.
His dam:—Owl's Tones is entered in the R. of M. with 9,839 lbs. milk, 465 lbs. fat. Now on retest has given in 6 mos., 7,042 lbs. milk, 327 lbs. fat. For pedigree and price address
MOOSE HILL FARMS, SPENCER, MASSACHUSETTS.

SWINE

Cedar Crest Farm Berkshire

Cholera Immune

The wonderful bargains we offered in Berkshi were so quickly taken advantage of that we have no single boar of serviceable age for sale and only a f brood sows, weighing 250 to 300 lbs. bred for their fi or second litter and a limited number of unbred gilts. Our stock is right and our price is right. Wr us today for complete information. Remember—fi come first served—the quicker your order is placed better the selection to choose from.
CEDAR CREST FARM, J. K. Dering, Prop., Lake Villa,

Breeding Powers Injured

I have a Holstein bull eighteen months old at seems to be sterile. Last winter he ran th the young steers and was fed silage with em. He was 14 months old when he served s first cow late this spring and since that ne has served five others. Without exception failed to get any of them with calf. After ying him with each cow twice I bred them another bull and in no case has it been nec- sary to repeat. Will you please advise if u think I have permanently injured him by eding silage or will he get over it? If he has reasonably good chance to yet make a eeder will hold on to him as he is a good, animal and has a good milk record behind m.

Mt. Ayr, Ind. A. J. H.

Feeding any service bull a heavy ipply of silage, particularly when ie animal is under-nourished and oes not receive other nutritious feeds hich would be included in the ration, most certainly injures breeding owers. Whether such an animal is rmanently sterile depends largely on the degree of the under-nourish- ent and the over-feeding of a heavy, ilky feed, such as silage.

Bulls with good milk records be- nd them are of particularly high lue at this time when there is spe- al need for improved dairy herds. is advisable, therefore, that such animal as described should be kept r some time in the hopes that he ill later be of value as a breeding imal rather than that he should be aughtered at this time. This bull ould be kept away from the herd id given plenty of exercise and a eral ration. Such roughages as si- ge should not be fed but a nutri- us legume hay in limited quantities d a grain mixture liberal enough at the bull is maintained in good ndition, should be fed.

With this treatment there is a good ance that this animal will later be value as a herd sire.

Almost 70 per cent of all the sugar nsumed in this country is used in e households. So it is up to the men to make the sugar go around.

HOLSTEINS

Springdale Farms Grade Holsteins

Our herd consists of nearly five hundred head and they are all FOR SALE. We are prepared to furnish carload lots of fresh cows, springers or cows due to freshen this fall, also two and three-year-old heifers. If you want large, heavy producing cows it will pay you to see our stock. You will find our prices right. F. P. SAUNDERS & SON, Cortland, New York. Office 50 Clinton Ave. Telephone 116 or 1476M.

A Rare Chance

To secure a few choice

Grade Holstein Cows

Just fresh and due within a few weeks. These cows were selected to furnish milk for a famous summer hotel which is soon to be turned into a Government Hospital. They are a very fine lot and will be sold in numbers to suit the buyer. There are only a few of this kind in New York State. Wire your arrival. Don't wait to correspond.
River Meadow Farms, Portlandville, N. Y.

Soon Ready for Service

Young Holstein bulls from good Official Record dams and sired by SPRING FARM KING PONTIAC 6TH. Fourteen of his first sixteen two-year-old daughters last winter each made better than 20 lbs. of butter in seven days; a showing never before equaled by the first two-year-old daughters of any other sire. These young bulls are nice straight, thrifty, desirable animals. We would be glad to write you full particulars. You will be surprised that our prices are so low for so much quality.
Henry Stevens and Son, - Lacona, N. Y.

LAKESIDE HERD

For forty years this herd has taken the lead in breeding for the highest individuality, largest average production, 4% butterfat, greatest uniformity and prepotency, with the result that over four-fifths of all the cows which have made A. R. O. records of 30 lbs. or more, trace their pedigrees to the Lakeside Herd.
Breed this kind and get same results.
E. A. POWELL, SYRACUSE, NEW YORK.

5 Holstein Bulls

Ready for Business At ½ Real Value

They are from world record sire and A. R. O. dams. We are selling farm.
LONG BEACH FARM, AUGUSTA, MICH.

IROQUOIS FARM

AYRSHIRES

High production animals of the best milking and prize winning strains of Scotland, Canada and the United States. A few bull Calves for sale.
F. A. CLARK, Proprietor. - WALDO C. JOHNSTON, Agent.
Cooperstown, New York.

Beaumont Farm, Mt. Savage, Maryland

Our herd sire is KING COLANTHA RAG APPLE, son of Rag Apple Korndyke 8th. His dam is a 30.51 lbs. at three years; granddaughter of Colantha Johanna Lad. *Could you imagine a finer combination?* We consider him one of the best bulls Mr. Cabana ever sold. In build and conformation he is the admiration of everyone who sees him.
We have a son of his, born April 18, 1918, a beauty in every respect; beautifully marked, more white than black; straight in every way. He is out of Van Briseis Pontiac Asiatic 32.60 lbs., a granddaughter of King of the Pontiacs.
This bull will be sold at a reasonable price, and will be worth $2,000.00 when he is ten or twelve months old.

The Only First Prize Winner at the National Dairy Show Having a First Prize Dam and Sire

Sir Korndyke Fytje

We Offer One of His A. R. O. Daughters For Sale

SIR KORNDYKE FYTJE is the best show bred bull in the world—a positive guarantee of type in his offspring.

BOTH HIS DAM AND SIRE won first at the National Dairy Show besides being first prize winners at several state fairs.

THE DAM OF SIR KORNDYKE Fytje made 23.15 lbs. butter at 24 months of age and in a year made 783 lbs. from 18,431 lbs. milk. This was six years ago.

SHE IS A DAUGHTER OF Sir Pietertje Ormsby Mercedes, the greatest yearly record sire in the world, and from

MINNESOTA'S FIRST 1000-lb. cow, Riverview Fytje DeKol Ormsby.

THE YOUNG DAUGHTER of Sir Korndyke Fytje that we are offering made 16.66 lbs. butter in 7 days at 24 months of age.

SHE WILL FRESHEN early in November to the service of King Piebe Ormsby Mercedes, a young bull whose dam made 35 lbs. in 7 days and 1,136 lbs. in a year at 4 years.

HIS THREE NEAREST DAMS average 32 lbs. butter in 7 days and 1,040 lbs. in a year at an average age of 4 years.

SHE IS A SPLENDID heifer for type and size and will make someone a great foundation cow.

THE DAM OF THIS HEIFER made 26 lbs. in 7 days as a junior four-year-old and has a full sister with 26 lbs.

SHE IS SIRED BY Changeling Butter Boy 7th and from a 24-lb. daughter of Queen Piebe of Fairview, one of our greatest foundation cows.

QUEEN PIEBE OF FAIRVIEW made 22 lbs. in 7 days several years ago.

AMONG HER GREAT DAUGHTERS is Queen Piebe Mercedes, 1,389 lbs. butter and 30,230 lbs. milk in a year as a junior four.

THESE ARE BOTH WORLD'S records for her age and no cow, regardless of age or breed, can equal both her milk and butter production.

IF YOU ARE IN THE MARKET for females you want the blood that has produced winners. The pedigree of this heifer contains some of the greatest producing dams and sires in the world.

$750.00 BUYS HER—GUARANTEED SOUND.

Sir Lincoln Karen Ormsby

Born Jan. 1, 1918, he is an exceptional good individual and nicely marked; his sire Sir Pietertje Ormsby Mercedes 22nd has nine 30-lb. sisters, one over 40 lbs. butter in seven days, he is sired by the famous Sir Pietertje Ormsby Mercedes and from Minnesota's first 1000-lb. cow. The dam, Johnson Lincoln Karen 28 lbs. butter in 7 days and 110 lbs. in 30 days is the dam of Ruby Karen Mercedes, 20 lbs. butter, 416 lbs. milk at 2 yrs., 12 days and again at 2 yrs., 11 mos., 10 daysmade 29.68 lbs. of butter. The latter is a ¾ sister to Sir Lincoln Karen Ormsby. For information and price, write

O. J. GROVER, - - - GLYNDON, MINN.

GRANDSONS OF KING SEGIS

Grahamholm Farm has a choice lot all ages up to 10 months. Sired by Sir Winana Beets Segis. He has a 35-lb. daughter, a 30-lb. daughter, and a good number of other great producers.

We also have sons of Dutchland Creamelle Colantha Lad, one of the best bred bulls for yearly production.

Every cow in the herd has an A. R. O. butter record. Come or state your wants. Address

W. J. BOYNTON, Mgr., Rochester, Minn.

A Few Holstein Bull Calves

From a sire whose dam was a former state champion yearly cow—

For Sale

R. B. GOODHUE, - DENNISON, MINN.

Buy Them Young

Buy your herd sire young and save money. You can raise it as cheaply as we can.

We are offering for sale some excellent young sons of Buffalo Skylark Ames, a champion at two National Dairy Shows with a fine list of A. R. O. daughters, and out of A. R. O. dams. Write for full information.

E. H. Kuchenbecker, R. 1, Owatonna, Minn.

A Beautifully Marked Baby Bull of Ormsby Breeding and Quality

from an A. R. O. dam. He's a choice youngster that you'll be interested in.—Yours for $150.00. Write for full information concerning him. Remember our herd is and has always been absolutely clean. **Poplar Hollow Stock Farm, P. O. Station F. - Minneapolis, Minn.**

Mankato Holstein Herd

Offers you this

WONDERFUL BARGAIN

BULL born February 9th, 1918. ¾ white. Large and straight—a beautiful show calf, from a 32-lb. sire and 20-lb. dam. 5 nearest dams average 25 lbs. butter in 7 days. Price $350. **Marlow and McCargar, Mankato, Minn.**

Never mind the 7-day records, it is

The Other 358 Days

that show a cow's producing ability. We are offering young bulls with

Yearly Record Backing

at very moderate prices.

IOWANA FARMS, Davenport, Iowa.

Large Yearly Records

No other herd has as many large yearly records now being made.

No other herd has two herd sires with as large yearly record backing. How would you like to own a herd bull with such breeding? We can furnish you this kind. Write

Hargrove & Arnold Holstein Co., Norwalk, Ia.

VERY HIGHLY BRED YOUNG Holstein-Friesian BULLS

and two heifer calves are offered for sale cheap. All are registered, tuberculin tested and sound. Write or see "LIVE FAIR" VIEW, Waverly, Iowa. Otto Bradenburg, Mgr.

Bloomingdale Herd

...HOLSTEINS...

For twenty-five years have been bred for large production and good individuality. Segis Fayne Johanna, the first 50-lb. cow, is of our breeding and made her first 30-lb. record while in our herd. Many of the large producers have been bred here. Foundation stock a specialty.

A. A. Courtelyou, Somerville, New Jersey.

REGISTERED HOLSTEINS

25 cows due to freshen soon.
25 bred heifers. Also a few bulls.

If you want the best at reasonable prices, it will pay you to write.

DR. BLACKBURN, - CUBA, OHIO.

I ALWAYS HAVE HOLSTEINS FOR SALE

Write me before buying elsewhere.

L. E. CONNELL, FAYETTE, OHIO.

The growth in membership of The Holstein-Friesian Association of America from 146 in 1894 to more than 11,000 in 1918, evidences both a wider appreciation of the supremacy of the

Purebred HOLSTEIN

for farm and dairy purposes and a merited recognition of the prominent part this association has played in the development of the breed to its present high standard of type and productiveness. Every Holstein owner, or breeder will profit by connection with this progressive breeders' association.

HOLSTEIN-FRIESIAN ASSOCIATION OF AMERICA, Box 101, Brattleboro, Vt.

Holsteins At Auction

Send for information about the sales of healthy, reliable, registered cattle, held at *Brattleboro, Vermont, the First Tuesday and Wednesday of every other month. Come to Brattleboro, the Holstein-Friesian Capital of America.*

Address The Purebred Live Stock Sales Company.

FOR SALE: A BULL CALF

born November 12, 1917. This calf is seven-eighths white and a good individual. His dam has an A. R. O. record of 16 pounds; a second record of 22 pounds. And the sire is a 27-pound bull. Price $75. Write for photo and full information. **E. R. Emery, Stanton, Minn.**

Overland
TRADE MARK REG.

The Thrift Car

Reins or Steering Wheel?

A LONG, tiresome, time-wasting drive with horses is a short, pleasant, time-saving ride with an Overland.

Let an Overland perform innumerable *work duties* for you and *in addition* be an endless source of recreation and benefit for every member of your family.

Select this beautiful, roomy Model 90 and you save money in the first costs and maintenance.

You cannot get complete satisfaction from less advantages than it gives—

And you cannot get as much *value* in any other car for the low price of this Model 90.

It has a powerful, fuel-saving motor; narrow turning radius; rear cantilever springs; 106″ wheel base; 31x4 tires, non-skid rear; electric Auto-Lite starting and lighting and vacuum fuel system.

Because this Overland Model 90 gives *every* essential for complete satisfaction, the farmer's family can *enjoy* it as much as the farmer can *employ* it.

Organizing for Feed Defense

SANDERS SOSLAND, MISSOURI

VII—BRAN AND SHORTS SUPPLIES.

A SITUATION in direct contrast to that prevailing a year ago confronts war feed community purchasing organizations in the bran and shorts trade in the United States. A year ago the outlook was for the highest prices in history and an extremely short supply; this year, the outlook is for a large supply and for relatively low prices, thus working to the advantage of milk producers. The large supply of mill feeds is the result of a great crop of wheat in the winter wheat belt of the Southwest and prospects for a comparatively generous harvest in the spring wheat country of the Northwest. The relatively low prices prevail because of regulations governing the milling and feedstuffs industry as framed by the United States Food Administration at Washington.

The second largest production of wheat ever witnessed in the winter wheat belt of the Southwest was harvested this year. The July estimate of the United States Department of Agriculture on the winter wheat yield was 557,339,000 bushels, compared with the final yield in 1917 of 418,070,000 bushels. Private crop experts declare the government July estimate is too low, and the general opinion prevails that 600,000,000 bushels is a conservative estimate on the winter wheat crop. Farmers almost generally report greater yields following threshing operations than had been expected.

In the spring wheat belt of the Northwest, the outlook for a large crop is bright. The July estimate of the Federal Department of Agriculture indicated a yield of 333,591,000 bushels compared with 232,758,000 bushels in the preceding year. Development of the spring wheat crop in the Northwest since the issuance of the July crop estimates of the government has been rapid and under highly favorable conditions. The indicated yield of wheat over the entire United States is 899,930,000 bushels, compared with 650,828,000 bushels in 1917.

In the Southwest, the wheat is of exceptionally fine quality, the bulk reaching terminal markets grading No. 1 and No. 2, with only occasional cars of No. 4 or sample wheat. The crop over the entire country—in the Northwest the wheat is now being harvested—matured under highly favorable conditions, and little low grade grain was produced. This, of course, is an important factor in the bran and shorts situation, for a better, more valuable offal, as well as a larger supply, will be offered by flour millers.

RUNNING STRAW FROM THRESHER INTO MODERN DAIRY BARN OF B. C. ROSS, WISCONSIN, FOR WINTER USE. THIS IS A SPLENDID WAY TO PRESERVE STRAW AND THIS METHOD SHOULD BE MORE GENERALLY PRACTICED

New Federal Regulations

In planning purchases, war feed community clubs must have a thorough understanding of the federal regulations governing the milling of wheat and the distribution of the products of the miller. The new government regulations on the 1918 crop, while not entirely different, are unlike the control operations of the past 10 months, and leaders of war feed clubs should not become confused in planning purchases. The important features of the revised government regulations now in effect are that a maximum price has been placed on the products of the miller, flour, bran, and shorts, sales by rehandlers are to be made at an allowable profit, and the extraction of flour from the wheat berry is limited. No miller has any particular allotment of wheat which he may grind in the crop year, but may operate his plant to as great a capacity as he desires.

The various prices of the millers' products were derived in part by an analysis of the freight schedule which became effective with the advance on June 25. For instance, two mills in Kansas, possibly only a few miles apart, may have different schedules of prices. In Kansas City, the Food Administration—the Cereal Division is handling the matter of prices since the abandonment of the Milling Division—has set a maximum price on bran of $22.26 per ton, in carlots, bulk at the mill. Mixed feed maximum price in Kansas City is $23.51 per ton, and for middlings, shorts, and red dog the maximum level at which Kansas City millers may sell is $24.-26. Similarly computed, Omaha, Neb., has the same schedule of prices as Kansas City. The schedule of maximum prices at Minneapolis, Minn., are $23.36 for bran, $24.61 for mixed feed, and $25.36 for middlings, shorts, and red dog.

Export Wheat of Flour?

Outstanding in the matter of supplies of bran and shorts is the question of exporting more wheat and more flour to our allies in Europe. This question is of vital importance to the dairy industry. In the past year, Food Administrator Hoover followed a policy of exporting flour almost exclusively, having the wheat ground in this country. It is understood that Mr. Hoover desires to follow a similar policy this year, but the grain corporation and the food controllers of Britain and other allied countries are asking America for wheat to be ground in their own mills. Associations of dairymen ought to urge that the wheat be ground in the United States.

War feed clubs will do well to follow closely the developments of the export situation. Should the policy of exporting more flour be continued, it is possible, but hardly probable, that lower prices will be witnessed in the market for bran and shorts; while, on the other hand, exporting more wheat would cause the maintenance of the maximum level and difficulty in obtaining sufficient feed. Some food officials at Washington maintain that dairymen could substitute other feedstuffs in the event that a shortage results from exporting more wheat, but dairymen should oppose this view as detrimental to their industry and inimical to the policy of the Food Administration to encourage greater production of food.

Eager Buying in the Southwest

Mills in the Southwest are operating at maximum capacity, thanks to the free movement of wheat from the country, yet they are unable to supply the demand for mill feeds. This eager buying may be only temporary, for supplies in consumers' hands over the entire country have been near this point of exhaustion for months. But Southwestern millers estimate that several months will be required to supply consumers with sufficient feed, the demand having been augmented by dry weather over the grazing districts of the Southwest. In the Northwest, millers are still restricted in their operations because of a shortage of wheat. This situation will be relieved as soon as farmers complete their harvesting and threshing operations in the spring wheat belt. Many millers in the Northwest

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 6 months, 50 cents; 3 months, 25 cents. Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through Wm. Dawson & Sons, Cannon House, Breams Building, London, S. C., Eng., or their agents, including the news dealers and book sellers in all foreign countries.

Subscription agents for New Zealand—Bray Bros., Agricultural Hall Building, Dunedin, New Zealand. Also—The New Zealand News Co., 150 Wakefield St., Wellington, N. Z.

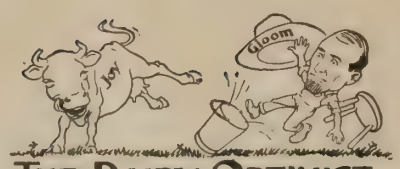
Subscription agents for Australia—Australasian News Co., 226 Clarence St., Sydney, Aust.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $2.56, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of the Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome immoral and quack advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.



Entered at Fort Atkinson, Wis., as second class matter.

Produce Pork in the South

Seven reasons why the South should give more attention to hog raising are given as follows in Extension Bulletin 10, published by the Agricultural College at Clemson College, S. C.:

1. The people of the South are large consumers of pork.
2. By far the greater portion of the pork consumed by Southern people is brought from other sections at a very high cost to the consumer.
3. Hogs can be raised successfully in the South if given reasonable attention.
4. Hogs are profitable consumers of farm by-products such as damaged grain, refuse potatoes, skimmilk, kitchen slops, etc., thereby turning to profit much that would otherwise be a waste.
5. Hogs develop and reproduce at an earlier age than any other farm animals.
6. In the corn belt, the hog is commonly called the "mortgage lifter." In the South the hog can do much towards abolishing the "credit system."
7. The problem of marketing is being solved in South Carolina by the building of packing houses, thereby affording a home market for meat animals every day in the year.

It is not possible to state the difference between silage made from ripe and unripe corn. If it were possible to determine just how many days or weeks the corn would have taken to mature properly for ensiling, then we could give a close estimate as to how much nutriment has been lost. During the three or four weeks prior to maturity, corn takes up a great amount of nutriment from the soil, and if cut three weeks before it should be there is a loss of about 20 to 30 per cent in its feeding value.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

His Favorite Nook

The parlor is a pretty place,
All tuckered out with curtained lace.
There is an organ, and it's fine
To see the satin covers shine.
The dining room is welcome, too,
With scent of grub and China blue.
But it's the dairy house that seems
To satisfy my fondest dreams.

The young folks like to sit and spoon
On the verandah, with the moon.
Ma thinks the sitting-room is best
For peaceful quietude and rest.
And Katie says our kitchen there
Of all the rooms, is fine and fair.
But I—well I in truth prefer
Around the dairy house to stir.

The clean stone walls—the spotless floor,
The sun that filters through the door,
The perfume of the singing churn,
That makes your jaded palate yearn,
The separator, with its song,
The smell o' milk that comes along—
Here is a fairy sort of place
That's good for all th' human race.

"So you want to be a Farmerette? Can you milk a cow?"

"I've never tried. But it isn't difficult, is it? You wait until she's ready and then put a bucket under her."

A Letter Home

"Dear Mamma:—I like spending the summer on a dairy farm. There are so many strange things. Cows don't give butter. First you get milk and disturb it dreadfully. I think the bossies are perfectly nice, but there's a man cow here with a very disagreeable disposition. A hired boy tried to argue with him and he made the boy move out of the lot. Otherwise it's nice and peaceful here. Lovingly,

Marjorie."

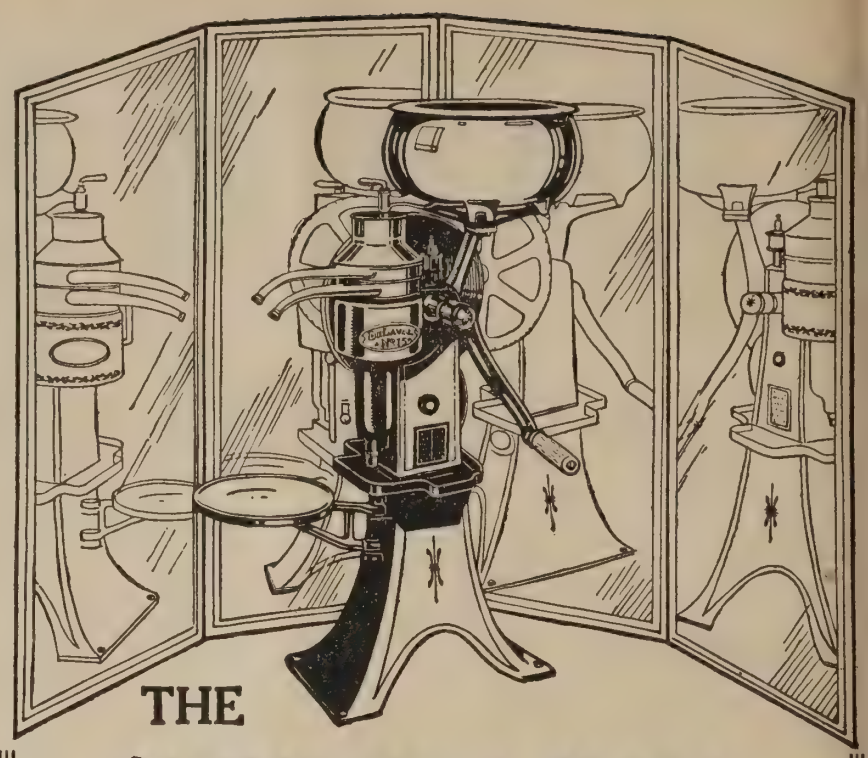
You can say all you please about squab, porterhouse steak, chicken pie, lamb stew, and the rest of it, but for steady wear there's nothing can beat a piping hot order of ham and eggs.

"I read the other day where government bulletins tell the public to 'eat more milk'.

"Sounds reasonable. If it was cream from my herd, they'd have to chew it. That's how thick it is."

Hiram's Aunt Jane says she likes corn on the cob, but it's so much trouble gettin' th' butter out of her bangs.

What Has Become



Of the pretty little girl with the red hair who used to go on straw rides with you and promised she'd be your wife when you grew up and had an ortymobile?

Of the freckle-faced, lovable boy who went fishin' with you down by Miller's pond and used to swipe such bully good doughnuts from his mother's pantry?

Of the grocer who never complained when you cut off a little slice of cheese, or took a few dried apples, or watched him when he ground the coffee?

Of the crabbed old codger who owned that big pasture with the apple trees and the swimmin' hole and the blackberry patch, and who always loaded his shotgun with salt pork and peas when you trespassed?

"I've been wishin' for a week," observed Uncle Hi Hikory of Glendale Dairy, "that I could send all th' moles on my farm to a German detention camp. It's just the sort of humane treatment I'd like to dish out to 'em."

THE
NEW DE LAVAL
CREAM SEPARATOR

Every Reflection Shows Perfection

VIEWED from every angle, the De Laval is distinctly in a class by itself. It has a business-like appearance. It looks as if it were well made, and it is. It looks sturdy, and it is. There is no make-believe about it anywhere, from the wide-spreading substantial base to the solid, seamless, symmetrical supply can.

It's no wonder that big dairymen and creamerymen who have for years made a careful study of dairy methods and machinery refuse to consider any other separator but the De Laval. They know that from every angle—clean skimming, ease of operation, freedom from repairs, durability—there is no other cream separator that can compare with the De Laval.

They know that it has a record of 40 years of service behind it. They know that it can be depended upon. They know that they can't afford to take chances with any other cream separator.

And neither can you.

Order your De Laval now and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or if you don't know him, write to the nearest De Laval office as below.

The De Laval Separator Co.

165 Broadway, New York 29 E. Madison St., Chicago

Every New De Laval is Equipped with a Bell Speed-Indicator

Fruit and Vegetable Storage

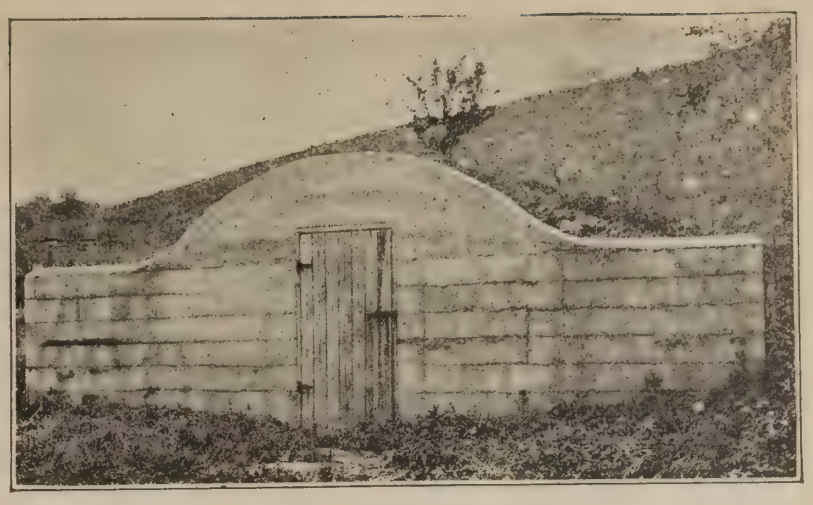
H. COLIN CAMPBELL, Illinois

WHAT the farmer raises is not so important as what he can use or sell to advantage. Some crops, such as grain, may be stored for months without much loss. Others, such as milk and other dairy products, must be marketed almost daily. Between these two extremes are the fruit and vegetable crops, which on most farms must be marketed with little delay. By using well built storage cellars it is possible to keep these products in condition for sale or use almost through the year, thus securing the high prices paid when there is a demand.

Vegetables and fruits stored under suitable conditions are improved in flavor and quality. The quantities of farm produce maturing almost at one time mean an economic loss unless the greater portion can be preserved for future use. Storage cellars are the most efficient means for this purpose and under proper care the fruits and vegetables retain their freshness through the entire winter with practically no loss through decay or shrinkage.

Concrete is an ideal material for the construction of storage cellars and the accompanying drawings indicate some of the essential features of such structures. Three principal storage requirements are readily provided in a concrete storage cellar. The first is insulation against both heat and cold. If too warm the produce will mature too rapidly and soon decay, while if allowed to freeze its value is lost. Concrete cellars permit control of moisture and ventilation and so preserve a uniform temperature.

Ventilation is essential. The air must circulate through the cellar and the produce must be so stored that this is possible. Racks are preferable to bins and open barrels or baskets are better than air tight packages.



Enough moisture must be present to prevent drying out but floors and walls must not be continually wet. Pans of water or small built-in tanks, over which the incoming air passes, will supply the necessary moisture.

While different classes of vegetables require somewhat different care in the storage building, for all practical purposes such produce as apples and potatoes do well at a temperature between 30 degrees and 40 degrees F. The normal temperature of the earth is about 50 degrees, much too high for ideal storage. During the early fall months there are nights when the temperature drops near or below the freezing point and advantage may be taken of these nights to cool the storage cellar. Cooling can be accomplished by building a good ventilating system which will provide a rapid circulation and change of air. In cold weather the temperature must be closely watched and the approach of freezing temperatures calls for reducing the circulation of the air. Closing the ventilators will do less harm at very low temperature than at higher ones.

Concrete is not subject to rot or decay, and grows stronger with age. It may be necessary to spray the walls and floors to give the required humidity at times. Cement is not subject to the attacks of fungi, rust, or other deteriorating agencies. This property of concrete makes it ideal for storage cellars.

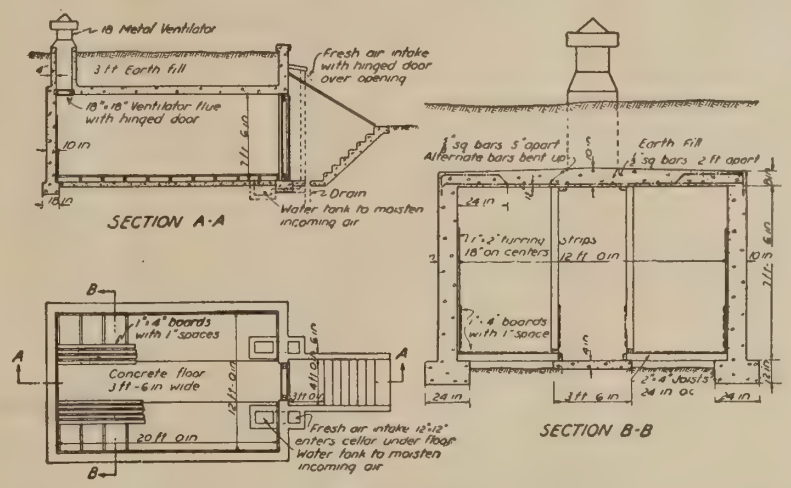
Storage cellars, such as the ones shown in the plans, will give perfect storage facilities for the farm and home and can be built in any locality, largely of local materials, and with farm labor. Time is an element also, and progress on a concrete storage cellar is regulated only by the labor available. The materials, cement, sand, and broken stone or pebbles, can be obtained in sufficient quantities to complete the work without delay.

Probably the cellars shown are of ample size to store all the apples, potatoes, and other produce on the average farm. They will store about 600 bushels of apples or potatoes, and should additional space be required, the length may be increased as desired. One of the best places for storage cellars of this kind is in the side of a hill, as this will usually mean less excavating and filling and insure good drainage. Under favorable conditions it may be possible to build the storage cellar with a grade entrance in which case a short entrance hall with double doors should be arranged, so that there will be protection against extreme changes of temperature.

CONCRETE ROOT CELLAR ON FARM OF FORREST HAYDEN, INDIANA

Construction of either of these storage cellars requires excavation to the lines indicated on the drawing. The concrete for all work except the roof should be in the proportion of 1 part Portland cement, two and one-half parts clean sand, and 4 parts crushed stone or pebbles. The sand should be evenly graded from fine to that which will just pass a one-fourth inch mesh screen, while the crushed stone or pebbles should vary from one-fourth inch up to one and one-half inches. For the roof, and for the rounding roof of the curved top, the concrete must be 1 part Portland cement to 2 parts sand and 3 parts broken stone or pebbles.

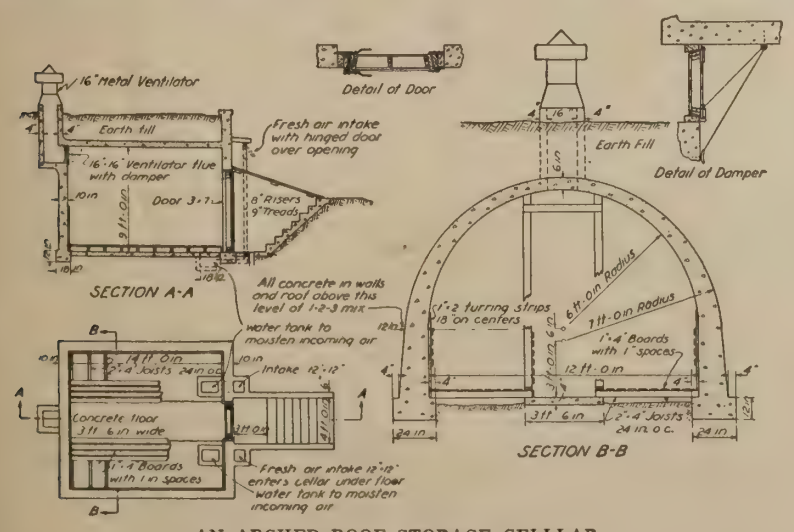
Forms for the walls should be of matched inch boards, held in place with plank supports and solidly braced and for the flat roof one should make sure that the supports are strong enough to stand under the heavy load of concrete. The flat roof must be reinforced with five-eighths inch steel rods spaced 5 inches apart and placed one and one-half inches from the bottom of the roof slab. Alternate bars are bent up at a point 2 feet from the inside cellar wall, and the ends of all rods are bent at right angles to form a hook about 3 inches long. This insures good anchorage in the concrete. One-half inch square bars should be placed 2 feet apart or run lengthwise of the cellar. The flat portions as well as the top of the curved portion should be carefully smoothed over before it hardens.



In mixing the concrete just enough water should be used to bring the mass to a quaky or jelly-like consistency, and the concrete should be placed immediately after mixing. It is best to do the concreting as rapidly as possible to prevent possible seams where the work stops for a time. In moderate weather the forms for the side walls may be taken off in 3 or 4 days, after which the concrete should be kept wet for about 2 weeks. At the end of 3 weeks the forms or centering for the arch or roof may be taken out if the temperature and weather has been mild and even during that period. Care must be used in removing the forms, as any jarring is apt to injure the concrete. After the forms are all removed the concrete for the floor may be put in.

Be sure to build in the ventilating flue as shown, as well as the fresh air intakes. These must be provided with dampers or other means for reducing their area when required. The water tanks below the floor should be kept filled and the air passing over them will usually take up moisture to the required humidity.

Regardless of the materials stored the cellar should have a floor of inch strips spaced an inch apart and laid on joists as indicated. The walls should be similarly furred or bins built in, as this will permit the circulation of air necessary for ventilation and preservation of the contents of the cellar.



When the earth fill is put over the cellar, puddle it down with plenty of water. This will not only compact the earth but will assist in the hardening of the concrete.

Concrete storage cellars are built to stay and if of proper size for the farm, should pay for themselves in one year. This year, with high prices for all farm produce, and the difficulty in making shipments, a suitable cellar will enable one to market his crops in accordance with supply and demand and the most favorable conditions. Waste may be entirely prevented if crops are stored carefully when in proper condition. No building on the farm will return a greater profit than a well-built concrete storage cellar.

A FLAT ROOF STORAGE CELLAR

This cellar has a capacity of 800 bushels, or 40 bushels to each foot in length. Greater or less capacity can be secured by adding to or taking from the length. To build it will require 47½ bbls. cement, 16½ cu. yds. sand, 28 cu. yds. pebbles, and 1,000 lbs. steel.

AN ARCHED ROOF STORAGE CELLLAR

It has a capacity of 500 bushels which may be increased by adding to its length. Silo or tank forms may be used for the arch. The material required is 43 lbs. cement, 14 cu. yds. sand, and 21¾ cu. yds. pebbles.

Cultivating the Appreciation of Animals

"The admiration of a good domestic animal is much to be desired. It develops a most responsible attitude in the man or woman. I have observed a peculiar charm in the breeders of these wonderful animals, a certain poise and masterfulness and breadth of sympathy. To admire a good horse and to know why he admires him is a great resource to any man, as also to feel the responsibility for the care and health of any flock or herd. Fowls, pigs, sheep on their pastures, cows, mules, all perfect of their kind, all sensitive, all of them marvelous in their forms and powers —verily they are good to know."—Dr. Bailey in "The Holy Earth".

"The spaces of land and sea are nothing where common purposes bind."—General Pershing.

Wisconsin Accredited Herds Transferred

C. P. NORGORD Commissioner of Agriculture

BY the action of the United States Live Stock Sanitary Association at Chicago December 4, 1917, and through the co-operation which the Wisconsin State Department of Agriculture at the Capitol has arranged with the Bureau of Animal Industry, the Wisconsin Accredited Herd System has been made a national system and will hereafter be known as the State and Federal Accredited Herds System. The qualifications for this co-operative list will be practically the same as those formerly required for the state accredited herds, and all of the herds of the state accredited list will be transferred to the new list as soon as they have fully qualified. A regular list of these herds will be published by the Bureau of Animal Industry and the Wisconsin State Department of Agriculture, the same to be sent to all states in the Union.

All states, and foreign nations as well, now thoroughly appreciate the importance of keeping out bovine tuberculosis by preventing it from being shipped in through the importation of cattle. Practically all state authorities fully recognize the fact that a single animal tested from a herd which has not been tested before is an unsafe animal as she may carry the germ in an undeveloped state, later to develop into a complete tubercular condition. They recognize the fact that the only safe herds from which to make purchases are those that are tested annually under the supervision of state and federal authorities.

Many states in the Union have already taken the position that all animals shipped in must be subject to a retest sixty days after their arrival, reactors to revert to the original owner, except animals coming from accredited herds which can be shipped to all states upon the accredited herd certificate.

The European nations now at war have practically destroyed their strains of dairy cattle. Fortunately, Wisconsin and the other great dairy states have secured the pick of the great herds of Europe and have bred from them better strains of live stock than Europe ever had. When the war is closed, we shall have to restock Europe and return to them the Holsteins, Guernseys, Brown Swiss, Shorthorns, and other valuable strains of live stock. This means a great trade for Wisconsin and other live stock states. Naturally these countries will permit no tubercular animals to be imported. The accredited herds will, therefore, play the most important part in the rehabilitation, and the owners of state and federal accredited herds will reap the largest share of this trade. It, therefore, becomes important for all owners of cattle to take steps at the earliest possible date to get their herds qualified for the accredited list. The State Department of Agriculture and the Federal Bureau of Animal Industry, therefore, send out herewith an urgent appeal to county agents, live stock breeders' associations, bull associations, cow testing associations, and all other live stock interests to immediately urge the preparation of herds for the Wisconsin State and Federal Accredited List, secure signatures of people who wish to have their herds tested for this purpose, send them in to the Department of Agriculture, and make arrangements for tests by local veterinarians certified to make accredited herd tests by the department.

The state and Bureau require temperatures to be taken at intervals of two hours to be conducted up to the twentieth hour from the time of injection, thus securing seven temperature records after the hour of injection of tuberculin. By the co-operative plan local veterinarians who have been approved by the Department can make the first annual or the first two semi-annual tests, but when making the last test, they must be accompanied by a state or federal inspector as no herds will be accredited other than those whose tests have been thus supervised by a state or federal employee.

The detailed regulations adopted by the Bureau of Animal Industry and the state and by the U. S. Sanitary Board are herewith presented:

1. A tuberculosis-free accredited pure-bred herd is one which has been tuberculin tested by the subcutaneous method, or any other test approved by the Bureau of Animal Industry, under the supervision of the Bureau of Animal Industry, or a regularly employed veterinary inspector of the state in which co-operative tuberculosis eradication work is being conducted jointly by the United States Department of Agriculture and the state. Further, it shall be a herd in which no animal affected with tuberculosis has been found upon two annual or three semi-annual tuberculin tests, as above described, and by physical examination.

2. The entire herd, or any cattle in the herd, shall be tuberculin tested or retested at such times as is considered necessary by the federal and state authorities.

3. No cattle shall be presented for the tuberculin test which have been injected with tuberculin within 60 days immediately preceding or which have at any time reacted to a tuberculin test.

4. No herd shall be classed as an accredited herd in which tuberculosis has been found by the application of the test, as referred to in paragraph 1, until such herd has been successfully subjected to three consecutive tests with tuberculin, applied at intervals of not less than six months, the first interval dating from the time of removal of the tuberculous animal from the herd.

5. Prior to each tuberculin test, satisfactory evidence of the identity of the registered animals shall be presented to the inspector. Any grade cattle maintained in the herd, or associated with animals of the herd, shall be identified by a tag or other marking satisfactory to the state and federal officials.

6. All removals of registered cattle from the herd, either by sale, death, or slaughter, shall be reported promptly to the said state or federal officials, giving the identification of the animal and, if sold, the name and address of the person to whom transferred. If the transfer is made from one accredited herd to another accredited herd, the shipment shall be made only in properly cleaned and disinfected cars. No cattle shall be allowed to associate with the herd which have not passed a tuberculin test approved by the state and federal officials.

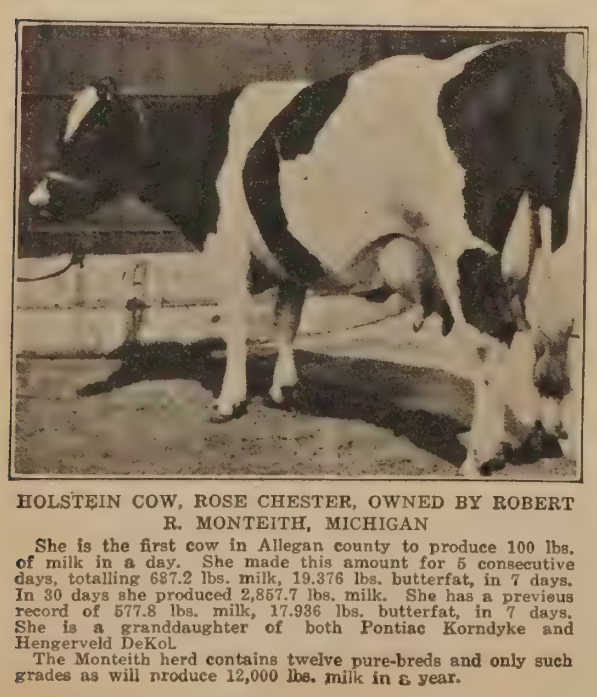
7. All milk and other dairy products fed to calves shall be that produced by an accredited herd, or, if from outside or unknown sources, it shall be pasteurized by heating to not less then 150 F. for not less than 20 minutes.

8. All reasonable sanitary measures and other recommendations by the state and federal authorities for the control of tuberculosis shall be complied with.

9. Cattle from an accredited herd may be shipped interstate by certificate obtained from the office of the state live stock sanitary officials of the state in which the herd is located or from the office of the Bureau of Animal Industry, without further tuberculin test for a period of one year, subject to the rules and regulations of the state of destination.

10. Strict compliance with these methods and rules shall entitle the owners of tuberculin-free herds to a certificate. "Tuberculosis-free Accredited Herd," to be issued by the Bureau of Animal Industry and the state live stock sanitary authority. Said certificate shall be good for one year from date of test unless revoked at an earlier date.

11. Failure on the part of the owner to comply with the letter or spirit of these methods and rules shall be considered sufficient cause for immediate cancellation of co-operation with them by the state and federal officials.



Appearance of Reactors.—When one or a limited number of reactors appear in an accredited herd, the herd shall remain on the accredited list, but no animal shall be sold from the herd as an accredited animal until such herd has passed the test necessary t reinstate it. Any animal sold for inter state shipment during this time pre vious to the reinstatement of all th animals in the herd shall be tested t comply with the requirements of th state into which it is to be shippe just as animals not of the accredite list.

Reinstating a Herd Which Ha Shown Reactors.—A herd havin shown one or a limited number of re actors can be reinstated by passin two semi-annual tests.

Status of Young Animals.—An animal too young to be tested at an regular herd test may be sold as a accredited animal without a specia test until the next regular test of th herd.

PENCOYD'S GOLDEN MAY SECRET, THE GUERNSEY BULL THAT WAS SOLD TO W. H. DUPEE, CALIFORNIA, FOR $10,100, BY W. G. JAMISON & SONS, WISCONSIN

HOLSTEIN COW, ROSE CHESTER, OWNED BY ROBERT R. MONTEITH, MICHIGAN

She is the first cow in Allegan county to produce 100 lbs. of milk in a day. She made this amount for 5 consecutive days, totalling 687.2 lbs. milk, 19.376 lbs. butterfat, in 7 days. In 30 days she produced 2,857.7 lbs. milk. She has a previous record of 577.8 lbs. milk, 17.936 lbs. butterfat, in 7 days. She is a granddaughter of both Pontiac Korndyke and Hengerveld DeKol.

The Monteith herd contains twelve pure-breds and only such grades as will produce 12,000 lbs. milk in a year.

Fodder Substitutes in Foreign Countries

The very acute shortage of feeding stuffs in France, the Central Powers and the northern neutrals has led t experiments with all sorts of wil vegetation, often resulting in thei successful adoption as substitutes fo ordinary fodder.

In France, where the shortage ha been keenly felt, especially in th case of oats, the first experiment were made with a kind of seawee called laminaires, common on th Breton coast. Experiments showe that as a feeding stuff, three pound of seaweed were equivalent to fou pounds of oats. Horses which wer fed on it grew fatter during the pe riod of experimentation than thos fed on oats; and animals sufferin from lymphangitis, an epidemic dis ease which is rife among wounde horses at the front, improved unde the diet, the disease eventually dis appearing entirely. Grass wrack, an other kind of seaweed, is also used i France with success; and in Ger many, Holland, and Denmark sea weed of various sorts is used exten sively.

The French authorities recommen the use of fresh reeds for pigs, and reedflour for fodder was put on th market in France this February Reeds are also used in Germany where the minister of agriculture re cently declared that fodder obtaine from reeds procured green before th blossoming period is quite equal t good meadow hay, The collection an sale of reeds is regulated in German by the government, and a maximu price of $1.25 per hundredweight i fixed. With acorns, horse chestnut and seeds of forest trees the Frenc government has made the most care ful experiments, and has issued fu information as to the use of these fo substitutes. Acorns may be eaten b all animals, though in differin amounts. For horses, seven pints o

THE WHITE EAGLE DAIRY SUPPLIES THE CAPITAL CITY OF MISSOURI WITH A NEAT APPEARING AND WELL EQUIPPED PLANT FOR HANDLING THE MILK USED BY ITS CITIZENS

Columbia's New Dairy Plant

D. V. VANDIVER, Missouri

IFFERENT from most dairies, the White Eagle Dairy is owned principally by the producers of milk, and it is engaged in the retailing and wholesaling of milk, cream, butter, ice cream, and cheese. It has been in business for over twenty years at Columbia, Mo., and has just completed and moved into its new plant. In the construction of the building, extreme care was exercised to insure sunlight, the most important question to consider from a sanitary standpoint, and an excellent location was secured.

The white tile front and salesroom make a most attractive showing and the operating room is so arranged as to make possible the greatest efficiency in the handling of the product.

A long insulated cabinet in the retail salesroom is cooled by brine from the cold storage plant and contains milk, cream, buttermilk, butter, cheese, and ice cream, all so arranged that the necessary temperature is maintained in each compartment.

Ice cream is frozen by the continuous brine freezers and placed in the dry hardening room, next to which is the general cold storage room in which raw cream and milk are stored.

The producer drives to an unloading platform where his milk is weighed, sampled, and deposited in the pasteurizers; his cans slide down a chute to the wash room and he picks them up, washed and sterilized at the other end of the plant, and drives on out.

After being pasteurized the milk is then bottled and placed in storage for the drivers in the morning. The sweet and sour cream is handled from the same station and is deposited in different pasteurizers and from there in the churn or storage room.

Five delivery wagons distribute the milk and cream and a truck is employed mornings and evenings, hauling in milk from the farms and making deliveries of ice cream during the day.

Dairy farming in Boone County has received a stimulus as a result of this excellent plant and but for the temporary shortage of farm labor, many more farms would be producing milk, as the market is always good on dairy products.

A formal opening of the new plant attracted between 4,000 and 5,000 people who were invited to visit the plant and see how the milk, cream, ice cream, and butter were handled. It was a pretty expensive day for the company and ice cream was in big demand when it could be had for the asking, but the company feels that it was money well spent and the large increase in the volume of business testifies to the popularity of the new plant. The company advertises the fact that it has no secret formulas or processes and the public is invited at all times to inspect the back as well as the front of the plant.

SHOULD ALFALFA WINTERKILL?

JAMES LACEY, Wisconsin

HERE in Green County, where nearly seventy-five per cent of the alfalfa fields were either partially or wholly killed by the past severe winter, a good field of alfalfa is something hard to find. Most of them are badly mixed with June grass. Others show the effects of winter-killing in the numerous patches of weeds. But once in a great while a field is found in which the stand of alfalfa is as good as any enthusiast could wish.

On June 14th, I was on the farm of Ted K. Hefty in Washington Township. Among other interesting crops on his splendid farm he showed me thirty-five acres of the finest alfalfa that I have ever seen, but the shoots on the crowns had begun to show, and Mr. Hefty explained that he intended to begin cutting the hay on the following day.

The remarkable thing about this stand of alfalfa was that it should be so vigorous and apparently unaffected by the severity of the past winter. Neighboring fields looked, in most instances, as if not more than half a stand would be produced. This field would yield one and one-half to two tons from the first cutting.

I asked Mr. Hefty why this field should be so much better than others in the same neighborhood.

"Well, to begin with," he told me, "I always take a great deal of pains and exercise a good deal of care in preparing the ground for my alfalfa seeding. In addition to this, I always make sure that I have chosen the right kind of soil to give my alfalfa a good start. Alfalfa must have plenty of limestone, and limestone is very abundant in the soil of this field. I had the ground tested and it showed no acidity whatever. The seed had been inoculated. I always take the trouble of inoculating the seed before it is sown, for I find that the extra labor is labor well spent. By inoculating the seed, and by determining whether the land is acid, I think I do away with a great many uncertainties in alfalfa growing. So much for giving the alfalfa a start.

"After alfalfa has become firmly established in a field, I have found that two factors cause more winter-killing than all other factors combined. These two are: First, lack of drainage and consequent formation of ice sheets; and second, pasturing or cutting the alfalfa too late in the fall. Neither of these factors caused any trouble here.

"The field, as you see, is rolling enough to drain very well indeed. I find no pools of water here, but in parts of the field heavy rains do some damage by causing ditches. I would rather have these ditches in the field, though, than I would to have water standing there long enough to kill out the alfalfa. During the past winter there was never any ice on this particular field, and I know that this fact is responsible, in part, for the present excellent stand.

"The second important cause of winter-killing is too late cutting, or pasturing of the alfalfa crop. Last fall I did not cut the third crop and this field has never been pastured. In October the third crop stood about twelve inches high. Last winter no part of this field was bare of snow, for the large growth prevented the snow from blowing and drifting.

"On other fields I have noticed that on southern slopes the alfalfa is better because the snow remained for a longer period of time. The stand on this field is even, because the snow remained evenly distributed on the field.

"Personally, I think that a good fall growth is the best preventive for winter-killing. I would much rather leave the third crop on the field than I would to get that extra amount of feed and by doing so sacrifice the entire stand in the following years. I have found that pasturing is even more destructive than late cutting. I try to avoid the causes which I have just mentioned. Maybe, though, this has nothing to do with my good crop this year."

I think it did.

BELLE OF SOUTH FARM 2ND, A SEVEN-YEAR-OLD AYRSHIRE OWNED BY WENDOVER FARM, NEW JERSEY, HAS COMPLETED A MATURE RECORD OF 15,577 LBS. MILK, 4.24% TEST, 660.60 LBS. FAT

Belle of South Farm 2nd was born April 12, 1910. She was bred by John Sherwin, Ohio. Her sire is Fizzaway's Royal Star with several daughters in the Advanced Registry. Her dam is Island Belle. Belle of South Farm 2nd has two previous records: 9,390 lbs. milk, 392.43 lbs. fat; and 12,305 lbs. milk, 520.31 lbs. fat. She was sold to Wendover Farm at the New England Club consignment sale in June, 1916, dropping her calf while in transit to New Jersey. She dropped a heifer calf which was sold at the 1918 sale at Hartford, Connecticut, for $400.—J. G. WATSON, Vermont.

Out of the last harvest the American people, by abstinence, saved 140,000,000 bushels of wheat to feed the hungry allied nations; and these same people are going to stay right on the sugar job and see it through.

The present household sugar ration—with little chance of increase—is two pounds a month in America, two pounds in England, one and one-half pounds in France, and one pound in Italy.

Coming Events

August 30 to Sept. 8, Michigan State Fair, Detroit, Michigan. Secretary, G. W. Dickinson.

September 1 to 6, Nebraska State Fair, Lincoln, Nebraska. Secretary, E. R. Danielson.

September 2 to 6, Connecticut Fair, Hartford, Connecticut. Secretary, H. C. Parsons.

September 2 to 7, Indiana State Fair, Indianapolis, Indiana. Secretary, Chas. Kennedy.

September 2 to 7, Spokane Interstate Fair and Live Stock Show. Acting Secretary, W. L. Tennant.

California State Fair, Sacramento, California, August 31 to Sept. 8. Secretary, Chas. W. Paine.

Kankakee Interstate Fair, Kankakee, Illinois, August 26 to 31. Secretary, Len Small.

Ohio State Fair, Columbus, Ohio, August 26 to 31. Secretary, E. V. Walborn.

Iowa Dairy Cattle Congress, Sept. 30—Oct. 6, Waterloo, Iowa. Manager, E. S. Estel, Waterloo, Ia.

Sept. 16-21. Southwestern Jersey Cattle Show, Kansas City, Md., H. E. Colby, Sec.

September 2-7. Minnesota State Fair, St. Paul. Thos. H. Canfield, Secretary.

August 30. Field Day of the New England Guernsey Breeders at Albamont Farms, Campton, New Hampshire.

New York Butter Market

NEW YORK CITY, August 13:—Receipts continue to show a shrinkage and the average quality of butter received continues poor. Quality, if anything, is lower than last week, and at present there is no visible relief. Last week, according to weather reports, the dairy sections were experiencing the hottest weather of the season and while there was a temporary relief late in the week the weather has again become torrid. Butter dealers feel that for the next few weeks there will be no improvement in the quality of butter received. Buyers are not anxious to stock up with liberal quantities of butter under present conditions with the result that there is a scarcity of healthy buying.

In spite of the absence of life in the market, values have continued to work up slowly. The reason for that is because of the tendency for dealers to hold their high grade butter in anticipation of the expected minimum production of high grades because of the heat. There is some accumulation of lower grades of butter and dealers expect that there will be a widening in the range of values of butter of different grades. The condition that has prevented any greater range of values up until the present is that there have been some out-of-town buyers on the market who have picked up considerable quantities of poorer lots of butter.

There has been an advance of a half cent in quotations on butter during the past week. On August 6 extras (92 score) were quoted at a range of 45@45¼c. On Thursday the price advanced a quarter cent and yesterday a price of 45¾c was established. Yesterday's quotations have been maintained today. Additional quotations today are: Higher scoring than extras (93 score or higher), 46@46¾c; firsts, (88 to 91 score), 43¾@45½c; and seconds, (83 to 87 score), 42@43½c.

W. B. LIVERANCE.

Sale Announcements

Aug. 27—Guernseys, Dispersions of the T. D. McChesney, Minette, N. Y., and Winthrop Condin, Mt. Kisco, N. Y., herds at New Castle Farm, Mt. Kisco, N. Y. Leander F. Herrick, Worcester, Mass., Manager.

Aug. 31—Holstein Dispersal Sale, Sweet Brook Farm. The Pure-bred Live Stock Sales Co., Brattleboro, Vt.

Sept. 4—Holsteins, Sauk Valley Dairy Farm, Holsteins. O. S. Cass, Sauk Center, Minn.

Sept. 11—Holsteins. Consignment Sate at Cuba, N. Y., Fair. L. J. Waldock, Mgr., Cuba, N. Y.

Sept. 11—Holstein Dispersal Sale. Springdale Farms, Fishers, Ind., Dr. S. P. Scherer, Owner.

Sept. 12—Ayrshires. Consignment Sale at Cuba, N. Y., Fair. L. J. Waldock, Mgr., Cuba, N. Y.

Sept. 13—Guernseys and Jerseys. Consignment Sale at Cuba, N. Y., Fair. L. J. Waldock, Mgr., Cuba, N. Y.

Sept. 17—Holsteins. Centralia Calf Farm, Centralia, Ill.

Sept. 18—Holsteins. W. F. Phelp's Holstein Sale, Joplin, Mo.

Sept. 25-26—Holsteins. Absolute Disperison of the Chas. Prange and S. E. Gehrig herds at New Douglas, Ill.

Oct. 1—Holsteins. Dispersion of Broadmead Farms Holstein Herd at Union City, Mich. Thos. B. Buell & Son.

Oct. 3—Holsteins. Dispersion Sale Prairiedale Farm Herd. Galt & Spencer, Dixon, Ill.

Oct. 4—Holsteins. Redwood Holstein Farm Dispersion at Redwood Falls, Minn. Glenn W. Gold.

Oct. 4—Guernseys. Dispersion of Sylvanite Guernsey Herd at Baraboo, Wis. Richard F. Klemm.

Oct. 9—Holsteins. Dispersion of Avoca Lodge Holstein Herd at Morrisson, Colo. Donley & Simpson, Morrison, Colo.

Oct. 10—Holsteins. Fred E. Zimmerman, Washington, Ill.

Oct. 12—Jerseys. Texas Jersey Cattle Club Sale at Cleburne, Texas. Mrs. J. Riley Green, Mgr., Wolfe City, Tex.

Oct. 15—Holsteins. Nebraska Holstein Breeders' Sale. Union Stock Yards Sale Pavilion, So. Omaha. Dwight Williams, Bee Bldg., Omaha, Neb.

Oct. 16—Jerseys. Texas Jersey Cattle Club Consignment Sale at Sherman, Texas.—Mrs. J. Riley Green, Wolfe City, Sale Mgr.

Oct. 17—Holsteins and Guernseys. Eighth Semi-annual Central Wisconsin Breeders' Ass'n Sale at Marshfield, Wis. W. W. Clark, Grand Rapids, Wis., Mgr.

Oct. 22-23—Holsteins. Lake Mills Holstein Breeders' Semi-Annual Consignment Sale, Lake Mills, Wis. F. H. Everson, Manager.

Oct. 26—Jerseys. Texas Jersey Cattle Club Sale at Dallas, Tex. Mrs. J. Riley Green, Mgr., Wolfe City, Tex.

Nov. 12-13—Holsteins. Waukesha County Holstein Breeders' Semi-annual Sale. Waukesha, Wis. W. L. Baird, Sec.

Nov. 14—Jerseys. Texas Jersey Cattle Club Sale at Waco, Texas. Mrs. J. Riley Green, Mgr., Wolfe City, Tex.

Dec. 10—Holsteins. Gormley Bros. Dispersion Sale. Jefferson, Wis.

Shall Number of Cream Buying Stations be Limited

Limitation of the number of cream buying stations in localities where there are creameries to take care of the output is asked in the following open letter of George J. Weigle, Dairy and Food Commissioner of Wisconsin, to Mr. Swenson, Food Administrator for Wisconsin:

"Since it is the policy of Wisconsin's Food Administration to eliminate wasteful practices and to promote the conservation of foods as well as efficiency in our industries, I wish to call your attention to a matter, which, I believe, should be given your consideration.

"I refer to the establishment of numerous cream buying stations in localities where there are already creameries and perhaps one cream buying station to take care of the cream produced in such communities. It is my opinion that to cut down the number of such stations would serve to conserve much dairy produce that is now wasted or rendered of such poor quality that it is a detriment to the reputation of Wisconsin as a dairy state.

"Many cream stations, by purchasing cream that is old, stale, and of poor quality, and which has perhaps been refused at the creameries, encourage the production of such cream. In other instances cream that is of good quality when received is often shipped long distances and when received at churning plants is of very inferior quality. The butter made from such cream is far below the standard which Wisconsin should maintain. Often times cream that is shipped long distances foams and overflows the cans and this waste is a total loss which in all probability falls upon the producer.

"Perhaps a more important phase of the question is from the viewpoint of transportation. The railroads of the country are now, and will be for some time to come, taxed to their capacity in handling material needed to successfully prosecute the war, and the transportation and labor of hauling thousands of pounds of cream that could be made into a better quality of butter by local creameries, seems a waste that should be eliminated.

"In the less thickly populated districts of Northern Wisconsin the cream buying station has its place. It is the only direct method that can be employed to give the beginner in dairying an opportunity to exchange the produce from his dairy and obtain needed cash. There are, however, localities in which the cream buying station is a distinct detriment to the quality of the butter, because it is operated in cities and towns where a well established creamery is located. In other localities these stations are detrimental to the progress of the dairy industry because they divide the product of the community and make it difficult for the local factory to exist. The cost of manufacturing butter from only one-half of the butterfat of the community is nearly as large as if all of it were handled; hence a few patrons carry the burden. We find cream stations in operation in towns where creameries are established; these creameries are struggling to exist on account of lack of cream and the quality suffers because the cream stations will accept a product that is turned down at the creameries. An example of such a situation may be seen in that portion of the state from Prairie du Chien to Hudson. In some places there are two or more cream buying stations and one creamery, when the creamery could handle the entire output of the community at less cost to the dairymen.

"A number of stations are only temporary and not always located in a suitable place, many times in old barns, shacks, etc. They are often in charge of men who do not fully realize the importance of accuracy in the operation of the Babcock test and the proper methods of handling cream. Since local boards of health have charge of the licensing of these stations, there is no uniform system governing their control, and poor sanitary conditions result.

"North Dakota has taken action to limit the number of cream buying stations, the order becoming effective August 1st. The regulation provides for the centralization of cream buying in North Dakota, as a war measure for the conservation of man power to enable the best possible utilization of all dairy products and to insure a good and permanent market for the milk and cream of the dairymen.

"The Minnesota Dairy and Food Commissioner is taking action along similar lines.

"Since our success in prosecuting the war depends largely upon food, man-power, and transportation, the elimination of waste wherever possible seems to be our duty. I therefore ask that you consider the matter of taking action toward eliminating unnecessary cream buying agencies, cutting down the number of st stations in localities where they a non-essential and preventing th establishment in localities where th are creameries to efficiently take ca of the output."

Mr. Weigle also writes us that t Wisconsin Dairy and Food Depa ment would be glad to receive any formation regarding establishment cream buying stations and the ma ner in which they are conducted.

Breed Days at the National Dairy Show

To our friends of the dairy wor who desire to mingle with their f lows in the great Annual Natio Show Yard event, the following p gram will be of considerable intere that plans may be made for a p grimage to Columbus on the days b suited for the occasion.

Monday, October 14th, is Ayrsh and Brown Swiss Day.

Tuesday, October 15th, is Jers Day.

Wednesday, October 16th, Guernsey Day.

Thursday October 17th, is Holst Day.

The International Milk Deale Convention is October 14th and 15

The National Ice Cream Manuf turers' Convention is October 1 and 18th.

The American Dairy Science As ciation and other conventions of tional and local import will be sch uled later.

There is also to be a very extens governmental lecture and demonst tion program as well as exhibit wh will incorporate many local conv tions.—NATIONAL DAIRY ASSOCIATI

Value of Kafir and Cane Silage

The Kansas farmer is fortunate having at his disposal three comm crops—corn, kafir, and cane—any which will make good silage. Feed tests with dairy cattle by the Da Department of the Kansas State A ricultural College covering a per of three years have produced very vorable results with kafir and ca silage. Corn silage was found to slightly superior to kafir, and ka slightly superior to cane, pound pound, but when tonnage yield a the certainty of getting a crop w considered, both the cane and the k fir ranked higher than corn. Cov ing a three-year period on bott land at the College Farm the follo ing yields in silage have been tained: Corn, 11.88 tons per ac kafir, 11.8 tons; and cane, 18 t per acre. Basing estimates on th tests the amount of milk produ from the above yields per acre wo be corn, 22,000 pounds; kafir, 21,9 pounds; cane, 30,000 pounds. more than half the counties of K sas a greater yield of kafir and ca can be obtained with greater certa ty than with corn. Manifestly crop should be used which will turn the greatest tonnage.—Kan State Council of Defense.

The Calves' Creed

We believe in milk, the life-giv maker of muscle and bone.

And in sanitation, the guarantee our safety; insisted on by the ca ful dairyman, neglected by the sl gard; slandered, maligned, slurr it has been defamed, is now appre ated, and shall come to be recogni as the mainstay of dairymen.

We believe in pure water; plen of common salt; abundance of h and grain; the cleansing of bucke the disinfection of pens; fresh a and sunlight.

Iowa. A. C. MCCANDLISH

·on's New York Dairy Notes

HOARD'S DAIRYMAN:—The August ɜt situation in the New York milk .tters has, perhaps, been less excit- ; and tense than for the previous nths of the year, with a certain v exceptions. The surplusage, it is ıe, has kept up well for the most of ly, but indications on this line have ıerally pointed to a lessening of ıteness. July for the most part was cool month, and until we get rmer weather it is difficult to elim- ıte all surplus. However, there has ɜn much less storing of cream and lk in refrigeration than in former ars, and when the hot weather of e July came on it was surprising w quickly New York City cried for thousand cans of milk or more in ɔess of the visible supply.

The Federal Milk Commission has ıctically gone out of business so · as farmers are concerned. One lk dealing concern after another ved notice, as they had a right to , that after thirty days they would thdraw from the findings of the nmission, until by July first the irymen's League found itself un- le to meet a sufficient number of alers to enable it to do business der the commission, and so was liged to withdraw also. This left ɜ League free to make prices for ıger periods than the month as has ɜn the custom of the commission d it announced prices for August d September, leaving the way open · making prices for the usual six nths' period commencing with Oc- ɔer. The price for August as an- unced soon after the twentieth of ly was $2.70 for three per cent lk at 150 miles from New York y and for September the price was .de $2.90 a hundred pounds, under ɜ same conditions.

Dealers generally agreed to the ce and the August first situation ɜmed reasonably clear but for a v exceptions. These, so far as I am are, are operators of condensing evaporating plants. As a guess we y say that the condensing business this country is likely to be trans- red largely to territory where milk n be produced cheaper than in Cen- ıl and Eastern New York. This ter- ory would seem to be best suited the production of milk for the ıde in fluid milk in the cities and lages of the state and adjacent ter- ory. It is no matter of surprise ɜn that some of these plants are ɜsing down, and are even transfer- ıg their equipment to other terri- y. It is in these localities where ɔuble is being experienced in the ɜposition of milk by the farmers. In me cases other dealers are taking this milk.

Farmers' co-operatives are increas- g in number with some little speed, t I cannot see that this is, for the ɔst part, proceeding more rapidly ɜn the occasion demands. It is a ıtter of some surprise that the big lk concerns seem to be somewhat endly to this activity, especially ɜere the farmers purchase the ınts of these dealers. It is a com- ɜte change of attitude it seems to ɜ. The dealers are in several cases ntracting with the farmers to op- ate the plants for the farmers or rchase the plant from them after has been pasteurized and cooled. this it is proposed to pay enough to ow the operators some profit. This s not as yet gone on very far and is too early to say just how far it ll proceed or how satisfactory it ll be.

While weather conditions deter- ne to a very marked extent the de- ınd for milk, there is undoubtedly ıs disposition on the part of con- mers to balk at a somewhat higher ice for retail milk than was the se a year or even six months ago. The city man appears to be becoming accustomed to higher prices for milk just as the farmer is getting accustomed to higher feed prices. The weather factor, however, still indicates that it is as a beverage that the city residents want milk rather than as a food and a vitalizer. Evidently the campaign of education relative to the use of milk has not gone far enough. It is the food value of milk that needs emphasis, its importance for growing children particularly, while not neglecting its value to the adult.

The demand for cows from dealers is considerable. It has seemed to me that rather more sales are being made than usual, but it is pretty difficult to say positively if this is true. Milk prices and conditions have tended to provoke considerable discussion in relation to sales, but the real selling is another matter and may not be rapid. The shortage of labor on farms is growing, although there seems to be some of it left for us yet. More milking machines are going in and lines of labor on farms are being changed a little. There may be some cows sold because of labor shortage, but not a large number at present. Feeds are a little higher than a year ago, but not greatly so. There is a difference of opinion as to what they will be next winter. The hay crop is less than a year ago, but may be equal to the needs of the coming winter. Less hay is being carried over than was the case last year because there has been some chance to sell. Possibly more has been sold than was best, but I am not looking for hay shortage to seriously change the number of cows kept. Corn is not looking well, but there is still a chance for further improvement. Many silos have been filled or partly filled with clover or grass. By doing this it has been possible to continue the harvest during catching weather. This method has been followed to some extent for two or three years and is spoken of with favor. There is much hay to cut on the first of August, but probably not so much as on the same date a year ago.

As August worries along we are experiencing a drouth. This is a help to selling milk and making hay, but it is shortening the springs and the streams. A prolonged drought would be harmful, but not so much so as earlier in the season.

There are some interesting tilts between local leagues and certain of the milk dealers, but an account of these may be given in another communication. It is in order to say that farmers are holding to the organization well and in most cases the honors belong to them. There are still battles to be won, but the more intelligent dealers are tending toward co-operation with farmers rather than antagonizing them.

New York. H. H. LYON.

It is estimated by the Wisconsin College of Agriculture that there were 10,000 silos built in Wisconsin last year, making for that state a total of 70,000. While Wisconsin claims more silos than any other state, yet this number feeds only half her cow population. There is satisfaction in the fact that the silos are gaining on the cows, but there is still room for further improvement and this year should see a greater gain.

Testing for tuberculosis is on the increase in Wisconsin. In 1915 the Wisconsin College of Agriculture supplied the state veterinarian with 51,300 doses, in 1916 it supplied 77,500 doses, while in 1917 it supplied 106,250 doses, over 37 per cent increase over the high figure for the previous year. In addition to the tests with this tuberculin, there were, perhaps, fully as many more made with that produced by commercial concerns.

Dairy Authorities Prove Sharples Claims

Sharples Skims Clean at Three Speeds —Thickness of Cream Not Affected

Dairymen now using Sharples Suction-Feed Cream Separator need no further evidence of its superiority, but for the benefit of those farmers who are as yet using fixed-feed separators we give below the result of tests recently made in the presence of dairy authorities and farmers.

Participating in the tests were Professors R. A. Lamson' Purdue University, O. Erf and R. B. Stoltz of Ohio State University J. J. Hooper of Kentucky University, J. A. Gamble of Maryland Agricultural College, G. C. White of Connecticut Agricultural College, W. M. Regan, of New Jersey Agricultural College E. L. Anthony of Penn. State College, A. D. Cromwell of Penn State Normal, and editors from leading agricultural publications.

A committee was requested to go into one of the warehouses and pick at random a Sharples Separator already boxed for shipment. A No. 4 Sharples Suction-Feed Cream Separator, Serial No. 18,441,291, was selected. This separator was then unpacked and set up at the Greystone dairy farm near West Chester, Pa.

The purpose of this test was to make a trial of the Sharples at varying speeds under *actual farm conditions*, which could be duplicated by the average American dairyman.

Here is the report, signed by Prof. R. A. Lamson, Purdue University, Lafayette, Ind., who supervised these official tests.

Tests of No. 4 Sharples Suction-Feed SEPARATOR

Serial No. 18,441,291; taken from stock June 19, 1918.

SPEED Rev. of handle per minute	SKIM MILK TEST (Per cent. of Butterfat in Skim Milk)	CREAM TEST (Per cent. of Butterfat)
38	.01%	22½%
45	.01%	22½%
52	.01½%	20½%
(Note the changes in speed)	(Merely a trace, regardless of speed)	(Note that cream did not get thicker at increased speed)

We will be pleased to send copy of the full details of these remarkable tests to any dairyman who is interested.

SHARPLES
SUCTION-FEED
CREAM SEPARATOR

The above tests prove conclusively that the farmer who invests in a Sharples is certain to get *all* the butterfat regardless of the speed of turning. 95% of separators are turned too slowly, causing a loss of 80,000,000 lbs. of butter in U. S. yearly. The universal use of Sharples would save all of it.

EDITORIAL COMMENT

THE front cover page of the Guernsey Breeders' Journal for August first contains an illustration of a child leading a lamb and a mature bull. The title under the illustration is: "And a little child shall lead them". We shudder when we see a child leading a bull, for we know how treacherous he is. Undoubtedly this particular child was adequately protected and the subject of the picture was not to teach a practical lesson. But even this is objectionable to us, for it has a tendency to cause carelessness in handling the bull, and not one can be trusted for a moment.

THE large demand for alfalfa hay has advanced its price considerably the past two or three weeks. Those who have alfalfa hay for sale have been harvesting and threshing and comparatively little alfalfa is being baled and shipped. Further, it is a little early to bale alfalfa, unless it was very well cured before stacking.

The situation has unsettled the market for alfalfa, and made conditions rather bad for both shipper and buyer. It is held by those in position to know the facts governing the alfalfa market that two or three weeks from now will be a better time to buy baled alfalfa hay. These men expect the price to be a little lower and few, if any, are looking for a higher price.

WORK OR FIGHT

The present business of the United States is war. Uncle Sam is the manager of this great enterprise and his employees are the citizens of the United States. It is a business none of us like, but circumstances forced us to enter it, and we are going to stay by the job until victory is ours. In view of this we believe provision should be made for extending the selective draft so that every able bodied person in the United States could be used where he would render the most effective service. Uncle Sam should have the same opportunity for directing his help as is given to a manager of any other industry. It is his business to say whether a man shall remain on the farm, make munitions of war, help guide the destinies of state, drive an ambulance, work in factories, build ships, or fight.

If the selective draft were extended to reach men between the ages of 20 and 60 it would increase our fighting power to a large extent and that is what we need. No provision should be made for exemption, but provide the questionnaire so that exemption boards may gather all the facts concerning each person. Each person then should be classified according to his circumstances and placed in the service where he would do the most good.

The farmer is doing his full share and rendering an all important service, but there are men in every city who are contributing little or nothing to the winning of the war and these men of all ages should be called upon to do that which they are able to do. The sooner every able bodied citizen is engaged in some work necessary to winning the war, the sooner the horrible job will be finished. The services of all will mean the saving of our boys over there, and this is by no means an unworthy object. Since the United States is in this war, let us make the most effective fighting nation the world has ever seen.

IMPORTANT FARMERS' MEETING

The Federal Board of Farm Organizations has called a meeting of farmers to be held in Washington, D. C., August 27th, 28th, and 29th. Mr. Charles Lyman, secretary, writes regarding this meeting as follows: "The supreme object of this meeting is to plan how farmers can best serve in this world crisis; and how, in spite of serious shortage of labor, feeds, fertilizers, and, in many cases, inadequate credit facilities and assurances of receiving the cost of production for growing crops, they can increase production of food this coming year."

This is a high purpose, and should lead to a good attendance of the best thinking farmers in the country. It is just as important that the farmers of this country conduct their work on an efficient and comprehensive plan as for the fighting men to be well organized and trained for their service. Food, we are told, will win the war. Bearing this injunction in mind will bring us to the full realization of our responsibilities, and should lead us to appreciate thoroughly our sacred duty to our country and to our boys "over there".

The meeting has other objects, for Mr. Lyman says: "Two of the subjects to be discussed at the meeting are: 'The Farmer At the Peace Table' and 'After the War Readjustments Affecting Farmers'. This war has brought about tremendous changes in all industries and agriculture is no exception. Our condition in everything is abnormal, because everything is being operated upon a war basis. We are putting up with laws and regulations that we would not tolerate in times of peace, because we believe that is the way to win the war.

We are not going to return to the old business relationships as they existed before the war. Some of the things put into practice now for greater efficiency will continue, but some things brought forth for war purposes must necessarily pass into oblivion in times of peace. This meeting is called for the purpose of discussing matters of vital interest to the farmers and to lay plans to carry the agricultural industry successfully through the period of readjustment.

A DISHEARTENING PROSPECT

A few years ago we were visiting a breeder of pure-bred dairy cattle and noted the splendid genius shown by the man in the fine array of barns and stables as well as the appearance of his herd. The farm also was in a most excellent shape and the crops were fine. We complimented our friend on the work of his brain and hands and told him how much good it did us to look at so enticing a picture of farm life. He thanked us for the compliment and said:

"I have tried to carry out my ideals of what a farm should be. In all this I have been helped very greatly by the reading of Hoard's Dairyman and other well conducted farm papers. In many instances they have shown the way to what I wanted to produce. I have made money but what is better I have made a bigger man of myself than what I was when I first began. Associating with pure-bred cattle and with the breeders of such cattle puts a man ahead faster than he may know.

"I have three boys but not one of them has any ambition to keep up and carry on his father's work. It makes me sad to realize that when I am gone this splendid farm will fall into the hands of strangers and go into decay. If I had built up a manufacturing plant very likely my boys would have the same ambition for the business as their father left it but it seems to be different with a farm."

We asked our friend if he had taken any pains when his boys were at an early age to interest them in the farm idea by giving them a good pure-bred heifer which should with her offspring be their especial property. He confessed that he had not done this. Had he done so we believe it would have changed the ideals and purposes of those boys and enabled them to see the old home farm in its true light. It really is a discouraging thought to a progressive, forward-looking farmer to realize that his children do not share in his most worthy ambitions to make as much as possible of the life of a farmer. But it is our observation that many a good farmer has not proved a wise father in training his boys to follow in his footsteps.

LIMITING CREAM STATIONS

Dairy and Food Commissioners Weigle of Wisconsin and Sorenson of Minnesota have recommended to the Food Administrators of these states that cream buying stations be limited. They point out the waste of time in having one or more cream buying stations in a town where there is a local creamery, how these institutions encourage the production of a low quality of cream, and the difficulties they enforce upon the local creamery.

We agree with these commissioners that there is no necessity of a cream buying station in a town where there is a local creamery already properly serving the producers of milk, and in a town where there is no creamery there is no excuse for more than one properly conducted cream station. We also know that the average cream buying station encourages a lower quality of cream, because it often accepts cream refused by the local creamery.

It is our firm conviction that farmers who sell cream to cream stations where there is a local creamery are following a shortsighted business policy. Many times have the farmers destroyed the local creamery and then have been forced to sell their cream below market price. Such instances have brought forth much complaint by the farmers, but nobody was to blame for the situation except themselves. They had played into the hand of the competitor of the local creamery and killed it.

While we recognize the evils of many cream stations and the wisdom of supporting the local creamery, as do Commissioners Sorenson and Weigle, yet we do not agree with them as to the remedy. As a war measure their remedy may be accepted and prove effective. But in times of peace we consider their remedy worse than the evil which they are trying to correct. Who is going to determine which one of the several cream buying stations shall continue in business? Who has the right to direct the farmer to sell his cream to a creamery instead of a cream station? These are questions that must be answered. What could be more autocratic than a government directing the producer to sell their products to certain concerns or limiting the number of concerns that may enter a certain business? The principles of control of creameries and cream stations recommended by Commissioners Weigle and Sorenson would not only apply to these institutions but to factories, shop keepers, store keepers, etc. At Hutchinson, Minnesota, there are two creameries, one a farmers' co-operative creamery, and the other a private creamery. Both have done well. Who will have the authority to say which one of these creameries shall close, or that both shall be permitted to run?

It is the duty of dairy and food commissioners to force food producers to provide wholesome foods, to direct how this shall be done, and to see that foods are properly labeled. It is going too far when these men desire to limit the number of institutions providing foods for the market. As a war measure, to save food and transportation, it might be well to grant some one the arbitrary power of limiting the number of cream stations. But in times of peace this principle of government would not be tolerated.

ACCREDITED HERDS

Through the efforts of the Bureau of Animal Industry, the United States Live Stock Sanitary Board, and state governments, accredited herds are being established. On page 132 of this week's issue will be found an article entitled "Wisconsin Accredited Herds Transferred", and it gives the regulations providing for the establishment of accredited herds. Recently we published a list of the accredited herds in Wisconsin and would willingly publish a list from every state. So far, only a few states have established accredited herds, but it is only a matter of time when every state will have many herds on this list.

It is to the advantage of every breeder to so handle his herd that the state will put it upon the accredited list. It will require but a few years to get all pure-bred herds on this list, and with good management the cost will not be unreasonable. The profit and advantages to be gained by having a tuberculosis free herd, and so recognized by both the federal and state governments, will more than pay the expense of putting a herd upon the accredited list.

The breeder must ever bear in mind that the purchaser of pure-breds is growing more exacting regarding tuberculosis. This is recognized by the leading breeders and sales companies and they are selling animals subject to being returned to them unless they successfully pass the tuberculin test 60 or 90 days after the sale. We must bear in mind, too, that the United States will be called upon to replenish the herds of Europe and that the buyers who come from that country will be very particular about tuberculosis. They will hesitate to purchase animals from a herd containing any tuberculous animals, even though those they select may pass the tuberculin test. In other words, they will want no cattle that have been associated with tuberculous animals or exposed to this disease.

Buyers will pay more for cattle from an accredited herd, because they have the assurance that such herds are not only free from tuberculosis, but every avenue of infection has been checked as far as possible. Breeders who have not considered placing their cattle on the accredited list should give serious consideration to its advantages.

Ice or Mechanical Refrigeration

We want to know whether we should put in a refrigerating plant in preference to buying ice in Savannah, two miles from here, present price 33⅓ cents per hundred pounds. Before the war ice was selling at 15 cents. If you would advise putting in this plant, then would you suggest that we get a larger boiler than would be required for sterilization purposes only, or would you use a boiler only large enough to take care of sterilization pur-

oses? If you think we should increase the boiler or this purpose, then, what size engine should we se in connection with it? Would a two-ton refrigrating plant be large enough to take care of the ooling of the milk from 150 to 200 cows? We have 12 H. P. stationary gasoline engine used for cutting silage and grinding feed about 150 feet from ilk house. Is there some way of utilizing this engine for our power for milk house and refrigerator?

Savannah, Ga. L. F. R.

Professor L. M. Schindler of the Wisconsin College of Agriculture gives us the following reply to he above inquiry:

It is doubtful whether a small refrigeration lant would prove more economical under present onditions than the use of ice at 33⅓ cents per undred pounds. The cost of refrigeration appaatus and ammonia has experienced a considerable ncrease due to war conditions. Allowing in addiion for the increased cost of fuel and a fair perentage for depreciation, would in most cases make his method of refrigeration more costly than ice t the figure suggested.

A two-ton refrigeration plant will cool the milk f 200 cows. A ten-horse power boiler should be sed for power to operate the plant and to furnish team for sterilization purposes. A five-horse pow-r steam engine is usually recommended for a lant of this size. Electric equipment might be intalled to operate the refrigeration plant, using the welve horse power gasoline engine now in use for eed grinding. As steam boilers, however, must be sed for sterilization, it would be much more conenient to operate the refrigeration plant by team.

Curing Clover Hay

Please give me the various methods of curing lover hay.

Kent, O. I. C.

There are nearly as many different ways of curng clover as there are men, but there are, of ourse, well defined practices that are more or less enerally accepted. Concerning the best method f curing clover, Joe Wing once said:

"There are, however, a thousand contingencies f weather that will interfere with any well devised rogram of clover hay making in the land of sumer showers. One must be a schemer, ready to ake advantage of sun and wind, prompt to act hen sudden dark and portentous clouds roll up in he West, patient and unstinting in cocking, openg out to dry, and cocking again."

Something over a year ago, Professor Andrew oss gave us the following very interesting discuson of various methods of curing alfalfa hay:

"Clover for hay should be cut as soon as the first lossoms begin to turn brown. If a large amount to be cut with a small crew, one should begin ven earlier to prevent the last of the crop from etting too ripe before it is cut. The general tenency, among those not familiar with the method f making clover hay, seems to be to let it become o ripe before cutting. The longer any hay crop left uncut after its bloom has reached the proper age, the more indigestible it becomes. The only ondition that should be permitted to delay the utting beyond this point is prevailing bad eather.

"The mower should be started in the evening beore the dew has fallen or in the forenoon as soon s the dew is off; and it is not wise to cut down too uch at one time.

"Clover hay should be cured in the shade, and ot exposed to the hot sun unless it is frequently rned. The sun quickly dries the thin leaves, using them to become brittle and easily lost. The aves are the most valuable part of the hay. The ying of the leaves also closes the natural annel for the moisture to get out of the stems. fter the clover has been cut, it should be turned ith a tedder, side-delivery rake, or hay rake, as on as the leaves in the upper part of the swath e thoroughly wilted. The object should be to ep the hay loose in the swath or windrow, that e wind may have a free circulation through it, d to keep it from exposure to the hot sun as far possible. Before the leaves and stems become y and stiff, the hay should be raked into windws.

"If hay is cut in the forenoon, and the crop is ot too heavy, good weather will permit it to be t into the windrow by night. If it looks like in when it is being raked, it should be put into ell-made cocks, and, if possible, covered with oth covers. If the weather appears likely to conue good, the clover should be left in the windw over night and turned once or twice the following forenoon.

"In good weather it should then be fit for the stack or the mow the second afternoon. If the weather is such that the hay is not fit to stack, but will still go into the cock, it should be put into good sized cocks and left for some time.

"Clover cured in the windrow or in the cock does not become dry and stiff as does that exposed to the sun in the swath for a day or two. The stems are soft and pliable, and they form a cock of hay that will shed much more water than when they are cured in the swath by exposure to the hot sun.

"The fact that clover stems are quite large and succulent frequently causes this hay to be left longer to cure than is really necessary. It is surprising how much sap may be present in clover hay when stacked, and still have the hay come out in excellent condition. A little experience will enable one to determine the degree to which clover must be cured before it is stored. Overcured hay is neither as palatable nor as digestible as hay that is properly cured.

"Good clover hay is so valuable and necessary on the farm that no effort should be spared to cure it in the best possible manner. Cock covers from four to five feet square, made of duck or muslin, are practical to use in protecting hay from sun and rain. They can be used several times each year and will last several years if given proper care. This will reduce the cost per ton to a relatively small amount, ranging from 25 to 50 cents per ton for the covers, and the additional labor of handling them.

"Where clover is put into the cock, it is advisable to open up the cocks and permit them to air a short time before taking them to the stack or mow.

"If the hay is put into a stack, the stack should be started upon a bottom of poles, brush, straw, or old hay. Where it is placed directly on the ground there is bound to be more or less spoiled hay in the bottom. Clover hay does not shed water, and it is advisable to top out clover stacks with rather green timothy, prairie, or slough hay, putting on enough hangers to hold the top in place.

"There are a few variations in the methods of making good clover hay, but the real secret, no matter what the methods, is to cut it at the proper time and cure it "in the shade" as much as possible, being careful to avoid a hasty drying up of the leaves and overcuring. Properly cured clover hay will sweat in either the stack or the mow, but unless it is unevenly packed and loose, no alarm need be felt if it gets warm."

How to Increase Clover

Upon our 160-acre dairy farm we have six twenty-acre fields, lying on either side of a lane, upon which we desire to practice the regular rotation: corn, oats, and clover, forty acres to every crop. We have been seven years trying to improve the land, and the corn and the oats show results, but the clover we cannot depend upon. Why is this? We have tried it under rye, wheat, and oats. We have applied limestone.

If we ever can get it growing surely and strongly, will we be better off to let it stand upon any one field for two years, or one only? Also, which is the better farm practice, to pasture it in the fall before the spring when we are going to turn it over, or to let it grow undisturbed? The land is level, partly a sandy loam, partly a clay loam. Will we succeed? We are trusting Hoard's Dairyman, but the way seems long and we are short of hay, and have to rent pasture.

Illinois. A CITY FARMER.

We cannot tell of any short and rosy path to success in growing clover. Owing to conditions of weather, or for some other unexpected cause, nearly every farmer has years when his clover will not make a good crop. However, if the proper farm practices have been followed, the clover seeded on well drained soil and on ground that contains a proper amount of the necessary fertilizing constituents, there is no reason why success should not generally follow. Just what is the trouble in this particular case, we are unable to say.

If the grain and corn does well on these fields, then clover should also do well providing the soil is not acid. That the soil is not acid would be indicated if it does not show any improvement when limestone is applied at the rate of two tons or more per acre.

The soil may be deficient in phosphorus, which is quite generally true of the prairie soils of Illinois. If so, the application of 1,000 lbs. of rock phosphate in connection with a green manure crop or stable manure should produce good results. If quicker returns are desired, the application of 250 lbs. or more of acid phosphate per acre should be productive of excellent results.

Whether the clover is to stand one or two years and whether it should be pastured in the fall depends largely upon what it is desired to accomplish. In the ordinary farm rotation, it is desirable to let clover stand for two years, providing it makes a good growth. If the clover is to be used as a green manure crop, then it is not desirable to pasture it in the fall, particularly where the ground is to be fall plowed. An attempt should be made to plow under a goodly portion of the green crop if the best results are to be secured. In order to bring their land into better growing condition at as early a date as possible, many farmers either cut their clover for hay the first year only or in some cases cut it but once the first year and plow under all the subsequent growth. Pasturing in the fall gives excellent feed for the cows, but if the ground is to be plowed under that fall or early in the spring, it will not, of course, work to the advantage of the soil itself. However, if the field is given sufficient time to recuperate and is not pastured too closely, it is quite possible that the feed afforded the cows will more than offset such damage as may possibly be done to the crop as a green manure.

Alfalfa Turns Yellow

The first crop of alfalfa we cut this year was very plentiful, good, and healthy. Ever since that time, however, we have had a severe dry spell. Gradually the alfalfa plants turned yellow and began to dry, and our second cutting was just about one-third as much as the first. There is just small evidences of the alfalfa plants coming up again.

What we desire to know is, do you think that the drying of the alfalfa is due entirely to lack of rain or is there a possibility of a disease having gripped the plant? Furthermore, do you believe that with the coming of rain the plants will again thrive?

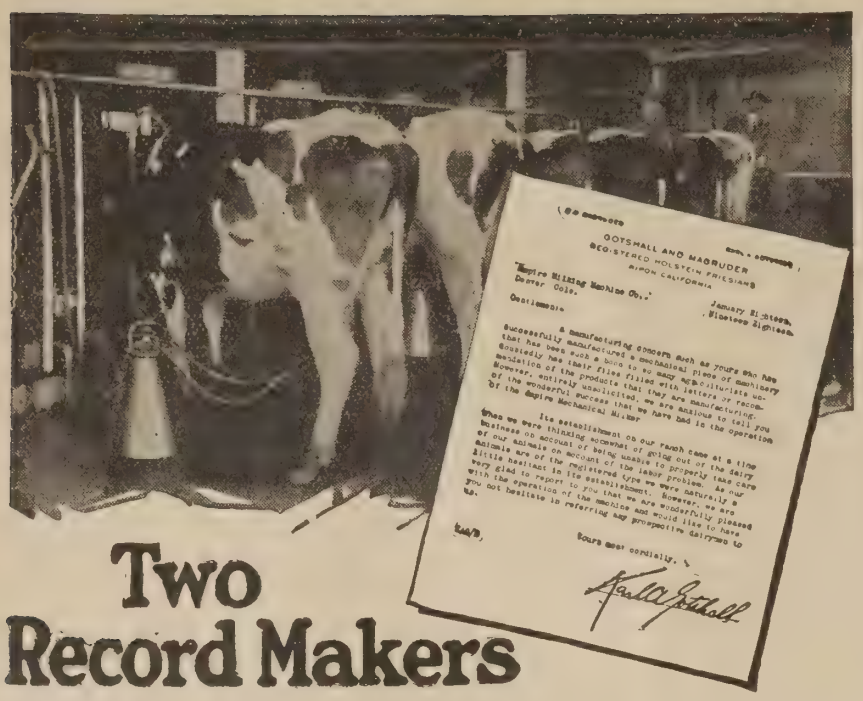
St. Louis, Mo. A. F.

We have experienced the same trouble in certain of our own alfalfa fields, and we have not yet been able to satisfactorily explain it. We know, however, that the third crop is coming along in somewhat better condition but whether there has been a loss of vitality in the plant, or whether some fungus disease has attacked it, we are unable to say.

It is reported in several cases that cutting alfalfa before the shoots commence to start will sometimes cause this trouble. Also cutting after the shoots have got too long will bring about similar difficulties. This past winter we talked with Mr. Readheimer of Illinois and he informed us that they have noted in several districts of that state that alfalfa last summer failed to make a good growth and the shoots did not start. These farmers who cut the crop as soon as the growth ceased secured a very good crop, while those who waited for the shoots to appear were quite grievously disappointed in the succeeding cutting. It was his contention that while under normal conditions the appearance of the shoots indicated the time to cut, yet there were occasions when it could not be relied upon. He felt that the alfalfa should be cut as soon as it is noted that a certain crop has ceased to make further growth.

We have not heard of any alfalfa disease or parasite that has attacked the alfalfa in Missouri. Further west, of course, they have the alfalfa weevil which is doing a considerable amount of damage and which would bring about results similar to those described. We doubt whether this is the trouble, however. We anticipate that with the coming of rain the field will come on in good shape. This statement is, of course, predicted on the assumption that the field is not acid and it contains a proper amount of fertility.

Last year we had a dry spell following the second cutting the latter part of July, followed by a pest of grasshoppers that kept the new growth eaten off until fall. These fields did not fully recuperate with the fall rains and what damage had not been done before was fully compensated for by the freezing weather. If any of our readers can give further information, we would be pleased to pass it on to others who may be similarly situated.



Killing Flies in Barn

I want to get rid of flies inside dairy barn. What shall I mix with milk to kill them?

Newport News, Va. R. A. B.

One of the most effective of fly poisons may be made of a mixture of formalin and milk and water. The proportions of the mixture should be approximately one teaspoonful of commercial formalin to one teacupful of water or milk. Milk is to be preferred.

Another poison which has given very good success is made by dissolving one dram of bichromate of potash in two ounces of water; add a little sugar to the solution. This poison is not dangerous to human life and is very efficient.

Two Record Makers

THE cow at the extreme left in the above picture is the new California State champion two-year-old Holstein, K. P. Tola Joe, who recently made the fine record of 27.15 pounds of butter in seven days, from 459.1 pounds of milk, testing 4.73 per cent fat. Like many other famous record cows of all breeds, K. P. Tola Joe is milked by an Empire Milking Machine.

These two record makers, the Empire Milker and K. P. Tola Joe, have succeeded in breaking all State records for two-year-old milk production among Holsteins. Empire Milking Machines will help you to increase the production of your cows; they will safeguard the health of your cows and solve your labor problem; they will cut down costs and increase profits. Read what Mr. Karl A. Gotshall, of Gotshall & Magruder, the owners of K. P. Tola Joe, says about the Empire Milking Machine—his letter is reproduced above. Then consider that the following successful dairymen and hundreds of others in the State of California are using Empire Milking Machines with equal success.

F. W. Helm, Fresno; F. W. Kiesel, Sacramento; H. E. Vogel, Fresno; A. W. Morris & Sons, Woodland; Minor & Thornton, Fresno; Millbrae Dairy, Millbrae; M. J. Schoonderwood, Chowchilla; Cotati Company, Cotati; Johnson & Jepson, Ferndale; Ole Oleson, Ferndale; Hopland Stock Farm, Hopland; A. Meister, Sacramento. (Write for a full list of California users.)

You cannot afford not to follow the example of these successful men. We will be glad to send you full information about Empire Milking Machines without obligation to you. Write at once for Catalog No. 31

Association Notes

Greenwood Prairie, Minnesota: Three unprofitable cows were sold last month. Seven members are finding it profitable to supplement pasture with grain. One new milking machine has been installed and another ordered for spring delivery. This makes the total number of machines in the association 11. The price which the creamery has paid for fat varies from 46c to 49½c. Prices per ton for concentrates are: bran, $36 per ton; oats, $40; oil meal, $59; barley, $42.

Burnett County, Wisconsin: Two pure-bred Ayrshire bulls and one Holstein bull have been purchased, also two pure-bred Ayrshire heifers. One four-year-old Holstein bull with high production breeding has been purchased and a large number of pure-bred bulls are being brought in this fall for bull associations. Scrub sires and scrub cows are fast losing favor here. The creamery pays 50c per pound for fat. Bran sells for $29.50 per ton; shorts, $31.00; oats, $70.00; oil meal, $60.00 Hay is not priced here and is very scarce. Feed is hard to buy as little mill feed is on the market. The association plans on buying cottonseed meal, hominy, gluten meal, oil meal, and alfalfa by the carload.

An association picnic was held Saturday, July 27, near Grantsburg in conjunction with the boys' and girls' club meeting. The date was a poor one as it was in haying and harvest time but the attendance of 60 autos made an excellent crowd. The forenoon was devoted to boys' and girls' pig, calf, and potato clubs, and games were played under the guidance of Mr. Cooper, the club leader. The remaining time was taken up with a splendid lecture by Prof. R. M. Washburn of the Minnesota University on the production and the value of dairy products and he brought out plainly the great value of the dairy industry. He also gave a short cow judging demonstration and then placed the cows for a judging contest, the first of the kind held in Burnett County. Bulletins on judging had been distributed the month before by the tester and the interest was keen. About 25 contestants entered and Miss Parnel Larson, a school teacher, won first on the Guernseys, and Clarence Hanson first on the Holsteins. The contestants had to state their reasons for placing the cattle which counted 40 per cent in the contest and many new points were brought out in these discussions that Mr. Washburn never knew existed. Another contest will be held at the local fair and there will be many contestants. Pitching quoits, five-foot races, and a tug of war were the other features of the afternoon. We will have another picnic next year but at a more seasonable date.

Wilson County, Tennessee: In July the creamery paid 44c for fat and retailed butter for 45c. Cottonseed meal sells for $2.70 per hundred pounds; velvet bean meal, $2.25; and wheat bran, $1.70.

Orange, Virginia: The association has finished its second year's work. Milk is now being sold to the Washington, D. C., market for 32c per gallon, a test of 3.5 per cent being required.

Arkansas Valley, Colorado: Our dairy prospects are brighter than they have been since March. The problem of winter feed is being solved by the heavy cuttings of alfalfa and the unusual growth of ensilage corn. This, together with the rapidly advancing price of milk, will put dairying on a boom in our section. In July milk testing 3.5 per cent sold for $2.35 per hundred pounds. The condensery paid 30c per pound fat and in addition $1.25 per hundred pounds milk. The creamery paid 38c per pound fat. Milk retails for 12c and butter for 50c. Alfalfa hay is valued locally at $10.00 per ton; corn silage, $8.00; wet beet pulp, $2.00; corn chop, $67.00; bran, $35.00; shorts, $37.00; and cottonseed meal, $63.00.

Burlington, New Jersey: Two cows have lately been sold from our association as boarders and seven pure-breds have been purchased together with seven grades. There are seven pure-bred bulls in the association and three grades. E. A. Smith had the highest average herd in July with 46 cows which made a total of 21,972.7 lbs. of milk, containing 998.1 lbs. of fat. They produced this milk at a feed cost of $2.09 per hundred pounds.

LaCrosse County, Wisconsin: The association has just completed a very successful year, having nine Register of Merit cows. Frank Wachlin was elected tester to succeed Geo. Scarseth. New officers of the association are W. D. Sandman, president; Mandly Libakken, vice-president; G. W. Vergeront, secretary.

Whitman-Spokane, Washington: In July 3.6 per cent milk sold for $3.12 per hundred pounds. The creamery paid 47c per pound fat. Milk retails for 14c and butter for 55c. Alfalfa hay costs $28.00 per ton; cocoanut meal, $65.00; oat middlings, $35.00; bran and shorts, $33.00; and oil meal, $75.00. The highest average herd in the association for the month of July was that owned at the County Infirmary and included 22 cows which averaged a production of 770 lbs. milk containing 32.5 lbs. fat.

Arkansas Valley, Kansas: One more pure-bred bull has been purchased and a few unprofitable cows have been sold for beef. Market milk testing 3.3 per cent sold here in July for $2.50 to $2.80 per hundred pounds. The condensery paid $2.30 for milk testing 3.5 per cent. The creamery paid 46c for fat. Milk retails for 11c to 12½c and butter for 47c. Alfalfa hay costs $15.00 per ton; silage, $4.00; corn chop, $64.00; bran, $26.00; oil meal, $68.00; cottonseed meal, $68.00; oats, $45.00;

nd pasture $1.50 per cow per month.
Rice and Cedar Lake, Wis.: The gh cow for July was a grade Guern- y owned by Harry Stout. She pro- nced 904.8 lbs. of milk containing 3.8 lbs. of butterfat.

Ames One-Year Dairy Course

HOARD'S DAIRYMAN:—Dairying in his country is beginning to feel the ffect of labor shortage perhaps to a reater extent than any other agri- ltural interest. The women, some f whom realize the situation, have ome to our assistance and today sev- ral women are in charge of local cow st associations. Mrs. H. M. Rochau f Davenport, Iowa, has recently tak- n up official testing work in Iowa nd is, to our knowledge, the first oman in the United States engaged n that work.

A woman should not be considered o be out of place in the dairy. She as a more acute sense of cleanliness han men, and she is reliable, pains- aking, and accurate about her work, hich are just the qualifications de- anded of the one who expects to ake dairying a success. If we enter dairy school in Europe we find hat half or more of the students in ttendance are women. They work in reameries the same as men and us- ally wherever women are employed he creameries are in a sanitary con- ition.

It has been decided that the one- ear dairy course at the Iowa State ollege shall be open to both men nd women. Many women will be eeded for testing work; such can omplete their courses in a shorter ime but those who desire a more com- lete dairy education should take the egular one-year course which covers he following subjects:

First semester: dairy practice, but- ermaking, milk testing, dairy bacte- iology, dairy engineering, breeding nd judging dairy cattle, dairy chem- stry, soils and fertilizing materials.

Second semester: dairy practice, heesemaking, buttermaking, milk esting, factory management, prepa- ation of ice cream and ices, judging airy products, market milk, feeding nd management of dairy cattle, and eneral farm crops production.

The one-year course in dairying ncludes the general work in creamery anufacturing; viz., buttermaking, heesemaking, ice cream making, and arket milk. These branches are op- rated on a commercial basis every ay of the year. The students are re- uired to spend each forenoon in the airy department and carry on this ork under supervision of the depart- ent instructors. The object is to pply the theoretical knowledge ained in the class room to the prac- ical work in the factory. The labora- ory work is very important since it repares students to be buttermakers, e cream makers, cheesemakers, mar- et milk operators, and owners or op- rators of plants.

The men who have formerly taken his course and who have done satis- actory work here have been placed y the dairy department at good sal- ries. The demand for thoroughly ained men who can operate a reamery, cheese factory, ice cream actory, or market milk plant is reater today than ever before and e also believe that there will be lenty of work for women who have eceived such training.

The dairy course referred to begins his year on September 24. Students hould be here to classify from Sep- mber 21 to 23. For further infor- ation address Dairy Department, owa State College, Ames, Iowa.

Iowa. M. MORTENSEN.

The principal dairy states will waste, this winter, 3½ Billion Pounds of Milk

Simply by failing to get it; failing, too, when it would be easy to produce that increase for a world market that demands every possible ounce of food.

Surely this is not the time to overlook any opportunity for increased dairy production and profit. It is no time for waste or neglect. The bending of every effort toward bigger dairy results, for both patriotic and personal reasons, is the duty of every dairy farmer. Here is one way in which the dairy farmers of the principal dairy states could add this winter 3,600,000,000 more pounds of milk. At $3 per cwt. this would mean $108,000,000 more profit.

These are not wild figures. They represent bed-rock facts, and they mean that if all the cows in the principal dairy states were properly watered with James Drinking Cups they would add 3½ billion *more* pounds of milk to this winter's yield—milk that would be worth to the nation as a whole, and to you in part as a producer, at only $3 per hundred, more than a hundred million dollars.

A tidy sum for the dairymen of this country to think about, isn't it? A sum well worth saving in *any* year, but especially so in this period of advancing food prices, increased milk demand and costly feed.

Then there's your own question of labor, and the protection of your herd from disease, to be thought about in this great crisis. James Drinking Cups give each cow clean, safe water that no other cow has had her nose in. They do away with the hard, cold job of herding the cows out to the tank, herding them in again—chopping open the frozen tank.

There are two shortages for you to think about: The world-wide food shortage, and your own pocketbook shortage caused by your cows not getting all the water they want, *when they want it*, at the right temperature, day or night.

They will give more. All they need is the opportunity. James Drinking Cups spell that opportunity. The milk increase of the average cow will *pay for her cup* in 90 days. At the end of that time the account covering the complete installation will be *squared* as a result of increased profit, leaving you the cups for many years of money-making service, either in your present barn or when re-installed in a new one.

Do *your* part toward getting the extra millions which American dairy interests can produce by making milk out of water. Get *your* share of those dollars. It's easy to buy, easy to install and easy to operate James Drinking Cups. We've solved this great watering problem, and solved it *right*—just as we have so many other questions relating to sanitary barn equipment. Write today for booklet, "How to Make More Milk."

Pail Balancing Scale

Direct to You For $2.85

JUST the thing to determine the yield of each cow. Especially popular with cream handlers who weigh the cream as collected at the different farms.

On the dial of this scale is a loose indicator which can be adjusted and set by a thumb screw, at the O mark so as to balance the weight of the pail. Thus, the net weight of the milk is shown.

Two
Record Blanks Furnished Free

with each scale. These blanks contain the record of two milkings a day for one week for 14 cows.

Three Capacities

Plant With These Drills

DRILL-PLANTED fields produce greater yields. Remember that at planting time this year, when every bushel added to your harvest field counts.

The use of **Empire Jr., Hoosier,** or **Kentucky Drills** means not only more grain per acre, but better prices. Drill-planting improves the quality of the grain, for when seed is properly planted, at even depth, and covered as it should be, it comes up all at the same time, grows uniformly, and ripens evenly. Such grain grades high and brings good prices.

The drill that will do the best work for you is in one of these lines. It is handled by some local dealer not far from your farm where you can see it, or you can find out all about it by writing us for drill catalogues. There are drills for planting every kind of grass or grain, with or without fertilizer, in every kind of soil.

The dealer, or the catalogue, will tell you all about feeds, furrow openers, bearings, attachments, etc. All we can tell you here is that you will find just the drill for your work in the **Empire Jr., Hoosier,** or **Kentucky** lines, and that without any trouble or expense on your part beyond the writing of a letter or post card. Why not write it now, before you forget?

Alfalfa Hay Grades

The following are the Kansas City Official rules for grading hay, which rules have been adopted by the National Hay Association, with exception of 'Fancy Alfalfa' which was omitted in National Grades.

Fancy Alfalfa—Shall be pure alfalfa, fine stemmed, bright green color, with clinging foliage, and well baled.

Choice Alfalfa—Shall be reasonably fine, leafy alfalfa, of bright green color, properly cured, sound, sweet and well baled.

No. 1 Alfalfa—Shall be, if coarse, of bright green color, and may contain 1 per cent foreign matter. If of finer stem, being of a medium texture, green in color, but not necessarily as bright as the previously described coarse alfalfa. It may contain 3 per cent of foreign matter. Or it may be of fine stem, heavy clinging foliage, of a dull green color, and may contain 5 per cent foreign matter, sound, sweet, and well baled.

Standard Alfalfa—May be of green color, of coarse or medium texture, and may contain 5 per cent foreign matter. Or it may be of green color, or coarse or medium texture, 20 per cent bleached and 2 per cent foreign matter. Or it may be of greenish cast of fine stem and clinging foliage, and may contain 5 per cent foreign matter. All to be sound, sweet, and well baled.

No. 2 Alfalfa—Shall be of any sound, sweet, and well baled alfalfa, not good enough for standard, and may contain 10 per cent foreign matter.

No. 3 Alfalfa—May contain 25 per cent stack spotted hay, but must be dry, and not contain more than 8 per cent of foreign matter. Or it may be of a greenish color and may contain 50 percent foreign matter. Or it may be set alfalfa and may contain 5 per cent foreign matter. All to be reasonably well baled.

No Grade Alfalfa—Shall include all alfalfa not good enough for No. 3.

Organizing for Feed Defense

(Continued from first page.)

are shipping in the golden grain from the Southwest, paying premiums on wheat and excessive freight charges. The feed situation in the Northwest is "tighter" than in the Southwest, a great and broad demand prevailing, with mills of the spring wheat area having only little feed to offer.

Wheat Feeds Lowest in Price

A study of the market prices and feeding value of feedstuffs brings out the fact that bran and shorts, even at the maximum level, are comparatively lower than possibly any other commodity. Many feedstuffs have soared recently to higher levels, and the indications are for further advances, but bran and shorts are held stationary. It would appear from an analysis of comparative feed prices and feeding values that an enormous demand will continue in markets for bran and shorts.

Because other feeds have moved upward recently there is some agitation among bran and shorts trade interests for an advance in the fixed prices on the offals of mills. Formal appeals have been made for advances. One appeal sent to Washington includes an argument that the mill feeds are about $15 a ton cheaper than they would be worth today on the open markets if there were no price restrictions. Many mills already report that they could easily obtain higher prices for their feeds if they were not prohibited by the government from selling at more than the fixed quotations. But the government is not likely to make changes.

Buyers who pool purchases should not overlook that the federal regulations permit them to obtain carlots at reduced prices as compared with less than carloads or mixed cars. Also, if mills nearest the clubs seeking to buy the feed fail to obtain the quantities desired, it would be well for the dairymen interested to appeal to their country merchants to seek this feed when buying flour, and thus accomodate the milk producers. Also, the vendors of mill feed who are not adhering strictly to the profit limitations of the government should be shunned so that the attractive prices fixed by the government will be available to dairymen.

It is needless to hesitate to draw any conclusion from a study of the bran and shorts trade situation as to what is the wisest policy for war feed buyers to pursue. The writer believes it is the duty of every feed club and all other dairy buyers to purchase heavily and early of this feed, and to stock up for future requirements at every opportunity. A bargain basis prevails. Car shortage may intervene to restrict buying opportunities. There will be a wider use of mill feed than ever because of the low price level, comparatively speaking.

Fixed Prices at Mills

The Cereal Division of the Food Administration has promulgated the following schedule of mill feed prices in carload lots, in bulk, at the mill:

Milling Point	Bran	Mixed Feed	Middlings, Shorts, Red Dog
Chicago	$25.26	$26.51	$27.26
St. Louis	24.46	25.71	26.46
Boston	29.66	31.91	32.66
New York	30.26	31.51	32.26
Philadelphia	29.86	31.11	31.86
Baltimore	29.66	30.91	31.66
Nashville, Tenn.	27.46	28.71	29.46
Atlanta, Ga.	31.06	32.31	33.06
Louisville, Ky.	26.86	28.11	28.86
Durham, N. C.	31.26	32.51	33.26
New Orleans	27.26	28.51	29.26
Galveston	29.76	31.01	31.76
Buffalo, N. Y.	28.16	29.41	30.16
Cleveland, O.	27.76	29.01	29.76
Duluth, Minn.	23.36	24.61	25.36
Minneapolis, Minn.	23.36	24.61	25.36
Grand Fork, N. D.	20.82	22.07	22.82
Great Falls, Mont.	16.67	17.92	18.67
Aberdeen, S. D.	19.95	21.20	21.95
Wichita, Kans.	19.41	20.66	21.41
Fort Worth, Tex.	28.66	29.91	30.66
El Paso, Tex.	31.16	32.41	33.16
Omaha, Neb.	22.26	23.51	24.26
Kansas City, Mo.	22.26	23.51	24.26

As mill feeds are sold almost exclusively in sacks, it is necessary to compute the maximum prices in sacks, and not in bulk. The cost of sacks will run from $5.50 to $6, possibly slightly more, per ton of feed. For instance, in Kansas City, where the maximum price on bran in bulk is $22.26, millers quote $27.90 as the maximum level with sacks added. War feed clubs are safe in adding $6 per ton of feed for sacks to the maximum bulk prices. Also, to find the delivered cost of the feed, it is necessary to add the freight charges from the milking station to the point of destination. In sales of less than carlots, such as a mixed car of flour and feed, millers are permitted to add 50 cents per ton to the maximum price of the feed. When purchases are made from brokers, jobbers, and other rehandlers, additional charges are necessary for the support of these trade facilities. These additional charges are limited to $1.50 per ton.

The small retailers, including some country grocers, and commercial feed manufacturers who use bran and shorts are not so restricted as to the selling prices for these feed articles. The country grocer is not licensed by the Hoover administration, and it is reported that some of them are taking advantage of the relatively cheap prices fixed by the government on bran and shorts, making purchases

and re-selling at big profits. Local food administrators are seeking to guard against this, however. Feed mixers are said to be endeavoring to use a larger quantity of bran and shorts in their products than in normal years because of the fact that they will thus cheapen the cost of their mixtures and increase their profits.

Mill feed prices no longer depend on the market prices for wheat. A year ago, the maximum price of bran was equal to 38 per cent of the cost of the wheat, which made bran worth $32 to $33 per ton in sacks, carlots, basis Kansas City. Also, feeds may be purchased and shipped from any territory, but, of course, the most desirable source of supply is the point nearest the buyer.

Milling Percentages

The extraction regulations in the milling of flour are similar to the control rules of the preceding year, except for the fact that only one grade, 100 per cent flour is produced, the remaining portion of the wheat berry making the offals. Millers cannot use more than 264 pounds of 58-pounds-per-bushel wheat in making 196 pounds of flour. The following table shows the allowable feed extraction:

Test weight of Wheat per bushel	Maximum permissible feed returns per 196 lbs. flour manufactured
58 pounds or heavier	68 pounds
57 " " "	72 "
56 " " "	76 "
55 " " "	80 "
54 " " "	85 "
53 " " "	90 "
52 " " "	96 "
51 " " "	102 "

War feed community purchasing organizations should bear in mind that the prices enumerated are the maximum level at which mills may sell their feed, not the fixed basis. Under keen competition to dispose of offerings, which is hardly possible, even though large quantities of feed will be produced, mills may reduce their prices from the maximum level. However, this is a matter of demand and supply, both influences being controlled by numerous factors. In the demand situation, reference must be made to weather conditions, volume of other feed crops, the comparative scale of prices, and the dairy and general live stock situation. Thus far since the new maximum level became effective, there has been a scramble for bran and shorts, the weather situation, the light linseed meal output indicated, and the higher values ruling for other feeds, resulting in a big demand for bran and other feeds produced by the flour mills.

Fodder Substitute in Foreign Countries

(Continued from page 132)

acorns are equal to 5¼ pints of oats. Acorn feeding should be suspended for a week after continuous use for a month. Horses and cattle should have raw acorn crushed and the husks removed. For pigs, the acorns should be crushed into a coarse meal and mixed with cooked potatoes, or cooked with potatoes.

Horse chestnuts are especially good for sheep, one pound replacing three pounds of fodder beets. The maximum ration, however, should be two pounds for sheep. Cattle may receive from four to six pounds for fattening purposes. The chestnuts should be cooked or cut up and well mixed with other food. Pigs refuse them in all forms and they are poisonous to poultry, ducks, and game. In Austria all horse chestnuts and acorns were requisitioned last fall.

Heather has been used extensively in Germany since 1916. It is mown, then chopped, and dried. The leaves and flowers are stripped from the woody stalks, which are then ground. This is known as Heather Meal No. 1, and is used, mixed with molasses and some albuminous material to fatten pigs. Heather Meal No. 2 is made from the stems while still green and containing little wood. They are ground and mixed with molasses, and are used for horses and cattle. Heather is used with great success also among the northern neutrals, where it is dried, crushed, mixed with molasses, and made into cakes. Experiments have been made in several countries with bracken, but this has not been so successful as heather. In Austria, however, the root of the Eagle fern, which grows as a weed in Croatia and Bosnia, is an excellent fodder for pigs. It is stated that a ration of 4¼ pounds is ample for a full grown pig.

The use of foliage, twigs, and young shoots of any trees and shrubs has been largely developed in Germany since 1916. The cuttings of all trees and shrubs may be utilized, with the exception of bird-cherry, laburnum, ivy, acacia, and alder. The material should be collected in the winter before the buds burst. Sheep and goats can eat it unchopped; for other uses it should be cut fine in a chaff cutter and used wet or dry; but it must be kept dry if preserved at all, otherwise it will mildew. This year it will be collected officially in Germany.

The German Leaf Fodder office states that "the young spring leaves are the most valuable for the making of leaf fodder, as the cellulose is still tender and soft and its layers supple and alive. The cells are full of life and filled to the utmost with plasma and sap. They are rich in salt, starch, and sugar. Hence, it should be collected chiefly during May and June, as it contains more nourishment then than later in the summer. Ten hundredweight of leaf fodder collected in May and June contain the same amount of digestive matter as fourteen hundredweight collected in the autumn. It is also more nutritious then, gives the horses an appetite, strengthens their digestion, and is good for their health." The only fodder substitute of this sort used in France to any great extent is vine waste.

The varieties mentioned above are the only ones which are now commonly used. There are numerous other fodder substitutes, however, some of which are most ingenious. Pine and fir needles have been used in Sweden, potato tops in Norway, hazel catkins have been dried and used as a sort of fodder flour in Germany, and in Austria-Hungary stinging nettles were being resorted to last January. Perhaps the strangest fodder substitute of all, however, is cockchafers, a kind of beetle which are being collected throughout Germany and Austria by school children, and are reported to be excellent food, when dried, for pigs and poultry—U. S. Food Administration.

If you run your household on the sugar allowance Uncle Sam asks you to, or less if possible, the grocer this fall won't have to hang up a sign: "No Sugar."

"The American people will gladly make any sacrifice in consumption and in the production of foodstuffs that will maintain the health, comfort, and the courage of the people of the allied countries. We are, in fact, eating at the common table with them."—President Wilson.

Who Fills Your Silo

THERE'S just one way of being sure of a full silo of clean cut ensilage. That is to fill with your own equipment. A farm gas or kerosene engine developing as little as 3 or 4 horse power will operate a small

PAPEC

Ensilage Cutter

If a saving of from $100 to $200 a year appeals to you, you owe it to yourself to investigate the *PAPEC* Ensilage Cutter. Our 1918 catalogue illustrates in three colors and fully describes each of the four sizes of *PAPEC* Cutters. There's a size for your very needs. We have a catalogue for you—write for it today.

Get A Gehl Silo Now

Act quickly to save your corn crop—to save money—to back up your government. Councils of defense and other war winning organizations as well as agricultural authorities are urging farmers to build silos this year so as to increase and conserve food supplies.

We Can Ship Immediately

Special attention will be given to rush orders. We have the material in stock and can make prompt shipments.

Gehl Silos are made of the best ensilage-preserving wood in the world—clear, straight-grained Oregon Fir which is recognized as the best silo material, not only because it is very strong, lasting and durable, but because it keeps the air out and the moisture in, preserving the ensilage in perfect condition and retaining the appetizing flavor that makes the cows relish it.

Gehl Silo lumber is perfectly milled to standard silo pattern and is strictly clear and free from knots. One or two piece staves in any length up to 40 feet. As our contribution towards this silo campaign we will allow

A Special Discount on All Sizes

ordered during August and September. Write today for full information. State size of silo you want.
If interested in ensilage or alfalfa cutters ask for cutter catalog.

GEHL BROS. MFG. CO., Dept. 122 West Bend, Wisconsin

FOR MILKING MACHINES

Clear and Clean as Water

B-K keeps tubes and cups sweet and clean. Penetrates milk solids—kills the bacteria. Is clean—harmless—cannot taint milk. B-K makes rubber parts last longer—cannot harm metal. Used and recommended by Milking Machine Manufacturers for years. Cheapest in actual use—sold under guarantee. Get B-K today—end sour milk troubles. Send us your order and your dealer's name. Send for dairy bulletins and "trial offer."

General Laboratories—Madison, Wis.
278 So. Dickinson St.

8 FEET MORE SILAGE

Send at once for FREE INFORMATION on Buckeye Extension Silo Roof. Greatest ever—25% more capacity—protects silage from snow, rain, birds, etc.—no second filling—pays cost first year—many patented features—operates from ground—numerous testimonials—cut shows roof open.

AGENTS WANTED

We can make a good proposition to present silo agents, or others, to handle our line of metal roofs, cribs, bins, etc. If interested, write at once to

CHANDLER SIX

FAMOUS FOR ITS MARVELOUS MOTOR

This Is a Car You Need In Your Business

A FARMER said recently, "To take the automobile from the farmer would be like taking the railroads from the country."

It is very generally agreed among intelligent people that the automobile is primarily a necessity to the progressive farmer.

Any automobile is of service to you.

The Chandler is of most *dependable* service to you. And in your business you want a dependable car.

The Chandler is like the big fine railroad, with rock-ballasted roadway, great steel bridges, bad grades cut down, mighty mogul locomotives and clean, deep-cushioned, easy-riding steel coaches.

The Chandler is famous for its marvelous motor, Chandler-designed and Chandler-built and now in its sixth year, without radical changes but with constant refinement until today it approximates perfection.

The Chandler motor is full of life and power. It will take you *anywhere*, and get you back quickly if you want to drive fast.

Nearly fifty thousand Chandler owners, many of them successful farmers, are Chandler enthusiasts.

Don't skimp on your new car this Fall. Make it a real car. Let it be a big and fine car, yet light and economical, that you can depend on.

Choose the Chandler for Your Car

7-Pass. Touring Car, $1795 *4-Pass. Roadster, $1795*
Four-Passenger Dispatch Car, $1875
Convertible Sedan, $2495 *Convertible Coupe, $2395*
All prices f. o. b. Cleveland

There are Chandler dealers in all principal cities and in a thousand towns. Some one of them is in position to show you the newest Chandler models. Write us today for catalog and folder "How Chandler Checks with High Priced Cars"

Abortion

I have a herd of 10 grade Holsteins and 2 pure-breds and have lost 6 calves in the last 18 months. The cows abort at about 7 months. How can I find out if this is contagious abortion? If it is, would a cow be sure to abort every time or is there a chance of her raising a calf after she has aborted once? Would it be best to sell off the herd and start over or to sell the ones that abort and buy others?

Medford, Wis. H. B.

To find out if contagious abortion is present you could have a sample of blood from each cow tested at the state experiment station. It may, however, safely be taken for granted that contagious abortion is present and there is no specific remedy. A cow may carry her calf the full time after abortion, once or oftener. You might as well keep the cows and after cleansing, disinfecting, and whitewashing the stable and having the cows disinfected by a veterinarian, use disinfectants in the stable twice a week and have each cow and heifer thorougly disinfected before breeding.

Jersey Cattle Notes

For week ending Aug. 2, 1918:

Number of animals registered: Bulls, 164; cows, 404; total, 568. Number of transfers recorded: Bulls, 191; cows, 589; total, 780.

Kentucky Tester Law

The Kentucky legislature has passed a law requiring each creamery and skimming station, and in fact every dealer who buys cream in Kentucky, to procure a license from the Kentucky Experiment Station. Also the man or woman who operates the Babcock test in each establishment shall procure a license from the experiment station. Also only tested glassware shall be used in making Babcock tests. An examination of men who desire to make Babcock tests will be held at the experiment station at an early date. All interested are advised to procure a circular of information that is being issued by the experiment station. The law becomes operative immediately and a fine is imposed on any one who neglects to obey the law.

Kentucky. J. J. HOOPER.

DAIRY MARKETS

Nebraska Breeders' Meeting

The Gage County live stock breeders have planned an extensive campaign for the promotion and extension of better stock in the county.

At the first annual meeting of Gage County, Nebraska, breeders called by County Agent L. Boyd Rist, officers were elected for the coming year as follows: F. C. Crocker, president, Frank Thornburg, vice-president, John Bunte, treasurer, and L. Boyd Rist, secretary.

The following resolution was unanimously adopted at the meeting:

"Resolved, that we, the members of the Gage County Live Stock Association assembled this day in annual meeting, do pledge ourselves to do our utmost to aid and support the government in winning the war, and to exert our best efforts for maximum production of crops and live stock to this end."

A county breeders' directory will be published by the association. This will include a resume of the live stock activities of the county with a list ccntaining the name of every breeder of pure-bred stock.

Gage County has more pure-bred live stock breeders than any county in the state, over 250 men in the county owning pure-bred herds.

Another advertising scheme which will be promoted this fall is the placing of sign boards at the borders of the county. These boards will bear the inscription, "Welcome, Gage County Pure-bred Live Stock Center."

H. J. Gramlich, head of Animal Husbandry Department, gave an interesting address at this meeting.

Nebraska. L. BOYD RIST.

World's Largest Creamery

Australia claims to have the largest creamery in the world, a co-operative manufactory, owned by The North Coast Co-operative Company. During the half year ending April 30, 10,627,543 lbs. of butter were made and sold for $3,895,915. The number of patrons, 1904, as well as the amount of butter made and the price received, constitutes a record in the creamery's history.

MOOSE HILL FARMS, SPENCER, MASSACHUSETTS.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Running a Cream Separator

How many of you ever use a cream separator? Nearly every Hoard's Dairyman Junior does sometimes and a great many of you have to use one every day, for where cream is sold or butter made it usually falls to the lot of the farm boy to do the separating.

It is, therefore, up to you to know how to operate a separator. Can you do it? Every one of you would probably answer "yes" to that question and yet we wonder whether you really do understand all about it. Do you know just what will increase or decrease the loss of butterfat in the skimmilk? That's something worth knowing and it is something a good many of us don't seem to know or at least to remember. Two of the important factors are: temperature of the milk at the time of separation and the speed at which the machine is operated.

Temperature of the Milk

Do you know that it makes a difference whether milk is warm or cold when it is separated? It does, and an important difference, too. The cream separator skims best when the milk is at fairly high temperatures,—from 85 degrees to 95 degrees F., which is only a little below the body temperature of the cow. Of course it would do just as well if the milk were much warmer but it is not at all necessary. At a lower temperature, say about 70 degrees, the milk flows slower and more butterfat appears in the skimmilk.

The New York Experiment Station tried it out to see if it were true. They took several cans of milk and standardized it so that it all contained the same per cent of butterfat. One can was separated at a temperature of 90 degrees F., another at 80 degrees, and a third at 75 degrees. Samples of the cream and skimmilk for testing were taken each time. All the milk was run through the same separator and the machine was run at the same speed each time.

When the different samples of skimmilk were tested, they found that the milk run through at 90 degrees tested .02 per cent, that separated at 80 degrees .04 per cent, and that which was at 75 degrees tested .07 per cent. Certainly the temperature did make a difference. Just what that difference would amount to on a small dairy farm, we can easily figure out.

Suppose that this particular dairy herd is producing 400 lbs. of milk a day. After being separated that would mean about 320 lbs. of skimmilk every day or 9,600 lbs. during the month. If there was .02 per cent of butterfat in the skimmilk, it would amount to a total of 1.92 lbs. during the month. On the other hand, had the milk been separated at a temperature of 75 degrees F., so that the skimmilk tested about .07 per cent, the loss for the month would have been 4.8 lbs. greater. At 50 cents per pound this extra loss would have amounted to $2.40. Worth saving, isn't it? It certainly is and, moreover, from a large herd the loss would of course be greater.

One of the Tippecanoe County, Ind., Sheep Club boys taking a lesson in shearing sheep.

It will pay you then, to separate the milk while it is still warm,—as soon as possible after it is drawn.

Speed

The speed at which the separator is run is another important consideration. Notice the directions that came with your separator and you will undoubtedly find that the manufacturer recommends that the handle be turned a certain number of times per minute.

Now there is a good reason why that separator should be run at such a speed and in order to understand it, you must know how the cream separator works. When the handle is turned, that inside bowl revolves at a high rate of speed as you undoubtedly know and when the milk is whirled rapidly in this way, the heavier part goes to the outside and the cream, which is lighter, is drawn off from the center of the bowl. If that bowl does not whirl fast enough you can readily see that the separation of cream from skimmilk would not be complete and some of the butterfat would be lost.

This is exactly what happens when you get to thinking about something else and forget to keep the separator running fast enough. You are wasting butterfat, and that same thing is happening on many dairy farms in this country every day. Men who have studied these losses claim that on a great many farms they amount to from 7 to 12 pounds of butter per cow every year. That's a good deal to pay for carelessness. Is it true on your father's farm?

My Start in Dairying

HOARD'S DAIRYMAN JUNIORS:—I have been a Hoard's Dairyman junior ever since it has started and always read the junior page and every year help get Hoard's Dairyman subscriptions and it is a great thing to me. I am going to stay by the Hoard's Dairyman and learn more about cattle.

Now I am going to tell you juniors how I got my start. When I was a boy about 10 years old my father gave me a pig and I sold it for $14, and then bought a grade calf and sold it, and got another and raised it up and sold it, and got another and raised it and sold it, then got a colt and kept it a year, then sold it. Then bought another calf. My father always feeds my stock for helping him. After I had 3 grade cattle I wanted some registered cattle. I got Jerseys. I had them about 2 years and I thought I would rather have Holsteins so I sold some of my Jerseys and got Holsteins. I still have an imported Jersey cow left. She made a record of 346.8 lbs. fat last year. This is the way I worked my way up with my own money.

Now I am going to tell you juniors about my Holsteins. The heifer's name is Fayne Concordia Korndyke, born Dec. 20, 1916. Her sire's dam is an 18-lb. (14.4 lbs. fat) 3-year-old and her dam is a 16-lb. (12.8 lbs. fat) heifer. She made this record at 22 months of age and her 7 nearest dams average 21 lbs. (16.8 lbs. fat) and there is only one dam in the pedigree that is untested. This is what the Hoard's Dairyman has done for me. My cow's name is Linnwood Ruby Hengerveld, born Oct. 9, 1915. She has an A. R. O. record of 13.30 lbs. butter (10.64 lbs. fat), 241.30 lbs. milk, average test of fat 4.41 at the age of 24 months. Her sire's dam has a record of 31.01 lbs. (24.8 lbs. fat) in 7 days at 6½ years old and 895.5 lbs. of butter (716.4 lbs. fat) in 1 year at 2½ years. Her dam is a 16-lb. (12.8 lbs. fat) 4-year-old. This cow is bred to a 22-lb. (17.6 lbs. fat) bull. My cow was in the Howell April sale. I bought her for $205. She will make a good start for a 16-year-old boy and the heifer, too. I have got 3 cattle in all and would like to hear from some of the juniors. My address is Capac, Michigan. I also have a number of pure-bred Flemish Giant rabbits. I have a doe 5 months old and she weighs 7½ lbs.

I wish good luck to the Hoard's Dairyman juniors.

Michigan. ELLIS TOSCH.

Junior Letters

Hoard's Dairyman Juniors:—As I have not written for a long time perhaps you may think I have withdrawn. I was so busy with my school work. I was in the eighth grade and passed the county examination. I tried to get subscriptions for your paper but failed to do it as many of the farmers take the paper already. I like to read the Junior page very much.

All the crops look good except the hay. The hay is very thin because the clover is all killed out. Our corn is too high to cultivate it.

We are milking 14 cows. Seven of these are pure-bred Holsteins. I still have my heifer. She will be fresh in December. August the 16th she will be two years old.

We have 20 spring pigs; 19 are Poland Chinas and 1 is a red one. As we only have one red one my father gave it to me.

I planted about a half an acre of potatoes and beans. I have hoed and cultivated them only once for they are not very weedy.

We have started to make hay but it rains on it now.

My father bought a pure-bred Holstein bull calf last spring. He is a little over a year old now.

As my letter is getting long I will close wishing the Juniors good luck.

Wisconsin. Fred Weiner.

Hoard's Dairyman Juniors:—I bought a calf from my father. The 26th of June she was three months old. She has bright eyes. When I call her she will come to see what I have for her. Her name is Crystal. Her mother's highest record is 56.9 lbs. of butterfat in one month.

My little sister, only six years old, feeds one of the calves. She is very interested in feeding calves or in weighing the grain for each cow.

This spring we bought our first pure-bred Guernsey bull. His name is Annie May's Dick of Four Leaf, No. 48503. He got a little stiff which puzzles me very much. His stiffness was more noticeable when he was turned out on pasture. He was going on six months when we bought him. We continued to feed him calf meal and from 2 to 3 lbs. of sweet milk for 1 month. He was fed mixed hay and gradually increased to 4½ lbs. of grain after he was weaned. His grain mixture consisted of oats, bran, and oil meal, which was fed morning and evening. A little whole oats was fed at noon. He is a good eater and has a good dairy disposition and construction.

Wisconsin. Erwin Pflughoeft.

Hoard's Dairyman Juniors:—Since you have not written me I thought I would write to you. My calf is 17 months old. I am going to breed her this fall. The next time I write to you I wil send you her picture.

Papa has 50 spring pigs and 19 gilts and 10 brood sows. We are going to have a sale next spring. We have two herd boars. Their names are Big Jumbo Cheaf and No Wonder.

We are milking 8 cows. We have three pure-bred Holstein cows. We put one on a 7-day test and she made 21.19 lbs. butter. She is a three-year-old. Her name is Devara.

We are short of sugar and flour down here.

Kansas. Clarence J. Barnett.

FAYNE CONCORDIA KORNDYKE, OWNED BY ELLIS TOSCH, A MICHIGAN JUNIOR

Hoard's Dairyman Juniors:—I have not written for a long time so I thought I had better write. How are all the Juniors?

We are milking about sixty cows now and getting twenty-four cans of milk. We have five acres of corn and it is doing nicely. I am feeding nine calves. I am just feeding them grain. They are in the pasture so they don't need much.

I milk from four to eight cows every night and morning. My sister's little Banty hen just hatched six little Banties.

We have eleven Banties, five Plymouth Rock pullets, and three White Leghorns. With all we have eighteen chickens.

We have 15 acres of oats.

I read the Junior page every week. I enjoy it very much. As it is almost time to milk I will close wishing all the Juniors good luck. My address is Everett, Wash., R. F. D. No. 2. Hope some of the Juniors will write to me.

Washington. Dudley Kooistra.

Hoard's Dairyman Juniors:—This is my first letter to the Juniors. As I have just finished reading the Junior letters I will write about some of the things on our farm. I am leading one of the little heifers around that I have, and I am going to drive her with reins soon.

I am at my aunt's now. We have 3 Jerseys, 2 Guernseys, and 2 Holsteins. We have 2 Jersey calves, 3 colts, 2 horses, and 2 little pigs. We have 41 hens and we get from 20 to 25 eggs a day. We had 68 chickens until something got about 50 of them. It was a black and white animal. We set a trap and caught him. He did not get any more chickens. The people that went past did not have to be told what it was. Will you?

As my letter is getting long I will close wishing all the Juniors good luck.

Maine. Florence Small.

Hoard's Dairyman Juniors:—I received your letter and I think it is kind of you to send my letter to Miss Gertrude Nylkema. You asked me to write again so I might just as well do it putting things in about my father's farm.

I told you in my first letter that we are Holland folks. We are a family of eleven, five sisters and four brothers. My parents first moved from Holland to Peterson, N. Y., then to Grand Rapids, Seattle, Snohomish, back to Grand Rapids, and now we live on a farm on the Snohomish River. We have about ninety acres of river bottom land, and forty acres of hill. We have a new 110x42 feet modern built barn with steel stanchions. We put our hay above the cows. We also have a new house, 8 rooms, 2 stories high. And a new silo 36x14 feet.

We've got about thirty milk cows, Guernsey and Holstein. We are going back to the Guernseys altogether. We like them better than any breed. It doesn't take a bale of hay to a feed and they give just as much milk. We have a registered sire, Marshal of Maple Grove 1402, just transferred. And one cow, Dorothy Fernwood 54723. We also bought some grade heifers. My father says he would like to have a little extra cash and then he would go down to Wisconsin, where he would buy about twelve nice cows.

We have four nice horses, 3 black Percherons which we bought this spring, a span of mares, full sisters, one is four years old and the other is five, and a five-year-old horse whose name is Johnnie. He is certainly our pet. We girls ride him around, use him single or double, and he also is a beautiful black Percheron. We have a nice Hamiltonian and a fast one. My father don't like autos. He says people run themselves to death, too much pleasure and no work.

We killed one hog this week. It was seven months old and dressed 185 pounds. We have four more, 2 for home use and two for breeding. My father and mother like to raise ev-

"Customers, gladly pay more for butter they know is as perfect as when it first comes from the churn.

"That's why I wrap my butter in

Paterson Pioneer Parchment Paper

"Keeps it clean—sweet—pure. Makes my butter *worth* more and *sell* for more. Yet, the small cost of this Parchment Paper isn't worth considering when compared with my extra profit."

Grow Registered Seed

Of the following pedigreed varieties developed at the Michigan Agricultural College and Inspected, Approved and Registered by the Michigan Crop Improvement Association.

RED ROCK WHEAT
A pure, winter hardy, excellent milling, high yielding wheat.

MICHIGAN WINTER BARLEY
The best northern grown Winter Barley.

ROSEN RYE
The rye that has nearly doubled Michigan's acre yields and is giving exceptionally good results in many other states. Remember rye cross fertilizes so get pure seed from farmers who have produced it under inspection. For list of those having it for sale write the
Secretary of the Michigan Crop Improvement Ass'n., J. W. Nicolson, East Lansing, Michigan.

BLANKE'S COW TAIL HOLDER

Simple, Effective, Durable.
A patented device for holding a cow's tail when milking to prevent switching of tail in face or eyes of milker. Instantly and easily adjusted.
Price 25c, Postpaid.
Blanke Mfg. & Supply Co., St. Louis, Mo.

erything at home. We can beef, pork, salmon, beans, cabbage, and berries.

This is a good country for cows, it is not very hot nor cold. We raise most of our own feed. Hay, clover, grasses or oats for hay. This river bottom will sometimes produce 100 bushels to an acre. Potatoes, corn, Danish ballhead, cabbage, and rutabagas do well here. We have eight acres of corn. You asked me if we could raise corn. I guess we can when it gets from 10 to 14 feet high. My father thinks his 8 acres of corn will almost fill his silo.

We do all our work together. We milk 26 cows now and are getting about 100 gallons of milk a day. We sell it to the Carnation condensery at Monroe, 4 miles from home, the same company who bought the $106,000 bull in your state I think. We milk 6 o'clock in the morning and 6 o'clock at night. This is the only time my dad don't want us to talk much. We work about 3 hours in the forenoon and two hours in the afternoon.

My father don't like to hire his help here. They want $80 and board and are too straight backed for hoeing. My oldest sister does most of the teaming. She does some plowing, harrowing, and many other things. Three of my sisters help my mother, and Garm, Carl, Winnie and I do a little field work. Johanna, Heinie, and Johnnie do the playing. We are going to pick wild blackberries now for canning. They grow near our house on the hills. We have spring water running to the house from the hill.

I must write you a bear story. When Winnie and Heinie went after the cows the other day they saw a big black bear running among the milk cows. She got scared and ran for home. I don't know who ran the fastest, they or the bear. We tried to find the bear with the gun but all we found was his tracks where he took a bath and where he feasted on grass. The lake is in the corner of our field near the lone hill.

We also got a nice buck deer last fall. My father and a friend got him, and dad was all in because he had to pack him a long ways and it weighed 175 pounds.

My father is well known here. Just ask for Gus Danhof at Monroe or Snohomish. We have a nice lake for bathing and a dandy river for fishing.

Washington. Mary Danhof.

Hoard's Dairyman Juniors:—I received your letter June 19. You asked me how old the sow was. She is about 5 months old and large for her age. She is a dandy marked Berkshire. I think I will keep her for breeding purposes. Her mother got first prize at the county fair last year. I like to trap very much. My sow's mother had 9 pigs, 5 boars and 4 sows. We sold 3 boars and 1 sow. Two of the pigs died.

How I came to get my cow, well my father gave her to me because he sold my heifer calf for beef. He didn't think she would amount to much.

We have 3 cows and one heifer. Two of them give milk. The other will freshen this month. The heifer is a nice heifer. She is about one year, six months old.

We have quite a large garden this year.

We have Rhode Island Reds and Plymouth Rocks together so we can't tell how the Reds lay alone. We have 100 hens and get from 50 to 70 eggs a day. The Rhode Island Red chickens are growing fast. They will be laying by fall. We will cut our grass soon.

I like to trap very much. I trap skunks and muskrats. I like to hunt. I have a 20-guage shot gun. I think I will hunt this fall with it. I hunt foxes, rabbits, squirrels, and raccoons, partridges, and other birds.

I wish some of the juniors would write to me about their experiences with trapping. My address is Box 82, North Scituate, R. I.

Alston P. Spencer.

Hoard's Dairyman Juniors:—How are all the juniors getting along? I live on a 134-acre farm 4 miles from Monroe, Wis. We have 23 cows, 6 horses, and six fall calves. We have 21 little pigs. Two were smaller than the rest, so my father said I could have them. I put them in a pen from the rest and feed them milk. The pig I had last year I sold and it weighed 210 lbs. I bought nine war saving stamps with the money. We made 12 loads of alfalfa hay this year. We are cutting some barley hay just now. We are going to make oat hay as soon as it is headed out.

We have a large spring on our farm. So we call it Spring Water Dairy Farm.

My address is Box 50, R. 5, Monroe, Wis.

John Haldimann.

Hoard's Dairyman Juniors:—It has been a long time since I wrote you last but I will make up for lost time.

My father joined the Vanderburg Cow Testing Association this year. Our first tester was in the draft. His name is W. H. Ferguson. He was called to the colors in June. Then they sent us another tester. His name is Miller.

We have two cows, one bull, four calves, and about 200 old and young chicks.

My brother and I joined the Gibson County Pig Club. My brother's pig weighed 73 lbs., and my pig weighs 50 lbs.

I am eleven years old.

I wish some of the juniors would write me. My address is Box 59, R. R. 31, Oakland City, Ind. Charles E. Farmer.

Big Game Rifles and Metallic Cartridges
for Shooting Right

STILL-HUNTING—stalking your game, like a sportsman—appeals as strongly as ever to the man who is all man. But to bring home venison it is necessary nowadays to shoot *right*, at the first opportunity—it may be the last.

When that well earned chance comes, be ready with a Remington UMC Big Game Rifle (either pump action repeater or the autoloading model), made to shoot *right*. Has the speed, the accuracy and the punch to do its work quick and clean.

Easy to shoot because fit, balance and design are *right*—no lever or bolt to blindly grab and wildly yank, your hands stay *right* for shooting—handles nicely and is comfortable to carry—simple, strong and reliable.

To complete *the perfect shooting combination*, buy Remington UMC metallic cartridges, for years the *right* choice for use in all kinds of rifles all over the world. When improvements are made in metallics, Remington UMC makes them first.

FARMS FOR SALE

If you wish a farm in the best grass section of the south where alfalfa and all the clovers, including Red White, Alsike, Sweet, Burr, Crimson and Japan grow to perfection, also soy beans, cowpeas, peanuts, velvet beans, corn, oats, wheat, rye, and barley where we have a creamery making fine butter and paying Elgin for butterfat, and where there is no bovine tuberculosis nor cattle ticks; in a community of northern farmers, write to H. B. GURLER, Macon, Miss. 25-tf

Hardwood cutover land, silt loam, clay subsoil. Neither sandy nor gravelly. Close to town. Good roads. Good schools. In the heart of the dairy country. You deal direct with the owners. No agents and no commissions. Easy terms. Write for map and booklet 4. NORTH WESTERN LUMBER CO., Land Dept., Stanley, Wis. 1-42

Farms in the Mississippi Prairie Belt, improved and unimproved, only $50 to $65 per acre. Fine alfalfa, corn, grain and pasture lands, natural rich soil, level and slightly rolling. Good roads, schools and churches, creamery, etc. Main line of railroad. Best all the year around climate, artesian water. H. H. HANSEN, Macon, Miss. 11-tf

Booklet on request presenting facts by State Commissioner of Agriculture describing the Mazarn Valley in the Ozarks, ideal for dairying and stock farming. Address MAZARN VALLEY LAND COMPANY, 847 Central Ave., Hot Springs, Arkansas. 1-tf

Improved Farms—In Barron, Polk, and St. Croix counties. Near Twin Cities. For particulars address JOHN McCOY, Owner, New Richmond, Wisconsin. 3-4

For Sale—Farm, stock and machinery, on easy terms. This farm, containing 105 acres, is situated on the famous Eagle Chain-of-Lakes, adjoining Eagle River, the County Seat of Vilas County, and is an ideal dairy farm. There are three houses on it and two barns, equipped with 48 stanchions, 7 pens, the James fixtures. Chicken house 14-80 feet, wagon shed, electric lights, complete water system, woven wire fencing. 60 acres in a high state of cultivation. Including fine team of bay mares, 15 head of cattle, part of them registered Guernseys. Price $17,000, including live stock and machinery, and all crops except oats. Terms, $5,000 cash, balance $1,000 a year at 6% interest. This is a big bargain, as the returns from this farm will pay for it. Good reasons for selling. Come and look it over. For further information write M. E. SANBORN, Eagle River, Wisconsin. 4-2

For Sale—Dairy and stock farm, 400 acres. 150 acres cleared, 120 acres in pasture, balance in timber. Nine-room modern house, city water and electric light and power. Basement barn 120x32, modern, city water, milk house adjoining. Silo in barn. Horse barn, machine shed, granary, wood house, chicken house. Well equipped with farm machinery, three-unit Perfection Milker, good as new; Great Western separator; 8 pure-bred Holstein cows and heifers; 19 grade A-1 cows, pure-bred sire; 30 Shropshire ewes, seven head hogs, five head horses and mules. January receipts from 17 cows in milk, $435.00. Cheese factory and creamery ½ miles, pea factory ¼ mile, graded and high school ¼ mile, Omaha railroad station ½ mile. Beautifully located, lies high overlooking town and lake. Good demand for building lots and acreage for part of farm in city limits, no other land available. Terms: Will sell farm, stock and machinery, or farm alone. Price for farm $65 per acre. Stock and equipment $8,000. $10,000 down and balance at 6%. Farm owned and operated by doctor going into army medical service reason for selling. DR. J. B. SHERBON, Cumberland, Wis. 4-3

Getting Started With Pure-breds

The following quotation is taken from the Bulletin of the Maine Department of Agriculture and contains the remarks of a successful dairy farmer to a group of men interested in beginning with pure-breds. The statements ring with truths gleaned in the school of hard, practical experience in the building of a profitable herd of pure-breds:

"I met with disappointment from one of the bulls which I bought, not from a production point of view, as the production was increased immensely, but there were misplaced udders in his offspring. The teats were not put on where they ought to be; the bag was not the right shape. There were not many hard milkers, but the shape of the udders was not improved. I saw my mistake and in making my second selection I saw the dam and the grandam of the sire of the calf I bought, and also I knew by reputation the sire's sire and the sire's dam. I do not think I ever saw as great an improvement in one generation as there was in the shape of the udders of the heifers sired by him, and the placing of the teats, as well as in the production.

"It was production that I was after when I bought my first pure-breds, and that was the point I had in view. I did not have the courage, with the obligations I had on me, to go into high priced fancy bred stock. I might say that I bought the breed I did, not because it was at that time greatly my preference, but because I could get pure-breds in that breed for a little less money than in any other breed, as an intimate friend of mine, who I knew would not do me a wrong, had a herd from which I could get selections at a reasonable price. I paid $975 for pure-bred stock. I also bought a set of milk scales, and it was the best investment I ever made in my life. Any dairyman who is not using them regularly is making a mistake. I do not mean that you should use the milk scales and never add up the sheet. You should use the scales, weigh the milk, put it down, add up the sheet, and follow its lessons. It is of no use to weigh the milk unless you are willing to abide by the scales. When you have resolved to do that, and stick to it, then you can improve your condition. Nine hundred and eighty-three dollars was the total extra outlay in my herd to bring about an increased average production of 54 per cent in milk and 73 per cent in butter, in ten years' time. This is within reach of any farmer. Perhaps you are in a cow testing association. If you are not, you ought to be. I had to do this work independently, because at that time there were no such associations. Since the organization of our Farm Bureau, 3 years ago, we have a cow testing association in our immediate vicinity, and I am now doing the work through that. It allows me more time to myself if I have a tester do the work, and I think he can do it cheaper than I can. But if you are not in a position to join a cow testing association you should do the work yourself, as you cannot afford to keep dairy cows unless you conduct your dairy work on a business basis, and you are not conducting it on a basis unless you open an account with each individual cow and know what she is doing."

Australian Co-operation

Australia furnishes a notable example of successful agricultural co-operation. The Coastal Farmers' Co-operative Society has issued its balance sheet for the eighteenth year of co-operative marketing of the various products of Australian farms. The remarkable growth of the organization is well illustrated in the increase in its operations year by year. The total sales the first year amounted to $349,692; the fifth, $2,162,998; the tenth, $4,773,029; and the eighteenth, for the year ending March 30, 1918, $12,841,849.

73—HEAD—73

Holsteins At Auction

SEDALIA, MISSOURI

Thursday, Sept. 5th, 1918

AT MISSOURI STATE FAIR GROUNDS

Pettis County's First Annual Combination Holstein Sale

73 HEAD of Pure-bred and Grade Holsteins will be sold owing to the great drought and consequent shortage of feed, and to the fact that the men are closing out their grade herds to make room for pure-breds, as Pettis County has been made the center of the Pure-bred Holstein Industry of Missouri.

Included in the sale are 41 grade females from bred yearlings to mature cows part of them springers, 15 grade heifers, open yearlings and calves and a large number of pure-bred bulls and bull calves from a few months to over a year old.

Everything over 6 mos. of age will be tuberculin tested. Every animal must be just as represented or no sale.

Under the Auspices of the **Pettis Co., Missouri Bureau of Agriculture, U. S. Dept. of Agri., Missouri College of Agri., and Pettis County Court, Co-operating.**

For farther information, address C. M. Long, County Agent, Sedalia, Mo.—Col. C. J. Hieronymus, Sedalia, Auct.

GEO. S. BIGELOW, BREEDSVILLE, MICHIGAN.

Beaumont Farm, Mt. Savage, Maryland

Our herd sire is KING COLANTHA RAG APPLE, son of Rag Apple Korndyke 8th. His dam is a 30.51 lbs. at three years; granddaughter of Colantha Johanna Lad. *Could you imagine a finer combination?* We consider him one of the best bulls Mr. Cabana ever sold. In build and conformation he is the admiration of everyone who sees him.

We have a son of his, born April 18, 1918, a beauty in every respect; beautifully marked, more white than black; straight in every way. He is out of Van Briseis Pontiac Asiatic 32.60 lbs., a granddaughter of King of the Pontiacs.

This bull will be sold at a reasonable price, and will be worth $2,000.00 when he is ten or twelve months old.

Milford Meadows Stock Farm

Now Offers For Sale

M. M. Rag Apple Oak Denver

A most promising young sire, born June 4, '17. Nearly half white and an exceptionally good individual.

His sire is Dutchland Creamelle Denver Prince, a 36.25-lb. grandson of Colantha Johanna Lad.

His dam, Milford Josephine Oak DeKol, made 22.82 lbs. butter as a junior 2-year-old in June. Her sire is a son of Canary Paul Fobes Homestead and from a 29.55-lb. daughter of Homestead Junior DeKol. Her dam, 31.77 lbs. butter, 616.2 lbs. milk, is a granddaughter of Dutchland Sir Pontiac Rag Apple.

The three nearest dams of this young sire average over 30 lbs., one a junior 2-year-old. His dam is one of our good prospects and is to be retested this winter.

Milford Meadows Stock Farm, - Lake Mills, Wisconsin.

RICHLY BRED HOLSTEIN BULLS

from 5 to 16 months of age and sired by King Korndyke Veeman, the bull with 40-lb. breeding, whose two nearest dams average over 37 lbs. butter in seven days. These bulls are out of cows with large A. R. O. milk and butter records. Write us for full particulars.

Wisconsin Star Stock Farms, Ed. M. Schultz, Hartford, Wis.

J. A. Leach, 203-205 Savings Bank Bldg., Cortland, N. Y.

Hazelhurst Stock Farms

Offer a Yearling Son of King Segis Pontiac Canary

who is a 30-lb. son of King Segis Pontiac. Youngster's dam is Hazelhurst Rouble Clothilde with 7-day record of 30.32 lbs. butter and 579.3 lbs. milk. His dam and sire's two dams average butter 7 days, 32.78 lbs. and for 30 days 126.54 lbs. He is nearly white, a fine individual and very straight. Priced for quick sale. Write.

H. H. Wickwire & Son, Hubbardsville, N. Y.

Your Last Chance!

To Get a Son of The World's Greatest Sire

KING OF THE PONTIACS

We have only a few left. Here is a beauty born April 20, 1918, about three-quarters white, out of an 18.82-lb. three-year-old whose sire is a $4,000, 40-lb. grandson of King Segis. Think of this combination of breeding. King of the Pontiacs and King Segis. First check for $500 takes him.

Geoffrey Burlingame, Cazenovia, N. Y.

Soon Ready for Service

Young Holstein bulls from good Official Record dams and sired by SPRING FARM KING PONTIAC 6TH. Fourteen of his first sixteen two-year-old daughters last winter each made better than 20 lbs. of butter in seven days; a showing never before equaled by the first two-year-old daughters of any other sire. These young bulls are nice straight, thrifty, desirable animals. We would be glad to write you full particulars. You will be surprised that our prices are so low for so much quality.

Henry Stevens and Son, - Lacona, N. Y.

Lakeside Herd

Best Bulls For the Money

State about amount to be invested, with quality required. I will describe the best for the amount. Large number of females to select from, all ages. Highest individuality, large production, best type, best udders are characteristics of Lakeside Herd. **E. A. POWELL, Syracuse, N. Y.**

Springdale Farms

Grade Holsteins

Our herd consists of nearly five hundred head and they are all FOR SALE. We are prepared to furnish carload lots of fresh cows, springers or cows due to freshen this fall, also two and three-year-old heifers. If you want large, heavy producing cows it will pay you to see our stock. You will find our prices right. **F. P. SAUNDERS & SON, Cortland, New York. Office 50 Clinton Ave. Telephone 116 or 1476M.**

A Rare Chance

To secure a few choice Grade Holstein Cows

Just fresh and due within a few weeks. These cows were selected to furnish milk for a famous summer hotel which is soon to be turned into a Government Hospital. They are a very fine lot and will be sold in numbers to suit the buyer. There are only a few of this kind in New York State. Wire your arrival. Don't wait to correspond.

River Meadow Farms, Portlandville, N. Y.

You Can Still Get One But Act Quickly

Nearly all of our sons and grandsons of Pietertje Hengerveld Segis are sold. A few up to 11 months old from high record dams can be bought yet. Pietertje is the only bull living with 100 A. R. O. daughters and 55 sons. He is the best Segis sire living. Prices to suit you.

Susquehanna Farms, Hartwick Seminary, N. Y.

Ormsby Jane King 2nd

Two Nearest Dams Average 35.64

Ready For Service

HERE IS AN OPPORTUNITY for some small breeder to get a sire of exceptionally rich breeding and splendid type at a very reasonable figure.

ORMSBY JANE KING 2nd was a year old June 24th. He carries a straight topline and is nicely marked.

HIS SIRE, ORMSBY JANE KING, is a son of the "Great White Heifer", Ormsby Jane Segis Aaggie, who has a record of 46 33 lbs. butter and 879 lbs. milk in 7 days.

AS A FOUR-YEAR-OLD she broke the world's records by producing 44.42 lbs. in 7 days and 183.16 lbs. in 30 days.

NO OTHER COW IN THE WORLD has ever made two records above 44 lbs.

ORMSBY JANE SEGIS AAGGIE has a three-quarter sister, Ormsby Jane Piebe, with 38 lbs. in 7 days.

ORMSBY JANE KING'S dam and two nearest dams of his sire average 37.16 lbs. butter in 7 days and 147 lbs. in 30 days. Nothing left to be desired on the sire's side of the pedigree, is there?

THE DAM OF ORMSBY Jane King 2nd is Moneta Pietje with a record of 24.95 lbs. butter in 7 days.

SHE IS A SISTER TO Agnes Pietje and Ilmata Pietje, both with seven-day records above 34 lbs. as three-year-olds. Another 3-year-old sister made over 31 lbs.

THE DAM IS SIRED BY Hillside Della Pender Pietje who has three daughters with records from 31 to 34.86 lbs. as three-year-olds and six three-year-olds averaging above 30 lbs.

THE NEXT SIRE IS Woodcrest Pietje with 60 A. R. O. daughters, over half of them having over 20 lbs.

SO YOU SEE both sides of the pedigree are full of great sires and producing dams and besides this Ormsby Jane King 2nd is one of the first grandsons of the "Great White Heifer".

WRITE US TODAY FOR pedigree and full particulars.

The E. C. Schroeder Farms, Box 576-H, Moorhead, Minn.

NOW When Pastures Are SHORT

You Can Keep Your Cows up to the Fullest Flow

and make your milk checks show a handsome profit, even if your pastures are short, if you will adopt SCHUMACHER FEEDING PLAN.

Thousands of dairymen have solved their summer feeding problems and become entirely independent of the varying pasture conditions which confront them each summer, due to drought, hot sun, flies, etc., by feeding their cows the dairymen's "stand-by" SCHUMACHER FEED in conjunction with our high protein feed—BIG "Q" DAIRY RATION.

Too much is expected from pasturage as a rule. We forget about the hot sun and flies—and that cows spend a big part of the time in the field standing in shade (if they can find it) fighting flies. No wonder their milk flow drops off. Now is the time

SCHUMACHER FEED

and BIG "Q" DAIRY RATION will yield you a handsome profit—not only by preventing shrinkage in the milk flow now, but in keeping up larger yields during the fall and winter months. Also you will put the physical condition in better form for the next freshening period.

SCHUMACHER FEED is a "constitution" builder. Its high nutritive value provides the energy, vim and vigor necessary for the animal to keep going strong during the hot, "short pasture" season. SCHUMACHER FEED (as the carbohydrate ration) has more world Champion Milk and Butter records to its credit than all other feeds combined—it is the best known and widely used dairy feed in the world.

BIG "Q" DAIRY RATION is remarkable for the quality of its protein content, and the two combined form the most satisfactory ration—easiest to balance to suit individual requirements—that you can find. Feed BIG "Q" for milk—SCUHMACHER for condition.

If your dealer cannot supply you, write to us. (90)

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LVI | FORT ATKINSON, WIS., AUGUST 30, 1918 | Number 6

Milk, the National Drink

ENOCH H. JOHNSON, New York

YOUR featuring in Hoard's Dairyman the article by Helen S. K. Willcox under the caption "Why Not National Milk Week?" shows the value of the suggestion in your estimation. The plan of the National Milk Week should meet with popular favor and could be very readily worked out. Publicity and enthusiasm would put it across.

Why not make milk the national drink? There are a thousand arguments in favor of such a movement. I cannot think of one argument against it. Such a plan would not enrich a few breweries or distillers, but it would enrich the dairyman, the seller, the consumer, the community, the nation, and the world. Very likely there never would be any federal tax on milk—to the contrary, I believe every facility should be afforded to get it to the consumer at minimum cost.

The Dairyman

With milk the national beverage it would be a mighty stimulus to the dairy industry. Assured a steady market it would mean more dairies and better cows; sanitary barns and sanitary handling of milk. The more cows, the greater the soil fertility. The profit made by the farmer on milk would be returned by him to the consumer in a more abundant supply of farm products at low cost. It would lift the business of farming to a still higher plane.

The Seller

Can you imagine the glorious spectacle of a man standing up to the hotel bar with his wife and children, refreshing themselves with milk? No screens necessary, no federal, state, and city tax to come out of the seller's profits. His signs might announce: "Pure Guernsey, Holstein, or Jersey milk, fresh today in sterilized containers—kept on ice." A large sign on the wall should read as follows: "Dairy Products Make Us What We Are."

"Who are the peoples who have achieved, who have become large, strong, vigorous people, who have reduced their infant mortality, who have the best trades in the world, who have an appreciation for art and literature and music, who are progressive in science and every activity of the human intellect? They are the people who have patronized the dairy industry."—From an address by Dr. McCollum.

This same reading matter should appear on the hotel menu cards.

The masses would have free access to the milk counters—the amount of business in the "Milk Rooms" would insure the proprietors a good profit—none of it to be back-handed to the local political ward heelers. What a self respecting and community respected man the hotel proprietor would become! The barrier of ostracism would be removed.

Ice cream parlors should encourage the serving of cold milk instead of water with the ice cream. Wherever people gather at base ball and amusement parks, fairs, conventions, and shows there should be found the milk bar or the milkmaid serving the people with the refreshing food beverage.

The Consumer

The English language hardly contains descriptive words sufficient to enumerate the blessings and benefits that would come to him by drinking milk in contrast to alcoholic drink and camouflaged temperance beverages with their demoralizing influence. Drinking milk does not excite the passion or set the brain on fire as do alcoholic beverages, which is the great factor leading to crime, vice, and immorality.

The benefits are summed up in Dr. McCollum's classic above referred to and covers the situation in a nut shell. Again quoting Dr. E. V. McCollum, Johns Hopkins University, Baltimore, Md.:

"Whole milk is the perfect ration—the natural food. It is not merely a drink—it is a food. You eat milk. It nourishes the body, rebuilds and repairs the worn tissues. Most people eat too much. They overload their stomachs. Dairy products are easily assimilated. They give you a higher rate of food value, without taxing the stomach. The family whose meals are largely composed of dairy products are seldom troubled with digestive disorders.

"The food value of a quart of milk is the equivalent of three-fourths of a pound of beef, two pounds of chicken, or eight eggs. Compare costs—milk wins.

"Butter, cheese, cottage cheese, and ice cream, as concentrated products, are still higher in food values.

"Dairy products help solve the problem of the high cost of living. They save health. They save money. They save meat and wheat for our armies 'Over There'.

"The dairy-fed family lives more healthfully, more economically, more patriotically, and more sensibly, than families who live on meat, not milk.

"The children must have a dairy diet—adults should have it.

"For the sake of your family's health, and for the reduction of your living expenses, use more dairy products, and then some more."

The Community

Would you not like to live in the locality where milk was used as a refreshing beverage as well as for food? Very little work for the policeman or criminal courts; vice and crime largely eliminated; everybody healthy and happy; school children well nourished would excel in their school work; the hazard of the drunken chauffeur a thing of the past; the money saved by the habit of milk food drink would build and furnish happy homes.

The Nation

When all communities have the milk habit this nation would develop a wonderfully efficient people, a nation incomparable with any previous or at present existing. Its power would have a marked and beneficial influence on all the peoples of the world.

The statement has been made that to take beer away from the workmen in the shipbuilding yards would impair their efficiency. It seems to me that here would be an opportunity for the National Milk Dealers' Association to prove the value of milk in a very very practical manner. If they could make armaments to open up canteens for distribution of milk to the shipbuilders and supply it free to all for a stated time it would prove the advantage of the use of milk as a beverage.

When the workman is convinced that milk is as much a man's food as it is food for a baby, that he feels better physically and can work more comfortably and effectively, he will gladly get the milk habit. The basic principal of merchandising will apply to milk the same as to beer, viz., create the desire—make the product available and it is sold.

Why not make milk the national drink? The public press can put it across.

JERSEYS IN A GEORGIA VALLEY

Turkey is starving, Germany pinched, and Austria rioting for food The allies are well fed and full of fight, thanks to Uncle Sam who invited them to sit down to his table a year ago—he has been passing around the victuals ever since.

"It's the songs ye sing, an' the smiles ye wear,
That is makin' the sun shine everywhere."

—JAMES WHITCOMB RILEY.

Watch the soap dish. If there is improper drainage, much of the soap will be wasted. And soap is made from fats, which in these war days are precious.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 6 months, 50 cents; 3 months, 25 cents. Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through Wm. Dawson & Sons, Cannon House, Breams Building, London, S. C., Eng., or their agents, including the news dealers and book sellers in all foreign countries.

Subscription agents for New Zealand—Bray Bros., Agricultural Hall Building, Dunedin, New Zealand. Also—The New Zealand News Co., 150 Wakefield St., Wellington, N. Z.

Subscription agents for Australia—Australasian News Co., 226 Clarence St., Sydney, Aust.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $2.56, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of the Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome immoral and quack advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Wisconsin Jersey Meeting

The Jersey breeders of the Buffalo County (Wis.) Jersey Breeders' Association held their annual picnic at Wm. Armour & Son's farm, July 26. Many beautiful pictures and posters of Jersey cows sent by the American Jersey Cattle Club helped to boost the Jerseys. Mr. Houser, president of the association, gave a very appealing, patriotic talk which was followed by plenty of good music. Mrs. Ada Howie, a prominent Jersey breeder and extension worker, whose name is a household word in this state as one of the American women who have accomplished big things, gave the most entertaining and inspiring talk that the people of this country had had the opportunity to hear. She related her experience as a farmer and how she raised from one cow her famous Jersey herd.

The association has in the last year given out four valuable ribbons for different classes of Jersey cattle at the Buffalo County Fair, and has also gotten out a directory of the Jersey breeders of this county. The meeting closed with a very interesting judging contest. There are nearly fifty members of this association now and they are all boosting the Jerseys.

Wisconsin. HARLAN SEYFORTH.

New Connecticut Extension Dairyman

Mr. W. A. Rhea has been appointed to the position of extension dairyman in Connecticut, which was previously held by Karl B. Musser, who resigned to take up similar work in the state of Washington.

Mr. Rhea is a graduate of the University of Missouri and of Cornell University, New York. Since finishing school he has had charge of dairy instruction in the University of West Virginia.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

"It'll Come Out All Right"

When there has been a week of rain,
And then another one or so,
As if no sun would shine again,
And Noah's flood was in a flow.
When life, beclouded, dark and gray,
Is more blessing than a bliss,
And worry clutters up the day
With woes the other fellows miss.
My only star, my brighter word,
Is centered in the lowing herd.

Whatever else may come to pass,
The dairy dividends are sure.
The profits on each bonny lass
Make up for much we must endure.
They go right on, in rain and shine,
Through trouble and through happiness,
Whatever little ache is mine,
They balance up the sheet I guess.
Small wonder, heart and pulse are stirred
When thinkin' of the busy herd.

I come back blue, from trips in town,
This war talk has its ugly side:
And there I stand and grunt and frown,
With morbid thoughts I cannot hide.
But, purty soon, my dim eyes see
A pasture, shining in the sun,
Some brown forms, and an apple tree,
And fields where little rivers run.
And all those doldrums seem absurd,
I have my herd, I have my herd!

"What can you do to keep cows from kickin' while you are milking them?"

"Well, stranger, you could read them the latest war news, or sing Annie Laurie, or rig up a movin' picture show, but I keep 'em so busy thinkin' of the good food they're eating that they don't remember to kick."

The old oaken bucket used to hang in the well until some gol ding motorist cut th' rope and took it to fill his radiator.

Far from solving the labor problem, the farmerettes that move out on farms, stay just long enough to make our boys fall in love with 'em and then both beat it back to the city.

Thoughts of the Oldest Dairyman

Most men haven't any idea of what patience means. Ever watch a spider waiting for a lush young fly?

You could get along without a cream separator just as well as you could get along without cream, but why mix up with the kind of man that sees soldiers passing and thinks it's still th' Civil War.

There's one sure sign that times are advancing—th' chaps that illustrate farm journal ads have quit drawing farmers with long chin whiskers.

If Mr. Hoover asks me to cut down on my grain as feed, you can bet your last dollar that there'll be a mighty hungry peacock struttin' around by next August.

The One Thing He Learned

"Been up to the farmers' college, Zeke?"

"Yep, spent a week there."

"What ye learn?"

"That ye can't beat one uv them wheels uv chance, that buttered popcorn is bad fer th' digestion, an' thet them Circassian ladies takes their hair off after workin' hours."

Playing Safe

"Sam, why do you always take off your hat when you pass the lot where I keep that big red bull of mine?"

"Kaze why, Suh, Mistah Henry, any bull dat kin do whut dat bull did ter three er my wust enemies, deserves respec.' "

"Slipping" not "Saving"

"I kept slipping back two feet every time I went ahead one." That's what the small boy gave as an excuse to his teacher for being late for school one winter day.

And that's just what is happening to the cow owner who is trying to get along without a cream separator or with an inferior or half-worn-out machine. Like the small boy he is "slipping." He thinks he is thrifty, but for every dollar he saves by not buying a De Laval he loses two through not having one.

It *isn't* economy to do without labor saving and money saving and food saving machines. It *isn't* economy to feed 40-cent butter to the calves and hogs.

It *is* economy to buy and use only the best cream separator made—and that's the De Laval.

Viewed from every standpoint—clean skimming, ample capacity, ease of operation, freedom from repairs, durability—there is no other cream separator that can compare with the De Laval.

It's real thrift and genuine economy to buy a De Laval Separator NOW.

Why not see the nearest De Laval agent at once! See a new 1918 De Laval machine for yourself. Try it to prove every claim made for it. If you don't know a De Laval agent write direct to one of the addresses below.

The De Laval Separator Co.

Important Alfalfa Winter-Killing Precaution

L. F. GRABER, Wisconsin

IF you have a good stand of alfalfa and want to keep it good—don't cut or pasture it after the first week in September. This applies particularly to the eastern and north central states where winter-killing is a serious problem to be contended with. Alfalfa requires a growth of eight or more inches to hold the snow for winter protection. More than one good field has been entirely or partially winter-killed because it seemed such a waste to leave that much growth of valuable alfalfa uncut. Even though you only get two cuttings this year, do not take the third unless you can get it before September 5th. You may need the hay this winter but you will need it just as badly next year. A good alfalfa field produces hay which commands the highest market price. Does it pay to take a chance on "killing the goose that lays the golden eggs"?

Late Fall Cutting Reduces Next Year's Yields by One-Half

Here's what happened on the Wisconsin Experiment Station Farm last winter.

In the fall of 1917 the upper half of our five-year-old experimental plots was cut on September 25. A fall growth of 12 to 15 inches was left on the lower halves of these same plots. This spring and all summer long you could see to the very line the difference in the stand and growth of the alfalfa where it was and was not cut late the previous fall. The upper half of each of these plots was decidedly thinner—shorter in growth, weedier, and yellowish in color. It had been weakened and partially winter-killed by late cutting and has not as yet recovered from the shock. This season's yields will warrant your most careful consideration.

Late fall cut half of the plots of common alfalfa (first cutting) averaged 1,620 lbs. of weed free, field cured, alfalfa hay an acre compared with 3,300 lbs. for that which was not cut after September fifth the previous fall, a reduction in yield of over 50 per cent. With the second crop late fall cutting reduced the yield 35 per cent.

With the hardier Grimm and Baltic alfalfas this unwise practice did not cause such a serious loss but even these sturdy varieties suffered considerable reduction in vigor of growth and yields. The late fall cut portion of the Grimm and Baltic plots, (first cutting) averaged 3,720 lbs. of weed free, field cured alfalfa hay an acre, compared with 4,680 lbs. for that which was not late fall cut—a very pronounced difference, when measured in the dollars and cents of present hay prices. With the second crop late fall cutting reduced the yield 11 per cent.

A Cure for Blue Grass Troubles

To be sure, the avoidance of late fall cutting is not a guarantee against winter-killing, but it does often spell the difference between failure and success in maintaining good stands of alfalfa. How very often we hear that alfalfa is not adapted to the middle west and eastern states because blue grass crowds it out. Nine-tenths of the blue grass troubles are the result of winter-killing, either from a late fall cutting and pasturing, or the use of tender strains of seed or both. With proper soil conditions, preparation, and treatment, a good, thick stand of alfalfa will not become infested with blue grass until winter-killing thins out the alfalfa and gives the blue grass a chance to creep in. A good field that becomes 50 per cent winter-killed will appear full of blue grass the same spring. The natural conclusion which follows from the sudden and abundant appearance of this valuable pasture grass is that it has crowded out the alfalfa and taken possession of the soil. Has it? Yes, it has taken possession of the soil occupied by dead, winter-killed alfalfa plants which if alive and vigorous would hold their own against the most aggressive invader of our alfalfa fields. This fact is well illustrated in the alfalfa experimental plots of the Wisconsin Experiment Station, where the five-year-old plots of Grimm and other hardy varieties are today practically free of blue grass while the plots of common, immediately adjacent, which have partially winter-killed are full of blue grass.

Hardy Varieties for Permanence

The growing of such hardy varieties as Grimm, Baltic, and Cossack alfalfa and the avoidance of late fall cutting and pasturing will in a large measure solve our winter-killing problems. To be sure, no alfalfa is absolutely winter-proof. But it is a fact that true, genuine Grimm, Baltic, or Cossack alfalfa will live through winters where the common ordinary alfalfa from western states may kill out so badly that plowing up is essential. It is very important to remember that it is just as hard to get a stand of Grimm alfalfa as it is with common but after you once got a stand of Grimm, it lasts. Hardy alfalfas need exactly those same soil conditions and treatment as are necessary for the common types.

Lime, inoculation, and manure,
Make alfalfa doubly sure,

applies to Grimm and other hardy strains just as emphatically as it does to common alfalfa.

The greatest difficulty that obtains with hardy alfalfa is to secure true, genuine Grimm, Baltic, or Cossack alfalfa seed. There may be seed offered on the market under the name of these hardy varieties that is nothing more or less than common alfalfa. Substitution, adulteration, or misrepresentation are readily possible, for no one can distinguish between seed of these excellent varieties and common. It is indeed unfortunate that such a handicap should exist. On the other hand, there are reliable alfalfa seed growers' associations, as well as large individual growers of true Grimm, Baltic, and Cossack, whose seed can be relied upon and whose honesty and integrity for square dealing is unquestioned.

TWO AYRSHIRE COWS OWNED BY SOUTH FARM, OHIO

On the left is Lessnessock Joan who recently completed a mature record of 14,488 lbs. milk, 592.58 lbs. fat. She has two previous records; as a two-year-old, 12,374 lbs. milk, 511.7 lbs. fat; and as a three-year-old, 13,595 lbs. milk, 565.9 lbs. fat. She is a half sister to Lessnessock Buntie, exchampion two- and three-year-old.

On the right is Foxten's Myrtle Beppo whose mature record, lately completed, is 14,653.6 lbs. milk, 534.42 lbs. fat.

A third cow on South Farm, Moss Rose of South Farm, has finished a production of 13,541 lbs. milk, 472.32 lbs. fat.

Picardy—And The Farm

I

WE'VE fought like fiends along the line of blood and death today,
And never, since the first of it, home seemed so far away.
Dawn filled the sky with sun and shell; the barren land between
Stretched endlessly, without a sprig or blade or leaf of green.
We closed our eyes, my pal and me, and both thought back awhile
To other fields and other hills where summer beauties smile.
I think we both could see the farm—could breathe the clover-air,
And feel the warm, sweet, wine-like breeze that always whispered there.

II

"I wonder what they're doing," Jim, my pal, was whispering,
"It's milkin' time! I hear th' cows—th' bells upon 'em ring."
"You fool!", sez I, "it's fightin' time—you hear a telephone;
They're mapping out a new barrage to give th' twilight tone."
But I was dreaming, too, I guess—I thought I heard a bell,
And home-bound feet that trudged along a little leafy dell.
And all the shell-torn miles grew bright because of memory
That brought a vision of a home and peaceful herd to me.

III

"Just now," sez he, his 'fag' agleam, "they're comin' down th' lane;
Th' dog is runnin' on ahead—it's dampish, after rain,
Them plum trees, over by the lot, are glistenin' an' bright.
Say, boy, the old place, just at dusk—it was a purty sight!"
I lit my fag from his and grinned and got my gas-mask out;
"That ain't no clover what you smell," I sez, "It's gas about.
And, as fer rain, I hope it won't—the mud is bad enough!
I hate like sin to fight th' Huns while wadin' through that stuff!"

IV

And when th' spring came over France and flowers bloomed a bit,
Jim used to crawl outside th' lines fer them and risk a hit.
He'd wear a poppy on his coat—a purple iris, too,
And smile at them, through dust and mud and things they shot at you.
"We have them little purple flags back home," Jim used to say,
"I wonder if th' meadow paths show golden rod today."
"Forget it, Jim," I always cried, "hold down your foolish head;
The Hun is sowing seeds of strife in this here garden-bed."

V

And then—one evening, just at dusk, they brought Jim down the line;
His poor, limp figure tóld th' tale—that home-sick pal 'o mine!
And, somewhere "West" of trench an' guns we gave Jim back to God—
His poppies on the little mound—his iris on th' sod.
It was a pretty, quiet place, for Flanders hills are fair,
And to his left an old church stood in benediction there.
But, best of all, the slope was green with grass and willow trees,
The things Jim loved were 'round about, in case a dead man sees.

VI

Since then, it's been the same old life of conflict and of gun;
Of battles that we love to fight—of trenches lost and won.
The Flanders fields are khaki-hued—and still the legions come,
And still the dear flag sings our souls when lips of us are dumb.
And I will ever think of Jim as one, who, facing death,
Could see the grazing herds at home—could catch th' violet's breath.
No barren waste of shell-torn land, but what gave back to Jim
The little, simple, homely things that farm life meant to him.

—*W. Livingston Larned.*

Louisiana Dairymen's Co-operative Association Incorporates

HOARD'S DAIRYMAN:—At the recent annual meeting of the Louisiana Dairymen's Association, policies were adopted which, if carried out co-operatively, will greatly enhance the value of the dairy industry of this section. Over six hundred producers ship their entire output of milk to New Orleans. In the past there have been two factions, each, seemingly, working against each other and all of them antagonistic to the consumers and city distributors. Indications are now that all differences have been cleared up and the dairymen will get down to work in a business way to bring about more friendly relations between farmer, dealer, and housewife and also do something for the good of the industry as a whole.

There was a large attendance at the meeting, with no display of unpleasantness or wrangling over any phase of the dairy and milk situation. The Louisiana Dairymen's Co-operative Association, Incorporated, was organized to take the place of the old association. Authority to incorporate is granted under the Clayton amendment to the Sherman anti-trust law and the Johnson co-operative association law recently enacted by the Louisiana legislature. The board of directors has absolute power to fix the prices at which dairy products shall sell and do it within the law. Heretofore the dairymen have had to take what dealers were willing to pay. Indeed the producers have been compelled to resort to some strong practices in order to obtain a living price for milk. It is believed the price question will solve itself as the new association gets into operation because everybody realizes that

(Continued on page 166)

Carterville Jersey Breeders' Association

E. M. CLARK, Illinois

THE betterment of the dairy industry depends upon many factors which are within the control of the dairyman. Good cows, intelligent feeding, and proper herd management are all essential in profitable dairying; but if any permanent improvement is to be made in the production of milk and butterfat in the future herd, all the foregoing factors are good for naught, unless a good dairy bull is used. By a good dairy bull is meant a pure-bred sire of one of the recognized dairy breeds of cattle, which possesses good individuality and is the offspring of high producing ancestors. If "like begets like or the likeness of some near ancestor", it behooves every breeder of cattle to obtain the use of the best bred bull that circumstances will permit.

Pure-bred bulls from cows producing large quantities of milk and butterfat are higher in price than grade or scrub bulls. Dairymen with small herds do not usually feel justified in investing much capital in a bull. As a result many scrub and grade sires are used. Even though a good bull is used, it will be necessary to dispose of him after two years' service in order to avoid in-breeding and, in most cases, the bull then goes to market. Many good bulls have been sent to the shambles long before their period of usefulness was over and before their real worth as sires of good daughters was determined.

A dairy bull association is an organization for the purpose of co-operative ownership of pure-bred dairy bulls. The bulls purchased by the association are distributed among the members in different territories. Each territory is called a "block" and one bull is assigned in each "block." At the end of each two years the bulls in the various "blocks" are exchanged to prevent in-breeding; that is, for instance, if there are four "blocks" in the association, each of the four bulls serves two years in each "block," thus making the period of usefulness of each sire eight years. This method of management reduces the investment per member to a very low figure, and makes it possible to know the value of each sire before it becomes necessary to dispose of him.

The farmers in the vicinity of Carterville, Illinois, saw the advantage of a co-operative dairy bull association back in 1916, so they formed what is known as the Carterville Jersey Breeders' Association.

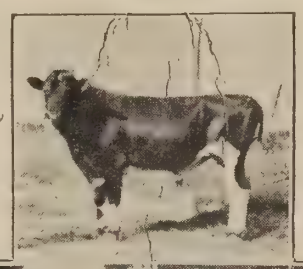
The farmers who joined were sectioned off in five breeding blocks. Five pure-bred Jersey bulls were obtained and one placed in each breeding block.

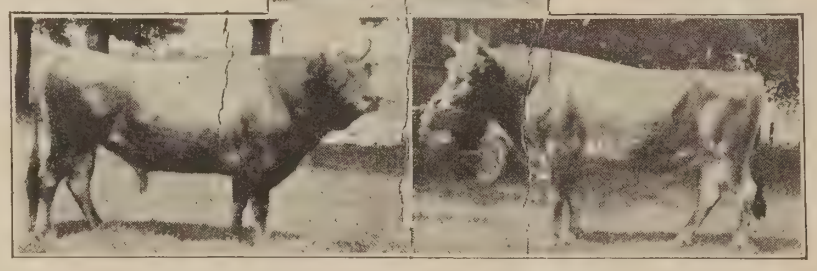
In this community the herds are small, averaging about six cows. Jersey blood predominates, although there are several cows which do not show much dairy blood. There is a total of about forty head of pure-bred Jersey cows in the association which will undoubtedly serve as "seed" for an increased number.

At present the results of the efforts of these dairymen to better their herds are being felt. There are a large number of fine Jersey heifers resulting from the use of these good bulls. So soon as these heifers begin to freshen there should be an increase in the milk and butterfat production per cow in the Carterville community.

Some of these dairymen in co-operation with the University of Illinois Dairy Department will soon begin to keep production records on their herds. When the heifers freshen, milk, butterfat, and feed records will be kept on them in order to compare their production with that of their mothers.

The Carterville Jersey Breeders' Association is the first co-operative bull association in the state of Illinois. It is meeting with such splendid success that from this small beginning it will not be long before Carterville is known far and wide as a Jersey community where high class stock is raised.





JERSEY HEIFER CALVES SIRED BY THE PURE-BRED JERSEY BULLS IN THE CARTERVILLE, ILLINOIS, BULL ASSOCIATION

Records will be kept when they reach milking age and a comparison will then be made of their production as compared with that of their dams.

Value in Milk Producers' Organizations

HOARD'S DAIRYMAN:—The usefulness of organization is illustrated in the milk prices for the season and the inferences that may be drawn from them. For the six months, April to September inclusive, the dealers offered for the season the following prices: April, $2.25; May, $2.00; June, $1.60; July, $2.00; August, $2.25; September, $2.50. This is an average of $2.10 a hundred pounds and is for three per cent milk. The prices that have been obtained are as follows: April, $2.50; May, $2.46; June, $1.80; July, $2.25; August, $2.70; and September, $2.90. This is an average of about $2.42 or some 32 cents above what the dealers thought they would pay. Now if you can imagine what the dealers would have thought right for them to pay, had they known that there was no organization to deal with, it will be easier to determine the worth of organization. It is an easy guess that the price under such conditions would have been a lot lower.

THREE OF THE FIVE PURE-BRED JERSEY SIRES OWNED BY THE CARTERVILLE, ILLINOIS, JERSEY BREEDERS' ASSOCIATION

For the most part I think that dealers are glad that we have organized. Not so much because we get higher prices than otherwise, but for the reason that they deal with a body rather than with individuals. Moreover, they have known for a long time that farmers did not get enough for the milk. I have had them tell me so. They want and have wanted all along a good profit for handling the milk, but if they could get that they did not care how much they paid for it. For example, a few years ago the Bordens decided to pay extra for a couple of months for milk. They expected to charge more to consumers. They made the experiment and every paper in the city raised a cry against them. Other dealers were ready to follow the Bordens, but when they saw the cut in the trade that resulted from the act the others did not follow and the Bordens had to abandon the idea. The better dealers have decided to work more in harmony with the League I am sure. It is true that I am taking their statements in this, but conditions warrant accepting the truth of the statements. Organization has made it possible for dairymen to be heard and for them to get the prices needed by enlightening the consuming public on costs and the necessity for better prices. Let us keep our organization intact and strengthen it in every way possible.

In my home town we have another illustration of the worth of organization. Some may remember my account of the seven dairymen who bought a house and lot by the railroad last fall. We got the co-operative organization formed and it took over the property as we planned. Some of us thought we should go further and put up a building so that we might be fortified against trouble with the buyers of milk. Others said there was no danger and the fact that we had a beginning would deter any attack on us. It did not so prove out. Early in July we were told that we could not sell milk to them after the first of August. We were organized however not only as a League, but as a co-operative association. We went to work at once and raised money and bought a fine creamery building, rented it to one of the largest milk dealers, and on the first of August had some 35,000 lbs. of milk going right in there. Moreover, we were getting League prices and getting good interest on our investment in the creamery. More about this later. Organization did the deed.

The various experiences that we have in organization, especially when we get out of a tight place nicely, strengthens our organization. The concern that had been buying our milk became arrogant and seemed to have set out to destroy us as an organization. Indeed they are reliably reported to have said that they had the League right where they wanted it. They decided to divide the members and take on a part and leave the workers without a market for their milk. Only a half dozen or so remained with them and a part of those have decided for one reason or another to abandon the fight and have come with us. Now the company admit that they want milk and are willing to pay for it. It is doubtful if they can get much from the League members after the experiences of the past month. Even those who would be taken on refuse to go against the organization. It was a badly advised stunt of the dealer and was abetted by some of the village people, one of whom owns a farm and sells milk. It has placed both in bad repute among farmers of the vicinity.

Organizations among milk producers seem to be quite strong whether about New York, Boston, or Philadelphia. I have heard of disaffection in some sections but there appears to be little ground for the reports. The strength lies in the members, of course, but it looks now as though there may have been fortunate selection of officers. Not that the ablest have always been chosen, but men who are for the most part honest. Some think that there has been a desire to get salaries beyond the ability to earn in certain cases and this may be true, but we have so far heard of no overt actions that were tinged with absolute dishonesty. We know of few statements relating to financial conditions and it is claimed that such statements should not be made public. To this I cannot agree but that may be because I do not understand the situation as well as I should. Really I do not think that it is altogether the changed attitude of the rank and file or the exceptional ability of the officials in any of the organizations that have made organizations stronger than in the past. It seems to me that the opportune moment arrived and that advantage was taken of it.

It is by no means impossible that such organizations as the Dairymen's League will go to pieces some day, but as the time goes on there is less liability for it to fall to pieces. Here and there we find some trouble of course. There is a case of a creamery in Vermont I am told that is in Boston territory but which is shipping milk to New York. The buyers maintain that it is not under either organization, and they simply pay just what they feel disposed to pay and that is much less than organization prices. This illustrates the usefulness of organization and at the same time shows that it is possible for the dealers to get in a wedge here and there. Condenseries have been closed or part of the milk refused and there is another wedge. These breaches will have to be closed in some way or organization will suffer. In one case a condensing concern was operating three sub-stations. They gave notice that they would not take the milk longer from the League, but they went into the territory and offered to take the milk if the farmers would pay a generous bonus for transportation. In this case the League came off victorious as they immediately sold the milk to another concern. The former buyers made complaint but the deal stood. It is still a game and the victories are not all on one side.

I have been asked why the Bordens, for example, desire to open new creameries in some localities and close them in others. We must remember that there are now two Borden concerns. Both are undoubtedly supported by the same money but are under distinctly separate management. One is a condensing concern and the other sells milk in the cities in the fluid form. They closed one large condensery not far from my home and at almost the same time opened other stations to take in milk for the city trade. Why not take milk from the locality where the condensery has been operating? There may be more to this than appears on the surface, but it is understood that condenseries are closed because they can

(Continued on page 174)

Organizing for Feed Defense

SANDERS SOSLAND, MISSOURI

VIII. CORN AND OATS PROSPECTS

CAREFUL consideration must be given corn and oats in studying the general feedstuff situation, or the probable trend of prices and supply of any particular feeding commodity. Too little attention has been given corn and oats in the past by co-operative dairy feed purchasing organizations. These coarse grains wield a tremendous influence in the general feedstuff situation. It is often possible to forecast with some degree of safety the outlook for any particular feed by giving close study to corn and oats. For this reason, war feed community purchasing organizations must not overlook these two commodities when seeking light on feedstuffs in general.

Unless some unusual condition develops, all the products used in rations for live stock have a normal relation with each other. Generally corn is the basis of values. In this respect, oats ranks next to corn; in fact, when studying the general feed market situation, attention must be given to both corn and oats. For instance, corn sold at unprecedented levels last year, for a time even higher than the fixed quotations for wheat, and all other feedstuffs were then at the highest mark in history. Similarly, the decline in prices for corn and oats —the latter grain feed usually follows a course sympathetic with corn —was the prelude to a relative downturn in other feedstuffs.

Unfortunately, prospects for the corn harvests, which on July 1 gave promise of a crop of 3,160,000,000 bushels, the greatest crop in the history of the country and larger than last year's record production, have slumped enormously. As compared with the July 1 estimate of the United States Department of Agriculture, a decrease of 170,836,000 bushels was recorded in the August 1, 1918, prospect, and in the week following private students of the crop situation declared many, many more millions of bushels of the coarse cereal were lost owing to the severe drouth. On August 1, the Department of Agriculture estimated the final yield, allowing for normal deterioration in the remainder of the crop period, at 2,989,000,000 bushels, compared with the 1917 harvest of 3,159,836,000 bushels. The estimated figures are based on a condition of 78.5 per cent of normal, compared with 87.1 per cent a month ago and 78.8 per cent a year ago. Approximately 113,835,000 acres were planted to corn this year.

Extremely high temperatures, ranging as high as 115 degrees in Kansas, and above 100 degrees in other states of the Southwest, with a marked and almost nation-wide absence of moisture, were the influences of the crop deterioration in the month of July. Since the issuance of the government report on August 1, territory west of the Mississippi river, and even the leading corn states, Iowa and Illinois, have suffered heavy deterioration.

Advices from all parts of the corn growing sections indicate the crop is two to three weeks ahead of normal, which assures maturity before frost. It is remembered that frost resulted in extensive damage a year ago. But moisture is seriously lacking at this writing.

The federal crop observers predict an oats yield of 1,428,000,000 bushels, compared with the estimate on July 1 of 1,436,617,000 bushels, and the final 1917 production of 1,587,286,000 bushels. Most of the oats crop matured before the drouthy period, and considerable of the new grain already is moving to market. It is estimated that farm reserves of old oats amount to 80,504,000 bushels, compared with invisible holdings in the preceding year of 47,771,000 bushels.

In analyzing the trade situation in corn and oats, war feed community organizations must not overlook the demand for both coarse cereals for human consumption. Demand for corn meal and corn flour in the past year was the important influence in the rise of cash corn to a point above the $2-level. For the first time in the annals of the grain trade, prices in the past year reached the highest mark on a crop the greatest on record. The same was true of oats, but to a lesser extent.

Regulations of the United States Food Administration, since the accession of Herbert C. Hoover to the position of food administrator, called for consumption by housewives of an equal amount of some substitute product with wheat flour. Bakers were required to use at least 25 per cent of substitutes, but many bakers, as well as hotels and restaurants, eliminated wheat flour entirely from the table. As a result of this substitution and elimination, vast quantities of substitute products were required. With the housewife and the baker having little knowledge of any substitutes except corn and oats flour and meal, these products were almost generally consumed, thus greatly augmenting the demand for corn and advancing prices. For the first time in history, feeders of cattle and hogs were forced to enter into keen competition with millers who were feeding humans.

Substitution continues but in lesser volume. Housewives are still required to take 50 per cent of substitute and bakers 25 per cent, while complete elimination of wheat products from restaurants and hotels, which was voluntarily agreed upon, no longer is necessary. It is understood the food administration will make less drastic its substitute regulations after September 1, but the extent of the probable reduction is not known. However, war feed community organizations can safely rely upon a much smaller human consumption of the coarse cereals. A great wheat crop lessens the need for substitution. Millers of flour already are clamoring for a change in the substitute regulations, declaring they can easily supply the crop year's domestic demand with mills running less than two months.

Corn and oats have advanced sharply on account of the serious drouth over the entire Southwest, and inadequate rainfall elsewhere. Choice grades of corn are now selling around the $2-level. Oats, as usual, followed a sympathetic course, with prices around 75 cents per bushel. With further deterioration in the prospective corn yield, which seems probable, high prices will doubtless prevail on the coarse cereal. Another important factor in the corn trade is the greatly increased feeding of cattle and hogs in the United States. Demand from feeders will be further augmented by the lack of pasturage in the Southwest and West. Hay crops, too, are short, another important influence.

Owing to the relatively high price of corn, oats have been extensively substituted for the leading coarse cereal. Live stock interests will doubtless continue this practice of economy, especially if the corn crop suffers more permanent damage.

War feed clubs which plan co-operative buying of corn and oats in order to prepare for winter's needs, will do well to enter the market immediately. A glance at market statistics and probable factors brings out practically no "bear" or price depressing influences. Early buying of corn and oats, especially the latter, by war feed community purchasing organizations, seems advisable. And, as the prices of all feedstuffs not regulated depend in a great measure upon these two coarse cereals, the time seems ripe for early purchases of other feedstuffs. In fact, the recent adverse corn crop developments make delay in acquiring feed for winter more inadvisable than ever unless heavy and general rains come very soon and effect a reaction in prices. But the damage to corn is already too extensive for a very sharp reaction.

IMP. MASHER'S GALORE, GUERNSEY SIRE, OWNED BY HARBOR HILL, NEW YORK, NOW SEVENTEEN YEARS OLD AND STILL IN ACTIVE SERVICE

He has 19 A. R. daughters, five of which completed their records during the past year with an average of 13,093.18 lbs. milk, 667.09 lbs. butterfat. Two of his daughters and a double granddaughter are shown on this page.

Cost of Concrete Silo

In his annual report to the Dairy Division, Ben R. Eldredge of Utah gives the following detail of costs in building a 100-ton monolithic concrete silo. The figures are taken under Utah conditions but are applicable to many other sections. The total of $319.35 is said by Mr. Eldredge to be less than the cost of erecting a similar capacity stave silo in Utah.

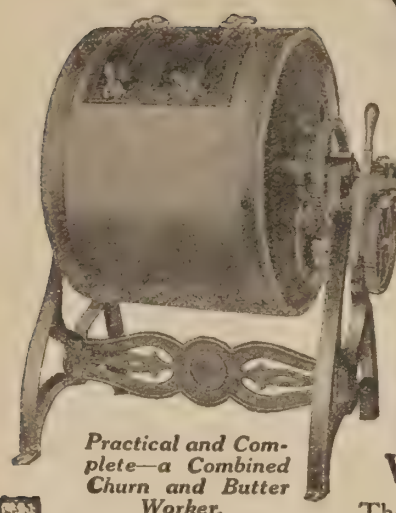
127 sacks cement @ 70c	$88.90	
Rope, buckets, oil, pulleys, and tamper	4.80	
Nails	.70	
Lumber for platform and scaffolding	17.00	
52 ft. 1½ inch pipe	10.05	
34 rds. wire, 36 inches high	17.70	
14 rds. for ladder	4.20	
Tarring	10.00	
Total for material		$153.35
3 men 13 days @ $2	78.00	
4 men and teams 2 days @ $4	32.00	
1 team 3 days @ $2	6.00	
Total for labor		$116.00
Rent of forms		50.00
Total cost		$319.35

"Diligence is the mother of good luck."

"Economy is simply the art of getting the worth of your money."

"If you want a thing done, and done right away, ask a busy person to do it."

Linden Girl of Harbor Hill 3d has a recently completed record in Class CC of 15,032.9 lbs. milk, 785.89 lbs. fat. This places her at the head of the class and makes her champion cow of the breed in the new maternity class. A previous record of 12,636.9 lbs. milk, 681.34 lbs. fat, gave her fourth place in Class F.



Linden Girl 2nd, a daughter of Linden Girl and a double granddaughter of Imp. Masher's Galore, now on test has produced 7,726.3 lbs. milk, 312.56 lbs. fat in Class D in 204 days.

Linden Girl, whose third A. R. record lately finished is 15,819.9 lbs. milk, 785.55 lbs. fat. The three records made in consecutive lactation periods average 14,149.7 lbs. milk, 709.17 lbs. fat. One of these, of 14,682.8 lbs. milk, 747.45 lbs. fat, makes her among the leaders in Class B. She is a full sister to Linden Girl of Harbor Hill 3rd, both being daughters of Imp. Masher's Galore.

Victor Jr. Churn

Practical and Complete—a Combined Churn and Butter Worker.

The Churn That Helps You to Make Firm Butter in the Warm Weather

The **Victor Junior** Churn puts butter making on the farm on a level with creamery butter making. It keeps the temperature down much better than the ordinary churn both during the churning and the butter working.

The mechanism of the churn is such that it will not only churn quickly but will get all of the butter. It also preserves the butter from dust and flies because when the churning is done, the butter can be salted and worked right in the churn. It does not have to be removed until finished.

To get the best butter, the temperature of cream for churning should be from 50° to 60° F. according to the density of the cream. A rich or dense cream requires a lower temperature than a thin cream. Having the cream at the right temperature to start with counts much in producing firm butter of good appearance.

The **Victor Jr.** will do the rest. The drum of the churn is built of heavy, well seasoned lumber. Under average conditions the temperature in the churn should not rise more than a few degrees during the churning and working process. The rolls work the butter thoroughly. It comes out with a good grain and firm.

We make and sell more churns for creamery use than all the other concerns combined so you can depend on our recommendation of the Victor Jr. as the ideal farm churn. It is covered with our iron clad Guarantee.

Full information in our Dairy Supply Catalogue.

Storing Vegetable Crops for Winter Use

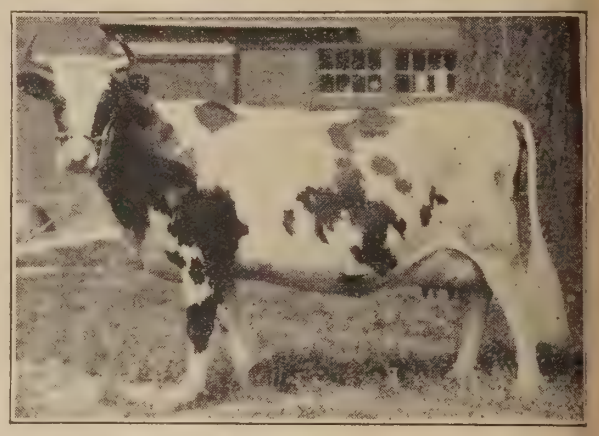
HOARD'S DAIRYMAN:—In times of peace the average householder provides some means of furnishing his table with vegetables through the long winter as well as the summer months. Now that we are at war it is especially desirable that we save all surplus vegetables and root crops. Some vegetables and fruits lend themselves readily to the process of drying and this practice should be followed as closely as possible.

Whatever methods of storage are employed every ounce of foodstuffs should be saved. The questionable condition of freight systems, the shortage of labor just when needed, and the quick spoilage of food crops all make it imperative that some form of provision for the storage of food be planned for before the harvest season is upon us.

Storage of root crops in outdoor pits or banks is the least expensive method and was practiced successfully by our forefathers. These pits or banks are made by digging an excavation 6 or 8 inches deep in a well drained location and are lined with straw, leaves, or material of like nature. The vegetable root crops are placed on this litter in a conical pile. Straw and leaves are then placed over this as a first covering followed by 10 or 12 inches of dirt. The mound must not be completely covered with dirt the first day but should be allowed to sweat and dry out a few days. Precaution must be rigidly observed to protect the mound from rain. As severe weather approaches, an extra layer of soil may be added. Deep drains must be provided until there is no danger of moisture soaking through into the bottom of the pile of vegetables. The question of ventilation is important. Small pits that contain but a few bushels of vegetables will receive sufficient ventilation if the straw between the vegetables and the earth covering is allowed to extend through the latter to the top of the pile. This exposed straw should be covered with a board or piece of tin held in place by a stone as a protection from rain. In the larger pits ventilation can be secured by placing two or three pieces of rough boards up through the center of the pile of vegetables so that a flue is formed. This flue must be capped by an inverted trough made by nailing two pieces of boards together at right angles.

As it is somewhat difficult and precarious to open these pits and close them again without injury to the roots nearest the surface, a small number of small pits is preferable to one large mound. Again, in place of storing each crop in a pit by itself, it it better to place a small quantity of several kinds of vegetables in the same pit so that it will be necessary to open only one bank to get a supply of all of them. In storing several crops in the same bank it is a good plan to separate them with straw, leaves, or other material.

When the ground is frozen hard in winter difficulty will be experienced in opening the pits. Several big steel wedges will open the banks easily for as they are driven into the frozen earth it will crack in large pieces and can be easily removed.



Most vegetables suitable for storage should not be harvested and stored until the arrival of cool weather or about the time of the arrival of the first killing frost.

There are a few root crops that respond successfully to the same method of storage. Others require a little different treatment. Among all the various kinds of winter vegetables, the onion stands out by itself for certain conditions at harvest. To keep well, onions must be mature and thoroughly dry. As good ventilation is essential they are best kept in baskets or crates. When so stored they must be placed where it is dry and well ventilated. The attic is a favorite place with many people as slight freezing does not injure the onions.

The Irish potato is one of the important food crops that may be stored successfully in the outdoor pit. Potatoes should be fully matured before digging, have the loose dirt removed from them and left in the sun to dry a little before storing.

The outdoor pit method is one of the best ways of storing cabbage. When pulled up they are left with their roots and leaves on and arranged roots up, three directly on the ground and two above. The row is covered by heaping dirt on it.

Carrots, beets, and turnips require about the same treatment when stored in outdoor pits. These pits should be filled with the roots piled cone fashion covered with leaves or straw, then earth. Beans and peas may be kept for winter use by picking the pods as soon as they are mature and spreading them in a warm, dry place like the attic floor till the beans or peas are thoroughly dry. Then shell and store in bags hung in a dry, well ventilated place till needed. Navy and other bush beans must be allowed to mature on the vines until the greater number of pods are ripe. Then pull the whole plant and cure it like hay. After thoroughly drying, beans may be threshed and stored.

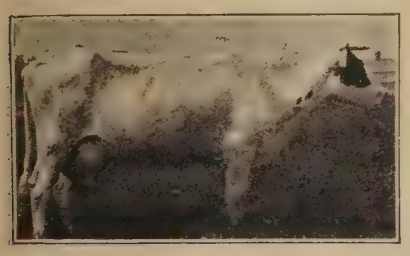
Willowmoor Moss Rose, Ayrshire cow bred by J. W. Clise, Washington, and purchased from him at the 1918 New England Ayrshire Club Sale by Peter Bradley, Massachusetts. This cow has three A. R. records: with the first calf, 7,764 lbs. milk, 364.4 lbs. fat; with the second, 11,699 lbs. milk, 532.2 lbs. fat; and with the third, 17,005 lbs. milk, 714.32 lbs. fat.

Celery may be stored for a time in the position where grown by placing enough earth around the base of the plants to hold them in good form. When the weather gets to the freezing point bank the earth up to the very tops of the plants till they are almost covered. Then as the weather grows still colder cover the ridge with coarse manure straw or corn fodder held in place by means of stakes or boards.

Another way to store celery is to dig a pit 10x12 inches wide to a depth of about 24 inches and any desired length. Loosen the soil in the bottom or shovel in loose topsoil to form a bed in which to set the roots of the plants. Pack this trench with fully grown plants, placing the roots close together with considerable soil adhering to them. Water the celery as it is placed in the trench and allow the latter to remain open long enough for the tops to become dry. Unless the

soil is very dry at the time of storing it will not be necessary to apply more water. Place a 12-inch board on edge along one side of the trench and bank it with the surplus earth. Cover the trench with a roof of boards, straw on poles, or cornstalks from which the tops have been removed. Spread a light covering of straw or other material that will pack closely and increase as the weather becomes more severe. This is a favorite method with many growers of celery.

Pumpkins and squashes are best kept for winter use in the room of the basement or in dry, well ventilated cellars but the best place is a dry, frostproof place above ground. They may be placed on shelves in rows so that they do not touch. If the temperature is maintained at about 40° F., late maturing varieties will keep well throughout the winter.



Salsify may be stored in the same manner as beets, carrots, parsnips, and root crops of this nature. One hard frost does not injure turnips but alternate thawing and freezing does. It is best to gather them before freezing weather and store as the other root crops in the outdoor pit.

Illinois. M. G. DUNN.

St Croix Dairy Picnic

The Holstein, Jersey, and Guernsey breeders of St. Croix County, Wis., met recently in annual picnic at the home of Mr. and Mrs. Franklin Hunt of the Leland Ash farm near Roberts. It is estimated that nearly one thousand people were in attendance.

Choice animals representing the three dairy breeds of the county were

CARRIE PET LASS, HOLSTEIN COW

In June she produced 2,160 lbs. of milk containing 86.4 lbs. fat and was highest cow in the Lake County No. 2 Association, Illinois. She is owned by Rouse Bros.

exhibited by some of the principal breeders of the county. Those exhibiting Guernseys were Lloyd Rundell, Wm. Graham and son, B. L. Rundell, and O. R. Schwalen. Jerseys were exhibited by Leland Ash, Frank Ash, Lloyd Jones, and W. A. Lamb. Holsteins were exhibited by J. E. Rundell, David Imrie, and A. O. Fillbach.

Competing high school teams judged the Guernseys in a contest for a silver cup offered by the St. Croix County Guernsey Breeders' Association. In this contest the high school teams of St. Croix and Polk counties competing were rated as follows: First, Frederick; second, St. Croix Falls; third, Roberts; fourth, Milltown; and fifth, New Richmond. In the general judging, prizes were won by William Ross, Neal Brown, and Howard Jones.

Supt. Robert Lohrie of New Richmond gave a patriotic address in which he briefly reviewed the struggles which were fought for American liberties and urged all true Americans to live up to the examples set by our forefathers. County Agent Thos. M. Olson, who is a valuable factor in promoting good agriculture in St. Croix County, gave a talk on the barberry plant as a breeding place for wheat rust. Attorney George Oakes gave an interesting talk on flag etiquette, and Professor Kraege spoke of the future of the dairy industry in Wisconsin.

Hon. W. C. Bradley auctioned off a draft horse donated to the Red Cross by John Snoeyenbos. The horse was finally bid in by George Graham after which five hundred dollars were added to the Red Cross fund.

Wisconsin. J. M. HAMMER.

Civilization and Milk

HOARD'S DAIRYMAN:—Since the somewhat recent discoveries as to the essential growth constituents that are found in sufficient quantity in butterfat only, quotations from earlier writers are being collected here and there. These help to reinforce the position of milk as "indispensable to the welfare of the human race".

Lewis Henry Morgan, American archaeologist and anthropologist, in 1877, published his book, "Ancient Society". This was in the nature of a philosophical discussion of the progress of the human race from savagery to civilization. The matter of special interest to dairymen is found in his discussion of the reasons for the differing progress of civilization in the two hemispheres, wherein he says:

The Cow vs. Barbarism

"In the eastern hemisphere, the domestication of animals enabled the thrifty and industrious to secure for themselves a permanent supply of animal food, including milk; the healthful and invigorating influence of which upon the race, and especially upon children, was undoubtedly remarkable. It is at least supposable that the Aryan and Semetic families owe their pre-eminent endowments to the great scale upon which, as far back as our knowledge extends, they have identified themselves with the maintenance in numbers of the domestic animals. In fact, they have incorporated them, flesh, milk, and muscle, into their plan of life. No other family of mankind has done this to an equal extent and the Aryan has done it to a greater extent than the Semetic."

This man spent a lifetime in the study of human progress, his first work being a scientific study of the social organization of Indian tribes. Indeed, for several years he lived with them, and was called by the Senecas, "Ta-ya-da-wah-kugh." Although the western hemisphere was in possession of corn, a cereal more important than all others combined, yet it was so far outstripped by the eastern hemisphere that only some remarkable condition could explain it. That explanation was forthcoming only by the cow, and the generous use of her milk which the Aryan family practiced. As members of that family we have inherited the superior wisdom and strength which centuries of persistent use have endowed us with.

As a general food milk has a value double or treble the prices received for it by the producers. Its restricted use would be not only a loss of energy but would be a serious menace to the winning of the war, and to the destiny of the race in general. Let us save and save wisely, but not to the detriment of the greatest factor in our civilization.

Kansas. G. A. MORGAN.

Jersey Cattle Notes

For week ending July 26, 1918:

Number of animals registered: Bulls, 186; cows, 410; total, 596. Number of transfers recorded: Bulls, 139; cows, 461; total, 600.

To the names of the illustrious generals of today, history will justly add General Housewife.

There is no deferred classification in food conservation. We are all in Class I, all in camp, and ready to go "over the top" when we must further conserve.

Little Economies at Siloing

HOARD'S DAIRYMAN:—There are a number of things at siloing time which may seem of minor importance to some but which nevertheless help to keep the work moving along smoothly with as few men as are now available on farms. The few suggestions I am giving here have been of great value on our farm and no doubt many others can use some or all of them to their advantage.

The heaviest work is the handling of the corn from the field to the cutter. As most of our crew consisted of boys between 16 and 21 last year and these boys worked best in handling the corn on the wagons, the corn binder was set to make average sized bundles so they could handle them easily. In the heavier corn the bundles contained four hills or about twelve stalks. This is the most convenient size to handle all around, facilitating the operation of feeding as well as handling in the field, though it takes a little more twine than for larger bundles. The extra cost, however, will be returned in the greater convenience in handling.

Rotten twine is a poor investment. The twine should be strong enough so that the bundles can be lifted by it with the support of one hand underneath. In heavy corn from three to four pounds will be needed per acre if bundles are made average size.

It is much more convenient to have the bundles dropped in bunches of 3, 4, or 5 rather than to have them distributed along singly. This is where the bundle carrier on the binder comes in handy. Do not let more than two men hand up bundles to one driver, for more than two are sure to get in each other's road and the driver cannot handle the bundles fast enough to keep them busy all the time. Where the bundles are dropped in bunches the wagon can be driven close enough so that carrying is avoided. Steps that may be eliminated by some system are useless steps.

In our work a distributor is used inside the silo. This is an extra loose-jointed pipe which is hinged to the blower pipe where it comes over the top of the silo. As this is carried about by one of the trampers the silage is automatically distributed. Practically one man can be saved by this method and the silage can be distributed more evenly than with forks; it also keeps the atmosphere inside freer from dust than when no distributor is used. When water is run into the blower the trampers do not need to wear rubber raincoats. The distibutor is almost indispensable in filling the large diameter silos because of its labor-saving features.

When running water into the silo we put it in at the blower so that it is thoroughly mixed with the silage. For this purpose we have several sections of galvanized iron pipe which is attached to either the pressure system or pump and which runs out to the cutter. Not a drop of water is carried, the gasoline engine taking care of that part in a most effective way, giving a steady stream of any size up to one inch. There is a cut-off at the blower which is turned whenever the cutter stops or starts, thereby preventing flooding of the blower.

Stops are frequently caused by the choking up of the blower pipe. This can be easily avoided in two ways. First, set the pipe as near a perpendicular line as possible and screw the joints securely together, being careful to keep the sections in a straight line. Second, stake the cutter solidly so that the engine belt can be pulled tight and kept running tight. If the belt is so loose as to slip a little when the cutter is being fed heavily the speed of the blower is lessened and causes the pipe to choke. As it takes some little time to unjoint and clean the pipe this precaution is worthy of close attention. The belt should be retightened or looked after several times a day.

We usually have four men in the field handing up bundles and from three to four men tramping and distributing the silage. If at any time the wagons are slow in arriving at the cutter one man is taken from the silo and sent to the field for a while to help the field men catch up.

Another convenience is an outside ladder. This is a permanent steel ladder bolted to the silo. It comes within about eleven feet of the ground, making it easily accessible with a short ground ladder. The ladder is especially convenient when putting up or taking down the blower pipe, and being well secured is not dangerous to ascend.

Indiana. J. L. JUSTICE.

CONCRETE SILO ON JUSTICE FARM, INDIANA

This silo was built and the photograph taken before the barn was erected. It is 12x43 feet, built with five-foot forms, has now continuous, oval shaped doors, a concrete chute, and practically no pit. Mr. Justice writes: "We have put three crops of silage in it and I do not see how corn can keep any better than it does in this concrete silo."

The Allied Sugar Bowl

We have been able to tide over times of great difficulty and today the acute food crisis is past. There will be a better loaf for the allied nations and greater meat supplies.

That those who dare all must share all is the growing conviction of America. In fact, as the President said, speaking of the allied nations, "We are eating at the common table with them." Although there are some individual sugar bowls scattered here and there on this table, the family bowl into which America and the Allies must dip in the Western Hemisphere; for Java is out of reach, and the beet fields of Europe either lie inside the German lines or their production has been cut down by German invasion.

The Honor Ration

A careful survey of the sugar situation has promoted the Food Administration to drop the individual sugar ration from three to two pounds a month. Two pounds per person for household purposes will put us on a level that England tries to maintain. The French ration is one and one-half pounds and the Italian one pound; but it is not always possible to assure these quantities.

This honor ration, with the additional allowance for canning, can be made to go around; and when our people understand the "whys" they will be willing to put the sugar campaign through with the same spirit with which they tackled wheat.

The New Sugar Crop

Those who recall the sugar shortage last fall know that before the end of the year there was a practical exhaustion of supplies in home, store, factory, and bakery, leaving little carry-over as a starter for 1918. The mere filling of this void took up most of the surplus of new sugar coming in. Then, too, the production from the American beet and Louisiana cane crops has been disappointing and the yield in Porto Rico has likewise been smaller than anticipated.

The imperative call for ships for the movement of troops and their supplies has materially reduced the amount of sugar from distant sources. Added to this already difficult situation, the quantity needed by the army and navy greatly exceeds earlier estimates. There must be no counting of spoonfuls for our troops or holding back even on the candy they want. The best we have and all we have is not too much to offer them. Remember, that for soldiers on the battle front sugar and candy are by no means a luxury as they are to a large degree with us at home. Sugar is necessary for them to supply the energy they must quickly gain for the heavy work of fighting.

We find also that an increased amount of sugar must be sent to France and Italy to take the place of that lost as a result of the German and Austrian invasions, during which much beet land was overrun and many factories destroyed. Under agreements we are to supply certain quantities of sugar to neutral nations; and, finally, over fifty million pounds were lost recently through submarine sinkings off our Atlantic coast. To sum it all up, we must accept the situation and push on to victory.

Most of the industries using sugar have had their supplies cut in half; and the situation is so serious that only the utmost conservation will pull us through. Women are urged to go ahead with their canning, sugar or no sugar. Fruit can be canned with the hot water pack or fruit juice pack and sweetened when opened, or cooked to a pulp, canned and made into jam later. This is a little more trouble, but every American woman wants to share in the great work of building up the food reserves, for reserves mean victory. Each jar on the home shelf frees another commercially packed can for the army. Save the fruit crop! It will not be easy, but it must be done.

Why a Shortage

The first beet sugar will reach the market in October and will continue to arrive until the end of the year. This sugar will probably not be distributed further east than Buffalo. Louisiana cane will commence coming in about the middle of November and the Cuban crop about the middle of December. This sugar comes on the market gradually and the distribution is necessarily slow.

America, faced the wheat crisis, cut household consumption to 50 per cent of normal, and exported 141,000,000 bushels of wheat. This wheat was the salvation of the Allies, and each individual who helped has the right to the consciousness of duty well done. What has been done with wheat can be done with sugar.—U. S. Food Administration.

Present Supply of Dairy Products

Dr. H. L. Russell, in his address before a meeting of representative dairymen held in Milwaukee, Aug. 7, gave some very interesting statements regarding our present supply of dairy products. Dr. Russell has been serving in the United States Food Administration for the past year, and this has given him unusual opportunities to know about our supply of foods and the necessity of a large reserve. We print the portion of his address which pertains to the supply of dairy products:

What are the facts today as to existing supplies of dairy products? Last spring when there was a considerable surplus of dairy products in storage, the feeling gained ground rapidly that the future of the dairy industry was seriously imperiled. Many dairymen came to Washington and stated that unless something was done immediately, hundreds of thousands of dairy cattle would be sacrificed, and dairy products would become a drug upon the market. What are the conditions we find at the present time?

Butter

Take, for instance, butter, how much have we now compared with that which was in storage a year ago? On July 1 of this year there was 66,000,000 lbs. in storage as compared with 67,400,000 lbs. a year ago, or 1.6% less than the same time last year. Our exports for the year just closed are less by almost 10,000,000 lbs. than they were for the previous year. Reduction in export has, of course, been due in large measure to lack of transportation, due not only to the development of the submarine warfare, but to the use of boats for men and ammunition rather than for carrying these food products.

Cheese

The same situation has developed with reference to cheese. It will be recalled that last year the storage houses were full of cheese and last winter it was thought that it would be impossible to dispose of this product satisfactorily,. On October 1, 1917, there were 92,500,000 lbs. of cheese in storage, and it was thought that grave danger faced the cheese industry. This large oversupply has been consumed during the season. On July 1, 1918, we had only 30,800,000 lbs., as against 34,100,000 lbs. on the same date of the previous year, or practically 10% less than we had a year ago. Exports of this product have also increased rapidly during the last four years. In 1913 and 1914 we exported about 2,500,000 lbs., while in 1916 this had jumped to 44,000,000 lbs., and in 1917 to 66,000,000 lbs. England alone took substantially nine-tenths of all of our cheese exports.

Condensed Milk

The same situation obtains with reference to condensed milk. Last winter the price of condensed milk reached its very highest point. This was due largely to the fact that Great Britain bought condensed milk at almost any price, many factories selling their product as high as $10 a case. This was before the development of the Allied Purchasing Committee. This led to a very rapid increase in the number of factories producing condensed milk, the total number having been doubled substantially in the last two years. The result of this stimulus led to an accumulation of stock which was still further increased by the interference with transportation. The result was that many thought the condensed milk business this spring was on the verge of ruin. A number of the condenseries situated within the milk supply zones of cities where the cost of production was higher than normal, have been forced to close down, but as a matter of fact, the enormous accumulation of condensed milk in storage warehouses has practically disappeared. There is being shipped at the present time about 670,000 cases a month, and the demand for the product cannot be fully met. The price of condensed milk in the last thirty days had advanced $1.00 a case. The price in August was $5.50 as compared with $4.40 for the month of June. You will see from this that the condensed milk situation has worked itself out entirely, and governmental authorities are now looking forward to ascertain where it will be possible to secure larger quantities of condensed milk than the present supply will permit.

War Needs First

These are facts that must be taken into consideration in determining the wisdom of putting on any campaign of advertising which is going to stimulate consumption. In any case, one must figure upon meeting the home demand as well as the export needs, and under existing conditions, while we are at war, it is essential that we look upon this matter in a different way from what would ordinarily be the case under more normal conditions. This nation is now at war, and we should see to it that we lend all possible assistance to those of our allies who are now fighting our battles. This means that we must not only supply them with armies and munitions, but we must also furnish them with those sinews of war which alone can solve the struggle. This means that food for the allies must always be kept uppermost. The case is particularly exemplified in the situation with reference to sugar.

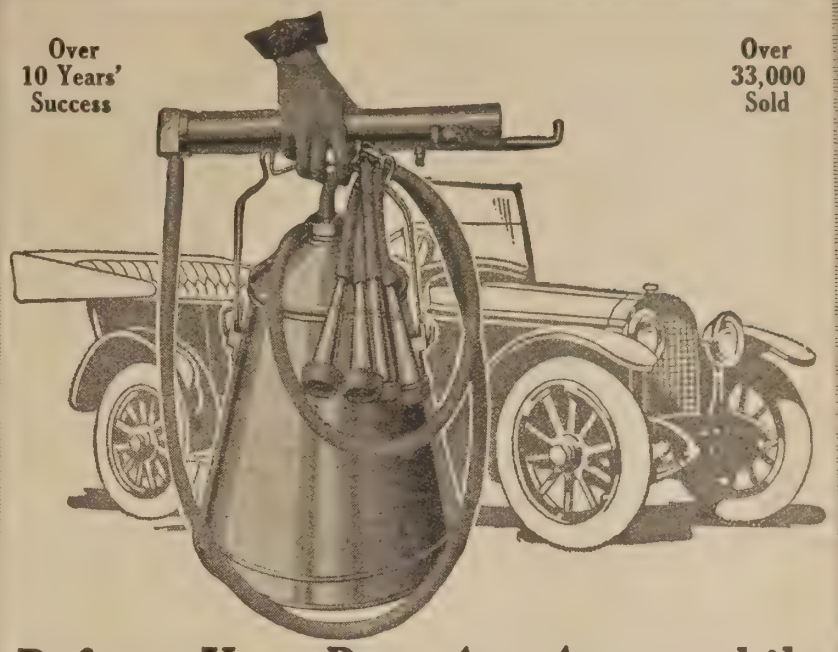
Chicago September Milk

HOARD'S DAIRYMAN:—During the month of September, milk producers in the Chicago district will receive $2.92 per hundred pounds for their product. This price, which is an advance of 17 cents over the August rate, was recently decided upon at a meeting of the Food Administration held at Chicago, to set the regular monthly price

The advance in price to the producer will mean higher prices for the consumer. Milk will retail in the cities at 13 cents per quart or one-half cent higher than previously. At the cash and carry stations, a charge of 11 cents will be made instead of 10 cents as in the past.

W. E. Lamb, attorney for the milk division of the Food Administration, stated that the retail price of milk to the consumers would not advance above the 13 cent market unless unexpected conditions arise to make a higher rate necessary. This means that the dealers will most likely figure a smaller proportion of profit during the remaining months of the year, because the price to the producer is scaled to advance as the year progresses.

Illinois. J. M. CARROLL.



Join Food Administration

Dr. W. R. Dodson, Dean of the College of Agriculture of the University of Louisiana, and E. S. Brigham, Commissioner of Agriculture of Vermont, are new members of the Food Administration staff in Washington. Dr. Dodson has charge of problems of interest to both the Food Administration and the Department of Agriculture. Mr. Brigham will head the butter and cheese section.

Dean H. L. Russell of the College of Agriculture of the University of Wisconsin, who has rendered exceptional service to the Food Administration in the capacities which Dr. Dodson and Mr. Brigham now assume, has been recalled to Wisconsin by pressing duties at the University.

Over 10 Years' Success

Over 33,000 Sold

Before You Buy An Automobile

you make a careful study of the different machines you can buy for a given amount of money.
That's what you should do in selecting a milking machine. Your choice, according to merit, will be the

HINMAN MILKER

Like the best automobiles, it is made of the best material by skilled workmen. It's design has been proven by more than 10 years' success. Its simplicity means low first cost and low operating expense.

Write for Our Big FREE Catalog

and learn about the experiences of prominent dairymen and profits they are making since using the HINMAN Individual Pump, Valve Chamber Milker. Even if you milk only six cows the HINMAN will be a big factor in helping you buy your automobile.

Hinman Milking Machine Co.

Mr. R. L. Hinman offers you this catalog FREE.

Universal natural milker

Alternates, Like Milking With Hands

Read What This Farmer Has to Say:

June 25, 1918

Gentlemen:

I have been using the Universal Milker since last March.

I was very skeptical about using a milking machine on my good dairy herd, but will say frankly that after this experience, I would purchase another even if it cost $1000.00.

(Signed) A. M. SEYMOUR
Copenhagen, N. Y.

More Milk—Less Labor—Increased Profits

Feed is up, help is scarce, but you can save labor and cut your costs with The Universal Natural Milker on your farm.

Hundreds of other farmers find true satisfaction and genuine economy in the Universal. Why not you?

This is because of its special features.

The Universal milks *nature's* way. It alternates, milking two teats at a time, while it is massaging and relieving the other two, and imitates nature so closely that,

—It means more contented cows

—And more milk in the pail.

That counts!

The Universal teat cup fits all cows. There is no bother—no adjustments to make.

You need buy *only one* Universal—it lasts a life time.

It is simple, dependable and always ready to work.

No holidays, always on the job at milking time.

Put Universal to work on your farm today. Increase your profits.

See our nearest dealer or write us.

The Universal Milking Machine Company
402 Mound Street, Columbus, Ohio

EDITORIAL COMMENT

LIBERTY bonds are the best security in the world. No form of investment is safer. But in view of this, it has been reported on good authority, according to The Rural New Yorker, that during the past year nearly $500,000,000 of fradulent stocks and bonds have been exchanged for liberty bonds. The liberty bonds bear only 4¼ per cent interest and the worthless stocks and bonds promise 12 to 15 per cent. The promise of a high return on the money invested is the fetching argument, and these foolish people exchange gold dollars for worthless paper.

THE FOURTH LIBERTY LOAN

Our government is sorely pressed for funds to carry on this great war. It turns to all classes of the American people for help in men and money. Our farm boys have responded nobly. There are none braver in the field today than the farm bred boys. It was so in the Civil War, it was so in the Spanish War, and it will always be so in any war. But we farmers must rise to the full dignity of American freeman and subscribe for the fourth loan as we did for the second and third loans. We must remember that in this we are not donating the money, we are lending it; and what is more, it is the safest investment for our surplus funds that we can make.

Hoard's Dairyman has an especial pride in the standing of the American farmer in this great emergency. It believes in the patriotism and manhood of our farmers. We want to see them make a powerful impression upon all other classes in society by a ready and hearty response to the call of the government for the Fourth Liberty Loan. Make it apparent that there are no slackers among the farmers when Uncle Sam raises his hands for help.

WHAT PHOSPHATE IS DOING

On the 19th day of August this year we picked ears of corn, representing fully two-thirds of the crop, of the Murdock variety which had begun to dent. There are 65 acres of this corn. It was planted the 8th to 15th of May from perfect 100 per cent seed and fertilized with 400 lbs. of 1-10 fertilizer per acre. This corn has gone ahead with a maturing rapidity that we have rarely ever seen equalled. We are convinced that this is largely due to the phosphate in the fertilizer. The ears are abundant, well developed, and we are convinced that what pushed the corn along so remarkably is the phosphate.

Some of our neighbors complain that while their corn shows a good growth of stalk it is not earing satisfactorily. Right at that point is where the phosphate comes in. Phosphate has to do with the formation of the seed more than with the stalk in either grain or corn.

It looks now as if this corn will be nearly ready to cut and stook in two or three weeks more. It was cultivated five times and hoed once and is very free of weeds. Is it not quite unusual to have corn begin to dent by the middle of August? If we can hurry our corn along so as to escape early frosts, is it not a big advantage? What do our readers think of the proposition as we have stated it?

DISCONTENT

There are two kinds of discontent. One leads to destruction and the other builds. Discontent of the right character is highly commendable, for without it we make little or no progress. It is one of the developing forces of the human race. A man wholly satisfied with himself, with his occupation, or with his surroundings is in a state of stagnation and gradually dying. A discontent which leads people to improve themselves and to improve the industry in which they are engaged leads to success.

Paul said in a letter to the Phillippians: "Not that I speak in respect of want; for I have learned, in whatsoever state I am, therewith to be content." By this Paul did not mean self satisfaction; to be content with injustice; or to have wrong principles prevail, but rather to accept conditions and circumstances as they were without being unhappy. He believed in the divine discontent which leads men forward and upward, and yet to be content in the struggle to bring about the better things in life.

So in our struggle for justice and liberty for all humanity and in our work to bring about better conditions in farming, let us be content with our lot, but with a divine discontent to stimulate us to do our duty in establishing right principles and practices between all classes of people.

A discontent which directs men to act for better things, for equal opportunities is highly commendable. But to create a discontent for the purpose of breeding malice and hatred between classes and to divide industries into groups is deplorable. No act would lead this nation faster to destruction.

UNITY OR CLASSES, WHICH?

The world seems out of joint, and we have those who would use our present situation for selfish and ulterior purposes. Some of these men would form us into groups according to occupations, religious tendencies, or nationalities. These men would destroy the unity of purpose which is so vital to the welfare of the nation. War has proven to us that essential industries are vital to our nation and to divide them would lead all to destruction. Agriculture without doubt is the important peace industry, but other industries are essential. The farmer would suffer untold hardship if the manufacturer should pass out of existence and the manufacturer would suffer if the farmer were not treated equitably.

Then why this attempt to breed discontent that leads to destruction; why this attempt to divide our industries into separate classes for the purpose of creating hatred and dissatisfaction? This is not what our country needs or any industry desires. What is needed is thoughtful consideration as to how each industry may have equal opportunities. The farmers of this country do not desire special privileges. But they do desire equal opportunity with other industries. To secure this it is not necessary to array them against others engaged in essential industry, but rather to discover ways and means of providing equal opportunities.

AREA TUBERCULIN TESTING

Practically every herd of cattle in two townships of Waukesha County, Wisconsin, has been tested for tuberculosis in the "area clean-up". The state veterinarian advises that so far less than seven per cent of the cattle have reacted, and it is believed that this figure will be reduced to five per cent when the census and tests are completed.

The work now being done in Waukesha County is the outgrowth of the idea that the tuberculosis question will not be adequately met until all herds are regularly tested. The present hit-or-miss system is certain to leave large numbers of tubercular animals on the farms, there to further spread the disease among the healthy young animals. A rather complete discussion of this system of area testing was given in our columns last winter, but in brief it is as follows: The State Department of Agriculture will undertake to test every herd in a certain circumscribed area, providing a majority of the stock owners petition for the same. Thus far, Waukesha and Barron Counties have completed their petitions, and preliminary work was started in the former county last February.

As was to be expected opposition has developed and some breeders have got out "injunctions" to prevent the testing of their herds. To abandon the work now would be doubly unfortunate and every wide-awake and constructive breeder should put his shoulder to the wheel and give this movement the support it deserves.

Under improved methods of control communities can look forward to decreasing the ravages of tuberculosis rather than see it increasing as it has done under the methods of control exercised in the past. Clean herds are valuable to the producer of milk as well as to the breeder of sales stock, for few appreciate what the loss by death and depreciation has actually been on the farms of this country.

RETAIL MILK SITUATION

The Cost of Delivering Milk

The numerous milk hearings which have been held in all parts of the United States, to determine a fair price of milk to the producers, have brought forth much information concerning the retailing of milk. Milk producers everywhere held, and rightly too, that the prices paid them for milk were too low. The milk situation everywhere became so acute that many milk producers threatened to sell a part or all of their herds. On the other hand, the consumers were complaining because of the high prices charged for milk. In some instances the consumption of milk was materially decreased.

The milk situation has not been comforting or satisfactory and not a great deal has been accomplished to bring satisfaction to producers and the consumers. At the present time the producers in New York are getting about 6 cents a quart for milk and the consumers are paying 14 cents a quart for this milk pasteurized, bottled, and delivered. There is a cost of 8 cents for getting the milk from producer to consumer, when delivered in bottles. Bulk milk can be bought from stores for 10 cents a quart and bottled milk for 13 cents.

The producers feel that the cost of delivery is too high and that they are not receiving their fair share of the consumer's dollar. The milk distributors have so far been successful in producing evidence that it requires the margins which they are receiving to deliver milk. There we are,—the problem of marketing milk economically still unsolved.

It is to the advantage of the producers that milk be delivered at low cost, for this means increased consumption and better prices for him. The importance of milk to the welfare of the nation, the dissatisfaction which exists upon the part of the consumer and producer, and the complex problems of the milk business warrants, we believe, the several states and the federal government to undertake the task of securing more information concerning the cost and methods of marketing milk.

They could enter the milk business in several large cities on a sufficient scale to determine the cost of marketing milk and to determine the most economical methods. We do not believe it will be as difficult to determine the cost of marketing milk as it is its cost of production. Attempt has been made by the Dairy Division, several state experiment stations, and some business organizations to find out what it costs to produce milk. The information so far is not complete, but that which has been gathered has helped in solving the price which the producer should receive for milk. The information regarding the cost of marketing has been obtained from those engaged in the business, and even though accurate, its source leads the producer to be suspicious.

For the sake of harmony and understanding, we believe that some of our state experimental stations in co-operation with the Dairy Division could well afford to investigate the methods and cost of delivering milk.

SOLDIERS OF THE SOIL

The national government could pay the farmer no higher compliment than through its appeals for greater production of agricultural products. To know that agriculture is vital to our success and our allies should make the farmer feel that he is rendering a most important service to his country. The boys left upon the farms, because they are considered by the government as being more valuable there than in active war work, may well consider themselves rendering their country a necessary and patriotic service. Soldiers of the soil, as they have been designated by some, is not an inappropriate term to apply to these boys and it does not compliment them too highly.

There is no industry of higher value to our country now, because the United States is the great food reserve of the world. The farmers fully appreciate their responsibilities and are nobly meeting them. Many of the farm boys have been selected for active war work, because this country must build a strong army. Instances can be cited where boys have been taken from the farm that would have rendered a greater service if left on the farms. Experienced farm labor is difficult to obtain and some farmers have been seriously handicapped because of the shortage of competent farm help. The farmer has always worked long hours, and applied himself industriously to his job, but under his present circumstances he is working harder. He is co-operating admirably with his government.

Many farm boys are not satisfied to be simply soldiers of the soil, and have claimed no exemption from army service. Thousands of them volunteered, because they desired to enter the army rather than to remain on the farm. The increased demands for a larger crop production and the taking away of experienced farm labor from the pursuits of agriculture have thrown upon the farmer and his family a heavy burden. They have met their duties as the boys in the trenches have met theirs.

The farmer, like the soldier of the trenches, has grumbled, but it has been no more serious than that of the soldier. Men weary with heavy burdens have a right to grumble, if it makes their burdens lighter, and no one need be condemned. The farmer, like all American citizens, knows that everybody who is worthy of the name of American citizen, is doing his very best. The farmer can be counted upon to do his full share, and it should be an encouragement for him to know that his occupation and his labor are playing so important a part in our great struggle.

Brick Silo—Ensiling Corn Stover

I am building a pit silo, 20 ft. of which will be under ground, and 10 ft. above ground, by 14 ft. diameter. The silo is being made of bricks which are held in position by mortar made of a mixture of white lime, sand, and water. Can you inform me if the walls will be air tight, or whether it will be necessary to plaster it over with cement? I am particularly anxious to have it air tight, as I understand that the silage will spoil unless the silo is absolutely air tight.

I am planting corn to fill this silo but on account of the high price of the grain would like to know if the part of the corn plant remaining after the ears are removed will make good silage. Corn sells here at $3.00 per bushel, and this seems a lot of money to pay for cattle feed, when you consider that the most that the best cow I have will give is 30 lbs. of milk a day; and when you consider that I can always give them fresh green grass, and can also give them grain grown locally, which is infinitely cheaper than corn and is good feed if not better than corn.

Jamaica, W. I. L. H. F.

Unless the bricks are of the vitrified type and the mortar is impervious to the action of such acid as may be formed by the fermentation of the corn, it would be desirable to plaster the interior with a Portland cement mortar.

Common clay brick are very porous and not only admit moisture, but will draw the moisture from the silage next to the wall. This will cause spoilage next to the wall and is probably a larger reason for plastering the interior than the small amount of air which may seep through the semi-porous brick. If the silo is plastered it will be desirable to whitewash it on the inside with cement mixed with water to a creamy consistency.

Experience in the United States has been that where brick silos have failed it has almost invariably been due to poor reinforcement or poor foundations. A brick silo set in a mortar made of one part lime to five parts cement is sufficiently strong. The presence of a small amount of lime in the mortar makes it possible to move the bricks slightly while laying without destroying the bond as would be the case with pure cement mortar. One method of reinforcement consists in the use of steel woven wire fencing. The outer wall of brick is built up five courses at a time, then the reinforcing wires are put in place and fastened at either end to the iron brace at each side of the doorway. This wire is pulled as tight as will allow the next course of brick to be laid easily and is held in place by loose brick until the next course is laid. The inside wall is built up five courses and then a header course laid, that is, alternate bricks are laid crosswise in the wall to bind the two sides together. Before putting on the header course any space left in the center of the wall between the bricks is slushed full of sloppy cement so as to bed the reinforcing wires solidly in the concrete.

Corn may be husked and the stalks ensiled, with a fair grade of silage resulting. In ensiling this corn stover an amount of water equal in weight to the fodder ensiled should be added in order that the cut material will properly pack to prevent spoiling and that the resulting silage may have the succulence of the regular corn silage. This method of ensiling corn is discussed in our issue for August 16th. In view of the fact that the ear corn sells for such a high price and other grain can be purchased more cheaply, it may be profitable to allow the corn to cure as ear corn rather than to ensile it. However, under general conditions existing in this county, we find it desirable to ensile the entire corn plant rather than to attempt to husk out the ear.

Beet Top Silage

With sugar beets selling at the dump at the rate of $10 per ton regardless of sugar content, what would the tops be worth to put into the silo for feed for dairy cows? What would be an average yield of tops per acre? Do you consider beet top silage a good feed for cows when fed in a combination with alfalfa? Does this silage have a strong purgative effect? Should the tops be run through an ensilage cutter? How are the tops generally handled from the field to the silo? Should they be put in immediately after being cut off the beet?

My corn crop was a failure this year and I have an opportunity to buy beet tops. I would have to haul them about one-half mile. Do you think it would pay me to buy this crop. I have a 60-ton pit silo, my own 13-inch cutter, and electric motor. Last year it cost me $6.25 for "juice" to fill the silo with corn.

Miles City, Mont. G. E. F.

The average yield of sugar beets gives about four tons of fresh leaves and one ton of the severed part of the upper portion of the roots per acre. The leaves of sugar beets have about one-half the feeding value of the roots. They have been used to some extent in the making of silage but are purgative in effect and should be fed in limited quantities and in conjunction with a liberal supply of hay. The tops may be ensiled whole but they keep somewhat better if they are run through an ensilage cutter. It is recommended that the tops be ensiled with some other roughage, one of the methods of filling a silo being to put in alternate layers of beet tops with cut straw or dried fodder or stover. Another plan which seems to be practicable is to ensile the beet tops along with corn fodder, using about an equal weight of each and seeing that enough water is run in that the mass packs tightly. The tops should be ensiled as soon as possible after being cut from the beets.

The purgative effect of beet tops can be reduced greatly by liberal feeding of other roughages. It is also recommended by some feeders that about three ounces of chalk or ground limestone be fed with each hundred pounds of beet top silage. Some farmers have added salt to the quantity of seven pounds for each ton of leaves ensiled and have reported good results.

While it cannot be said that beet tops will make the highest quality of silage, the feed is said, by those who have used it, to give fairly satisfactory results.

Liming Alfalfa Sod

Last spring I seeded six acres to alfalfa with barley as a nurse crop. I succeeded in getting a good stand but it is very weedy. At the time of seeding I was unable to procure lime and would like to know if the lime could be applied as a top-dressing this fall. Is it good practice to apply lime to alfalfa each year? After which cutting should it be sown?

Manchester, Mich. H. S. F.

Lime can be applied as a top-dressing at any time. However, this would necessarily be either finely ground lime rock or lime that has been thoroughly air-slacked. Quick lime would, of course, injure growing alfalfa and coarsely ground limestone would not become readily available to the plants.

We are not at all certain that it is the lack of lime which has caused the trouble. The safer practice would be to test the soil with some blue litmus paper such as may be secured at the local drug store. If this paper turns red when imbedded in a small quantity of moist soil, it would indicate an acid condition and that it was desirable to apply lime.

If the soil does not prove to be acid, there are, of course, several explanations as to what may have caused the relatively poor stand this year. It may have been due to freezing weather or to the lack of sufficient fertility in the soil to give the alfalfa a good start. These would seem to be the two most possible reasons for the trouble but there are numerous other factors to be considered.

When ground limestone is applied at the rate of two tons or better per acre it is not necessary to repeat the application oftener than once in three to five years. The application will be most serviceable if applied on the plowed ground before seeding the alfalfa, but may be applied at any time. When applied on alfalfa sod very finely ground lime rock or air slacked lime should be used as they become more nearly immediately available for correcting acidity. Somewhat coarser ground lime rock is preferred by many when applied to plowed ground, using it in somewhat greater quantity. By this method the rock disintegrates as needed by the growing crops and smaller proportions are washed away or dissolved and carried deeper into the soil.

Oats Fail to Fill

Practically every field of oats in this section is affected with a blight that has caused the heads to fail to fill properly as indicated in the sample I am sending under separate cover. Oats and other grain have had ideal growing weather, with plenty of moisture and not too hot weather. They have made excellent growth and promise a splendid crop except for this blight, which affects alike fields on high and low ground, fertile and unfertile fields, and erect as well as lodged grain.

Fort Atkinson, Wis. P. C. B.

I have examined the sample of oats which was sent in and find that the oat heads are affected with what is known as imperfect fertilization. We scarcely know what causes this lack of fertilization and many parties are working upon the proposition to know just why the fertilization does not take place in these particular glumes. My theory is that it is quite largely on account of the organs of fertilization being destroyed by heavy dews or sudden rains.

The oat has a perfect flower, i. e., both male and female parts being within a single glume. If either of these organs are interfered with the fertilization would not take place. When conditions are just right this imperfect fertilization is noted in oat fields. We have never found that it has occasioned any great loss from this although by looking at a field one would almost expect that he would suffer great loss. However, the oat panicles seem to spread out more when the fertilization is not perfect in some heads and take the place of those so lost thereby giving a normal crop.

Wis. College of Agriculture. R. A. MOORE.

Cowpox—Fall Pasture

Kindly inform me what the cause is of cowpox on the cow's teats and what will remedy it?

What will provide the best fall pasture after the oats has been cut, and will it be profitable and grow in this part of the country?

Greenwood, Wis. A. E. P.

Bathe the udder twice daily with lukewarm water containing a teaspoonful of granular hypo-sulphite of soda or hypo-chlorite of soda to the pint and apply glycerite of tannin to the sores as often as found necessary. Isolate the cow and milk her last, as the disease may be spread from cow to cow by the milker's hands.

Fall sown rye or wheat will provide good fall pasture and also early spring pasture. However, we know of nothing that can be sown that will give pasture early this fall, although almost any of the grains if sown now will make fair to good pasture. Barley is said to be best for late summer seeding as it is less liable to rust.

Percentage of Holsteins in United States

I would like to know what per cent of dairy cattle are Holsteins. A man has told me that over 50% of all the cattle, beef and dairy, in the United States were Holsteins.

Stamford, Conn. P. F. H.

It is very difficult to estimate the percentage of the total number of dairy cattle in this country which is made up of Holstein cattle. In the first place there are no accurate figures to show how many Holstein cattle there are living at this time. Since the beginning of registration of Holstein-Friesian cattle in 1886 there were registered a total, both bulls and cows, of 608,130 animals up to September 1st, 1917. There are about 23,000,000 dairy cattle in the United States. It will be noted, therefore, that even though all of those Holsteins were alive they would make up but about 2½ per cent of the total cattle population. As a matter of fact it is probable that not more than about three-fourths of one per cent of the dairy cattle of the United States are registered Holstein-Friesian animals.

Cut Oat Straw to Cows

I find that we are going to be short of hay for our cattle next winter and am planning to use good oat straw cut up with our dry corn fodder, sprinkling diluted molasses over it, and plan to give the cows one feeding of it a day, using silage and other hay for one feeding. Do you think this would be a good ration for dairy cows? I shall be glad to know of your experience with it.

Chicago, Illinois. J. H. M.

There is very little advantage in feeding finely cut oat straw and dried corn fodder to cows even when it is sprinkled with diluted molasses to make it palatable, except as a filler. Since there is apparently a liberal supply of silage available together with a limited amount of hay, it is very questionable whether oat straw can be fed to any advantage whatever. The dry corn fodder might be placed before the cows so that they can pick it over, thus securing the palatable portions and adding somewhat to the variety of their rations.

Even at the high prices of hay last winter, high quality legume hays furnished nutrients at less cost than they could be purchased in concentrates. Unless some unusual shipping condition makes the cost of hay in this section unusually high, we recommend that the ration be based on a liberal supply of a legume hay. It will be necessary to purchase a portion of this hay, but we believe it to be economical rather than to attempt substituting low quality feeds, such as oat straw and corn fodder, and making up the deficiency in nutrients by supplying additional quantities of high priced concentrates. Fairly good milk production can be secured with the feeds suggested, provided concentrates are fed in large amounts. If good quality hay and silage are fed liberally, an equal or greater quantity of milk will be produced with a very much lower consumption of concentrates.

The Dairyman's Real Problem

How to overcome Loss of Man Power and To Lower Cost of Production—To Keep Things Going at Home

After Our First Year at War, Necessity Has Produced Many Answers to These Problems, at the

National Dairy Show

COLUMBUS, OHIO, OCT. 10th to 19th, Inc.

You Can Learn What Has Been Done for You. There Will be Labor-Saving Devices—Machinery to Take the Place of Man Power—Improved Methods of Operating. The United States Government is Bringing to Your Show, Helpful Ideas and Suggestions.

To Win the War Must be Our One Great Thought, and the Government wants to Co-operate with You to this end.

The Show this year will be a real patriotic getting together of the whole Dairy Industry to work out its problems.

You can give and receive help by mingling with your fellows a few days at the Show.

Four Departments of Government are bringing to the Show, the meaning of our Industry to the people of the world.

The Greatest National Exhibit of Milk, Butter and Cheese Ever Assembled.

Creamery Men—Cheese Makers—Ice Cream Manufacturers—Cattle Breeders—Milk Dealers.

Dairy Farmers Will Hold Big Conventions

There is a duty and an opportunity in why you should not miss this Show this year. We must feed the world, and restock Europe with Dairy Cows.

Machinery Exhibits—Infant Welfare Demonstrations—Dairy Products Manufacturing Demonstrations—Home Economics School—Best Bred and Most Practical Cattle in the World.

Horse Show—Cattle Judging—Competitive:—Students' Products Judging—Bull Clubs—Calf Clubs. Cow Testing Associations—Lower Cost Feeds—Practical Farm Herds of Cattle.

Read your paper closely for stories of the valuable events to take place at this year's Show.

JENNEY SILO-FILLER-HUSKER

HUSK THE CORN FROM YOUR SILAGE

Put the corn in the crib and the stover in the silo. It is a useless waste of money to put $1.50 corn in the silo when good silage can be made from the corn stalks. **The Jenney-Silo-Filler-Husker.**

Turns Your Waste Stover Into Wealth

It picks out and husks the ear corn and fills the silo at the same time. It's something new—a machine that marks a new era in farming.

Send for a free copy of Robt. T. Jenney's 36-page illustrated book, entitled "STOVER SILAGE" which tells all about the feeding of Stover Silage and how to fill your silo and save 500 to 800 bushels of corn.

Mich.	Allegan Co.	L. L. Rockwell	"	264	16	65	John Barron

*Over 50 lbs.

Association Notes

Middlesex—Somerset, New Jersey—There are now 20 pure-bred bulls used in this association out of a total of 21. The July price for 3% milk here was $2.25 per hundred pounds. Milk retails for 12 to 15 cents and butter for 60 to 70 cents. Unicorn costs $51 to $65 per ton, according to date of purchase; Schumacher, $58 to $65; dried brewers grain, $50 to $60; oats, $60 to $70; hominy, $64; hominy feed, $54; oil meal and cottonseed meal, $60 to $65; bran, $45 to $55; corn and cob meal, $60; barley feed, $54; clover, $25; alfalfa, $30 to $35; timothy, $25 to $30; and corn silage, $7.50 to $8.

Winona County, Minnesota—Several pure-bred sires are being changed for others in the county, these sires being too good to leave the association. A great many of the scrubs are being turned off and new cows of the dairy type put in their places. Beef is high now, and a good-sized scrub will bring nearly enough to buy a fair cow. Four new milk houses are being built, three being hollow tile, with tile and concrete roofs. One modern dairy barn has been built. Only four members are feeding silage and grain. Silage is valued at $5 per ton and grain at $52. Nine new milking machines are in use and giving good success.

Walla Walla Valley, Washington—The average production of milk by the cows listed in this association for July was 616 lbs., containing 25.4 lbs. of fat. The average feed cost was $7.05 and average profit above feed cost, $5.42. In July, 1916, the average milk production in the association was 522 lbs.; in 1917, 540 lbs. This showed an increase of the average of 94 lbs. in the two years. Farmers received 40c per lb. for butterfat in July, 1917, and this year the price is 25% more, or 50c per lb. On the other hand, the increase of the cost of milk production has been considerably above this percentage.

Jesup, Iowa:—In July the creamery paid our members 49c for butterfat and retailed butter for 47c. Big Q sells for $60 per ton; oil meal, $54; and oats, $.70 per bushel.

West Bend, Wisconsin:—This association has just finished its first month testing. A Jersey owned by Richter Bros., in her tenth month of lactation, has produced 688 lbs. of milk containing 41.3 lbs. of butterfat. The members are very enthusiastic over the work and are expecting to increase their list of 40-lb. cows very considerably. They are hoping to place a goodly number of their cows in the Register of Production, which requires a production for the year of 365 lbs. of fat.

Van Buren County, Michigan—Five poor cows were sold in July. Many of our members are feeding grain, hay, or silage because the pasture is very short due to severe drought. Twenty-five cents per gallon was paid for July milk, the creamery paying 46c per pound fat. Silage is priced at $6 per ton; hay, from $15 to $20; corn, $1.60 per bushel; oats, 90c; commercial feeds, $3.25; and wheat bran, $1.50.

Pioneer, Idaho:—The number of unprofitable cows sold this year for beef to date is 39 and the number of better cows purchased to replace them, 33. Six pure-bred bulls have been purchased. In July, milk sold here for 50c per gallon, the creamery paying 46c for fat and the cheese factory, 52c. Milk retails for 12½c. Hay has a local value of $12 per ton; oats, $2.75 per hundred pounds; barley, $2.50; and bran, $1.50.

Allegan County, Michigan—In July the condensery paid our members for milk on the basis of 90 cents per pound butterfat.

Feed is priced locally as follows: Hay, $25 per ton; bran, $31; ground oats, $61; ground corn, $62; cottonseed meal, $55; oil meal, $63; beet pulp, $43; and gluten, $54.

Mason City, Iowa:—The highest herd in our association in June consisted of 10 grade cows which averaged a production of 1,072 pounds of milk containing 43.5 pounds of butterfat. These cows received no feed outside of pasture and illustrated that a grade herd may be built up, which is highly profitable. Pasture in our section has continued to be exceptionally good because of liberal rains, and but few of our members are supplying grain to their cows as yet.

Texas Has Drought

HOARD'S DAIRYMAN:—We are experiencing another year of drouth which will give us a short forage crop. In this part of the state the silage crops went into the silos in July. Some early planted corn made a fair yield of silage, but the sorghum grains and ribbon canes which grow slower and mature later were cut short and had to be cut before they were matured.

In the southern part of the state the early planted stuff perished in May but the later planted crops that got a good rain in June will make good silage by now. The dairy business was just getting a good start here but the continued drought will give it a serious setback.

Fort Worth, Texas. S. R. H.

Milk Inspectors' Convention

The Executive Board of the International Association of Dairy and Milk Inspectors have voted to hold the seventh annual convention at Hotel Sherman, in Chicago, Monday, Tuesday, and Wednesday, October 14, 15, and 16. A program covering a wide range of subjects relating to the supervision and improvement of milk supplies is now being arranged.

If sorghum syrup and sugar cane syrup is sealed to prevent fermentation, it will provide a good winter sweetener. Well made cane syrup can be used to take the place of sugar even in coffee.

Watch For Registration Day

The President of the United States will soon announce by proclamation, a Registration Day to be held as early in September as possible.

More than 2,000,000 men are needed to put our army on a 5,000,000 men basis. 13,000,000 are expected to register.

Class one is nearly exhausted. This Class must be replenished from new registrants not later than October 1st.

Who must register:

All men from 18 to 20 years of age, inclusive and
All men from 32 to 45 years of age, inclusive, should watch closely for the President's Proclamation, definitely designating who must register.

Where you will register:

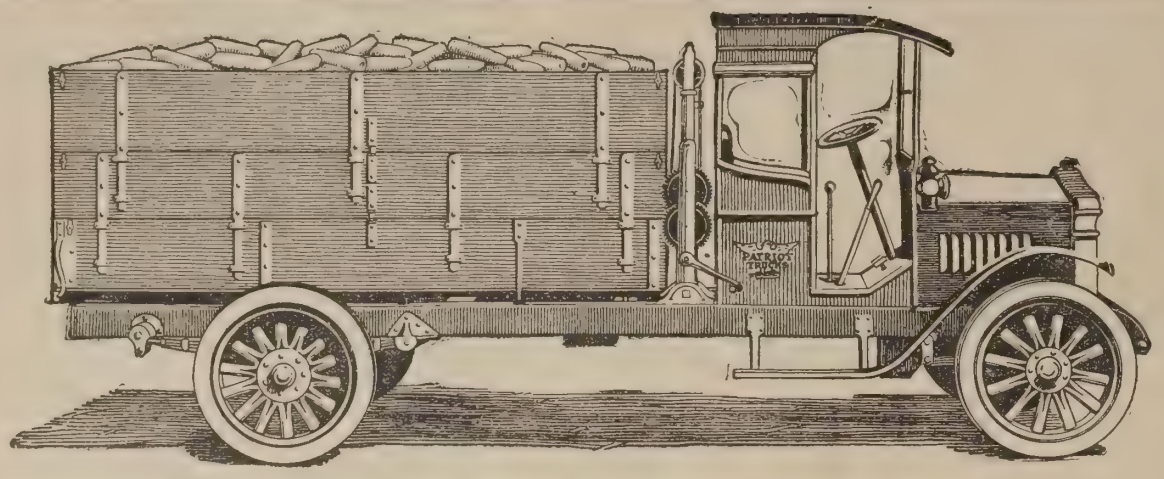
In the customary voting precincts in the jurisdiction of your Local Selective Service or at other points to be designated.

Sick and non-resident registrants:

These will be furnished cards by their Local Boards. The sick will be registered by persons deputized to do so. Non-residents may register by mail through the County or City Clerk of the place at which they are stopping. Special provision will be made for felons, persons awaiting trial and others confined in jails or institutions.

The Government of the United States asks your hearty co-operation with your Local Board in making the registration a complete 100% catalogue of every man of the ages to be announced in the President's Proclamation. Selection will take place later by the usual classification method.

The penalty for failure to register is one year imprisonment and NO man can exonerate himself by the payment of a fine.



WATCH FOR REGISTRATION DAY!

Approved by Newton D. Baker, Secretary of War. E. H. Crowder, Provost Marshal General United States War Dept.

HOARD'S DAIRYMAN

Increasing the Value of the Farm
by Bringing it Miles Nearer the Market

The value of a farm depends largely upon its distance from a good market.

Today distance is measured in minutes, not in miles.

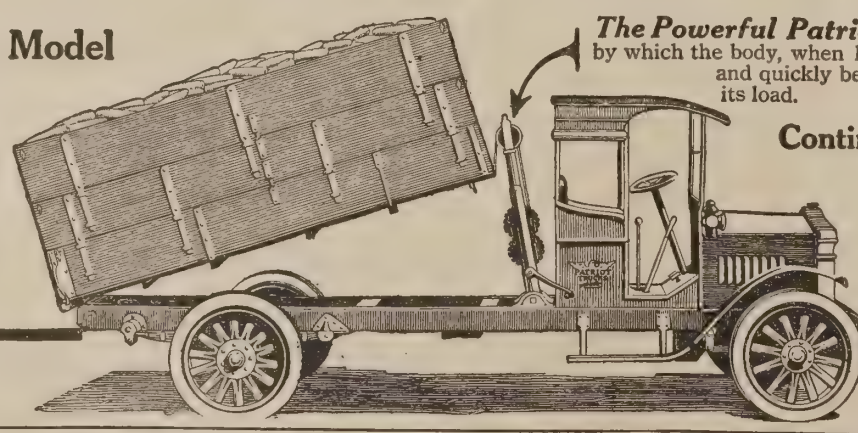
The Patriot Farm Truck (Lincoln Model, 1½ tons capacity) readily transports much more in weight with several times the speed of a horse-drawn wagon.

It lays down at market 15,000 to 20,000 pounds in practically the same time that a team will deliver 5,000 pounds, literally bringing the farm to about one-fourth its actual distance from the market.

PATRIOT FARM TRUCK

Built for Country Roads
Built for Country Loads

The Patriot is the first motor truck built for farm work, and is equipped with a practical farm body, similar to what you have always used on your farm wagon.



It saves horses and high-priced feed. It brings better markets nearer, for with a Patriot you can readily drive loads to a market fifty or one hundred miles distant.

Business farmers can easily see how such perfect transportation greatly increases the value of their farms, to say nothing of the convenience in being master of roads and weather. Every farmer with 160 acres or more should find out what a Patriot Farm Truck will save. Write for information.

Louisiana Dairymen's Co-operative Association Incorporates

(Continued from page 155)

the producers have the whole situation in their hands.

The board is composed of the following good men: J. P. Wallace, J. G. Prichard, Henry Vermeesch, G. L. Plettinger, W. H. Richardson, I. S. West, and Frank Fagot. Any one of the men would make an excellent president. The board will meet within the next month and elect officers.

The big task that confronts the new organization is that of getting the dairymen who were not present at the meeting to come into the association and live up to the co-operative platform set forth in the by-laws. Every shipping point in the dairy district was represented, however, and the belief was expressed by all hands that there would be no trouble in getting 99 per cent of all the farmers to join. It is realized that with only half of the producers in the association, the full purposes could not be attained. It must be a hundred per cent organization in every respect to get the best results. Work is now under way forming local branches of the main association at every place where there are ten or more dairymen. Over a dozen branches have been formed up to date. Only a little opposition is found and those at the head of the association are confident that will disappear when everybody realizes the importance of working together for the common good and in a strictly business way.

When all details have been threshed out the new association will be in control of about 200,000 gallons of milk per month. Every dairyman will pay into the treasury one-half of one per cent of all moneys received from the sale of dairy products and dairy cattle. As the farmer is getting a minimum of 35 cents a gallon, or $4.19 per 100 pounds, for milk at this time—prices will go up in November—it can be seen by a little figuring that the association will have an income of over $350 per month. Annual dues were placed at a dollar a year which will further swell the income. Still another means of obtaining funds is by assessing each member 15 cents per cow whenever the money is needed. With $4,000 or $5,000 annually it is proposed by the board to run the association as systematically and businesslike as a first class bank is run. Every dairyman at the meeting voted to give the association plenty of money to operate on. One reason why the old organization has never accomplished anything is because it never had any funds. The treasurer's report for the full year ended July 31 showed $120 had been paid in and $160 paid out.

That the association expects to carry on other good work besides fixing the price of milk is indicated in the general purpose stated in the by-laws, as follows:

"The objects of this association shall be to improve the methods of milk production, distribution, manufacture, and use; to enable its members to secure the full market value of their dairy products; to encourage the breeding and raising of better dairy stock; to foster co-operation in agriculture, especially in dairying; to buy supplies and dairy cattle in a co-operative way; to hire, buy, build, own, sell, and control such buildings and other real and personal property as may be needed in the conduct of its operations; and, in general, to improve agricultural conditions and bring about a better understanding between producers of dairy products and the consumers thereof."

The first thing the association ex-

(Continued on page 174)

A Little "Tank"—for Farm Work

The Cleveland Tractor is built on the same principle as the wonderful European battle "tanks."

It travels on its own tracks, laying them down and picking them up as it goes along.

This efficient type of construction makes the Cleveland *specially* valuable to farmers, as it enables them to work practically *anywhere*—over almost *any kind* of farm land.

They are being operated over gullies, ruts and ditches, through soft soil, wet clay, sand and gumbo—without sinking or floundering. *They do not pack the soil.*

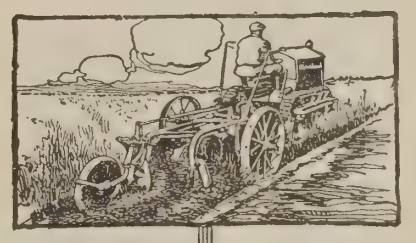
They are working under and among small trees, close up to fence corners, on hillsides and over rough ground with much better results than can be obtained with horses or with any other type of tractor.

And they are working much *faster.*

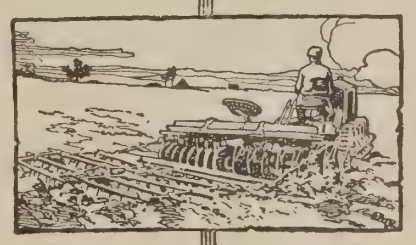
Thousands of Cleveland Tractors are helping to increase the production of food demanded by war conditions.

The Cleveland, pulling two 14 inch bottoms—which it will do under average conditions—plows 3½ miles an hour—eight to ten acres a day. This is equal to the work of *three* men and *three* good three-horse teams.

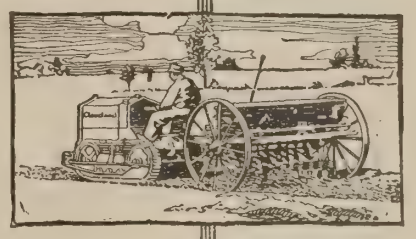
The Cleveland steers by the power of its own engine; it requires but slight effort on the part of the driver. Only one man is required to operate it. 12 horsepower is developed at the drawbar and 20 horsepower at the pulley. It is a constant source of tractive and stationary power for twelve months in the year.



It plows, harrows, plants, reaps, cuts ensilage, runs saws and pumps, drags logs, pulls road machinery, hauls manure spreaders and does practically all the work formerly done with horses or stationary engines.



The Cleveland Tractor produces food but consumes none of it. It conserves man power, horse power, time, energy, and effort—and produces greater returns.



The Cleveland Tractor was designed by Rollin H. White, the well-known engineer. It is manufactured under his supervision. Gears and tracks are protected from dust and dirt. Materials throughout are of the best. The whole machine weighs only about 3200 pounds. It can be housed in less space than is needed for a horse.

Take advantage of present produce prices. Raise *more* food *now.* Help the nation and incidentally make more money yourself by using one or more Cleveland Tractors.

Write for complete information and the name of the nearest Cleveland dealer.

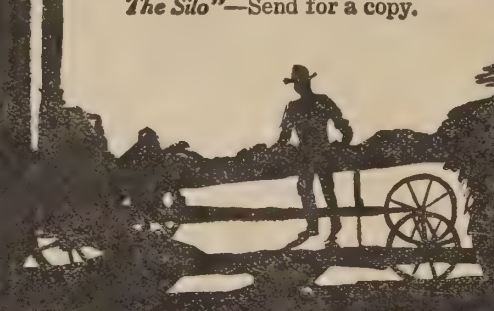
FILLING THE SILO



You can fill your silo with an Ann Arbor Disc Thrower Silo Filler and any engine of more than 4 H. P.—the latest and most scientific development of the silo filling principle. The Disc Thrower is of the powerful, fool-proof "Knife-on-the-Fly-Wheel Type." The one-piece crucible steel knife wheel is just one of the features of the Disc Thrower. It is the safest and most efficient cutter on the market.

Quality Construction

The *Disc Thrower* has a one-piece main frame, giving absolute rigidity. Six fans on the fly wheel combined with the disc thrower principle insure a continuous stream of ensilage without the need for an unnecessary volume of air. The Triangular Shear Bar has three cutting edges and can be quickly changed when dull. End thrust ball bearings eliminate friction and save power.

There are many other features of superiority in the *Disc Thrower* which are described in our new catalog—*"Filling The Silo"*—Send for a copy.

New York Butter Market

NEW YORK CITY, AUGUST 20, 1918: —At the close today quotations were established as follows: Extras (92 score), 46c; higher scoring than extras (93 score or higher), 46½@47c; Firsts (88 to 91 score), 44@45¾c; and Seconds (83 to 87 score), 42@43½c.

Quotations have changed but ¼c during the past week. On Friday of last week extras advanced from 45¾c to 46c and since that time the price has remained constant. The market while yet inactive may be considered firm as all shipments of butter are being picked up by buyers quite readily. There is scarcely a sufficient supply of high grade butter while there are some accumulations of inferior grades but such accumulations as these are have no material influence on the market in general.

The ill effects of the hot weather which has prevailed for some time are still apparent. Shipments from creameries which have reputations for high quality production have in many cases scored as under-grades. Mold is yet very much in evidence as well as several other well known and easily distinguished summer characteristics. The make is decreasing rapidly as is usual during August. Not until cooler weather prevails is it expected that quality conditions will again become normal.

A thin, even coat of paraffine is much to be preferred to a heavy coat which cracks and loosens in large pieces. If air can gain access to the wood, paraffine is of no avail as a mold preventive. Paraffine should be applied only when heated to the boiling point.

The butter from creameries which use a sufficient quantity of salt on the sides and bottoms of their tubs show practically no mold.

A cheap, light-weight liner eventually proves to be dear at any price.

Some creamery managers believe it to be economical to use parchment rather than cloth top circles. A visit to the leading butter markets would convince them otherwise. High class buyers, those who will pay the price, demand cloth circles.

New York. W. B. LIVERANCE.

Green's Holsteins Average Over $800

Ohio's greatest Holstein sale and one of the most successful sales ever held was that staged by A. W. Green at his Walnut Crest Farms, Middlefield, Ohio, June 27-28. One hundred thirteen animals sold for an average price of $814 in a sale that was attended by from 4,000 to 6,000 people each day. This is a success that any Holstein breeder would be proud of and in Mr. Green's case it is little short of phenomenal. In two short years he has built up the herd that made this sale possible.

The 4-month-old bull calf, Potentate, was the feature of the sale. Sired by a 33-lb. (26.4 lbs. fat) son of Pontiac Korndyke and from Leafy Peeman Korndyke, 40.88 lbs. butter (32.7 lbs. fat) in 7 days, she, a daughter of Leafy Dawn DeKol, 3.14 lbs. butter (34.5 lbs. fat) as a 21-year-old, there were several willing to pay $10,000 for the youngster. After that mark was reached, however, the competition narrowed down until it included but 3 men,—B. E. Totten, E. P. George, and Dean Knickerbocker representing the Anna Dean Farm. Mr. George finally purchased the calf on his $25,000 bid.

Queen Hengerveld Rag Apple, an 18-lb. 2-year-old daughter of Rag Apple Korndyke 8th, headed the females, going to T. A. Denman, Ohio, for $2,025. Sixteen others brought $1,000 or more.

Haeger, Kelly, and Perry did the selling with S. T. Wood in the box.

A list of the animals sold, the purchasers, and prices follow:

John Lahner, Ohio

Pure-bred and High Grade Holsteins

CAN FURNISH CAR LOTS OR LESS.
I have a car of yearlings on hand at $50 each. Several bulls from 8 months to 14 months old from A. R. O. dams. Write me for price and photo. High grade Holstein heifer calves, four weeks old, $20 crated.
Yohn's Stock Farm, Watertown, Wisconsin.

CORN HARVESTER Self Gathering for cutting Corn, Cane and Kaffir Corn. Cuts and throws in piles on harvester. Man and horse cuts and shocks equal to a Corn Binder. Price only $25 with fodder binder. The only self gathering corn harvester on the market, that is giving universal satisfaction.—Dexter L. Woodward, Sandy Creek, N. Y., writes: "3 years ago I purchased your Corn Harvester. Would not take 4 times the price of the machine if I could not get another one." Clarence F. Huggins, Speermore, Okla.: "Works 5 times better than I expected. Saved $40 in labor this fall." Roy Apple, Farmersville, Ohio: "I have used a corn shocker, corn binder and 2 rowed machines, but your machine beats them all and takes less twine of any machine I have ever used." John F. Haag, Mayfield, Oklahoma: "Your harvester gave good satisfaction while using filling our Silo." K. F. Ruegnitz, Otis, Colo.: "Just received a letter from my father saying he received the corn binder and he is cutting corn and cane now. Says it works fine and that I can sell lots of them next year." Write for free catalog showing picture of harvester at work and testimonials.
PROCESS MFG. CO., Salina, Kansas.

FOR MILKING MACHINES

Clear and Clean as Water

B-K keeps tubes and cups sweet and clean. Penetrates milk solids—kills the bacteria. Is clean—harmless—cannot taint milk. B-K makes rubber parts last longer—cannot harm metal. Used and recommended by Milking Machine Manufacturers for years. Cheapest in actual use—sold under guarantee. Get B-K today—end sour milk troubles. Send us your order and your dealer's name. Send for dairy bulletins and "trial offer."

ABORTION IN CATTLE

PREVENTED AND CURED PERMANENTLY
YOUR COWS MADE PROMPT. REGULAR BREEDERS BY
STERILOID

STOP LOSING CALVES

TREATMENT: If STERILOID is used at the first sign of abortion the cow will go her full time and have a healthy calf. If your cows or heiers do not come in season, or fail to get with calf, use STERILOID. Cows get with calf after only one treatment. Write today for FREE BOOK. It explains the causes and symptoms of Abortion and tells how to cure Abortion, and make your cows regular, healthy breeders with STERILOID. Also contains letters from breeders who have used STERILOID successfully.

GUARANTEE: We will refund money in every case when STERILOID FAILS to make good. PRICE $1.00. Mailed Postpaid, in plain wrapper.

MARTIN REMEDY COMPANY, Dept. A, 398-408 Columbus Ave., New York City. Reference—Colonial Bank.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Jefferson County, Wis., Boys at Work

What are the boys in your neighborhood doing this summer besides helping their fathers with the regular farm work? Are many of them in business for themselves? Hundreds of the boys and girls living on the farms in Jefferson County, Wisconsin, are. In the four townships about Fort Atkinson there are 314 in this

ERWIN SCHIMMING, WISCONSIN

He expects to have a Holstein herd some day. This is his grade heifer.

work. Mind you, this is not in the whole county; only about one-fourth of the county.

This work was started late this spring by Mr. Henning, local agricultural teacher. It was too late to get good, efficient clubs started so it really is as if each boy were working for himself instead of as a club member. And they are working, too. Recently we had an opportunity to visit some of them and not a fellow but was right up with his work. They were all of them real business men and we predict that the end of the season will find most of them with a profit of dollars and cents as well as experience.

We found them doing different things. About eighty are raising chickens, seventeen have heifer calves, a few have pigs, and the others have corn, potatoes, or a big garden. One boy even has some bees and expects to make money on his honey. Several of them have both live stock and a garden.

At one of our most interesting stops we found three brothers, Harlow, Glenn, and Arthur Sheppert. Harlow, aged 14, is the oldest. He has been in business for himself before but this is the first time he has tried poultry. This year he has about 100 chicks, among them twelve pure-bred Barred Rocks which are to be the foundation of a pure-bred flock. He plans to sell his young cockerels this fall and keep most of the pullets for laying hens this winter.

Glenn is trying his luck with pigs. He has 4 grade Durocs that he is feeding. They gained a little less than a pound a day the first month but he expects better results in the future. He is feeding them a slop containing middlings, ground barley, and oil meal mixed with skimmilk. He finds, however, that they do not do quite as well as other pigs on good pasture. If the venture proves at all profitable this year, he is going to keep one of the pigs for a brood sow.

Arthur, who was busy in the hay field when we were there, has a pure-bred Holstein heifer. He is the only one of the three who will not realize some money on his stock this fall, but in another year his heifer should begin to prove profitable. All of the boys are paying for the feed and supplies they use and they are keeping a record of all such expenses, too. They propose to know whether their business is paying or not.

Now, what do you suppose those three boys are planning to do with any money they may earn in this way? We asked them and found that war saving stamps were to be their investment. They have been in business before and today all their savings are invested that same way. They have $250 worth now.

Erwin Schimming, another of the boys we met, has a grade Holstein heifer about nine months old. She is a good one, and he has wisely decided that, barring accidents, he will keep her for a foundation cow.

These boys and girls had some help to start with. Mr. Henning got them interested and helped them obtain their seed or stock. Since then they've been doing very well by themselves with occasional advice from their parents. Most of them are succeeding. You certainly can do as well another season if you have not started now.

HARLOW SHEPPERT OF WISCONSIN AND A FEW OF HIS CHICKENS

Junior Letters

Hoard's Dairyman Juniors:—Maybe you think I have forgotten all about the junior page but I have not.. I always read the junior letters but I have not written because we all are very busy.

We cannot get any hired man now so I have to do the work in the house while mamma helps papa in the factory. Besides doing our work here and caring for our garden we have planted an acre of corn, beans, and potatoes on our new farm which papa purchased last fall. The farm consists of 140 acres, 40 acres of it are woods. There is a mill situated on our new farm and they are cutting off the hemlocks. Papa rents the farm to the man who has lived there for quite a few years but he has reserved one acre for the garden. We do not get any time to work in our garden until after supper, then we jump into our car at 5 o'clock or a little after, go down to the farm, 2 miles below here, work until dark and then come home. We hired the land plowed, dragged, and cultivated. We also hired the corn planted but we did the rest ourselves. The potatoes have been hoed twice, the beans once, and the corn has been hoed part way across once but we broke our car and had to quit work for that week. Our potatoes look fine. The corn and beans look pretty good but they were frozen some once.

There has been an abundance of strawberries here and the red raspberries are getting ripe. We have a plot of red raspberries, (garden berries) right below the house. It has been raining about all day and the bushes are so wet that we can't pick them very well.

Papa got about 7,000 lbs. of milk a day in June and made 10 cheese and 3 tubs of butter a day. He makes 9 cheese and 2 tubs of butter now. He does not get as much milk as he did last year.

When papa tests milk now I shake the bottle to blend the milk together, empty and wash the test bottles, and put them away. I wash them with warm water and a cleaner and rinse them in warm water.

One of our sailor boys has come home for a 4 or 5-day furlough. I haven't any brothers to go but I have a cousin in a camp somewhere in Pennsylvania.

Papa has bought bonds for my sisters, mother, and myself but he got the thrift stamps.

We did not raise many chickens this year and the skunks dined on part of them.

Well, I must close and eat my supper.

I was delighted to see my letter on the junior page; hope to see this one there too.

I would like to hear from some more of the junior girls and boys. Wish all of the New York State juniors would put their addresses on the junior page.

My own address is Cincinnatus, New York.

Mary C. White.

Hoard's Dairyman Juniors:—We have our barley all out and shocked. Our oats are almost ready to cut. We have 9 Poland China pigs. We have about 75 chickens. I live on an 80-acre farm. We have an automobile. We like it very well. We have a cream separator. It is over 16 years old and it has never been broken. My little calf is doing fine. You can almost see her grow. We are having some rain here. We have two engines, one 12 H. P. and one 1½ H. P. Good luck to all the juniors.

Wisconsin. Gordon Hengstler.

Hoard's Dairyman uniors:—I received your button and fob yesterday as a member of the juniors, and take pride in the dairy work. My father has 20 Jersey cows and 10 heifers that will be fresh within 6 months, and 15 younger heifers. We also have a new registered Jersey bull that we bought last November when 26 months old. He cost $500. All we feed our cows is Japanese cane which we run through a feed cutter, then mix same with molasses. We intend building a silo this winter, of cement, 12x30. We also feed sweet potato vines and green cornstalks. We store our dry cornstalks for the winter or dry season and chop same up and feed with molasses. We also have our own refrigeration, a 2-ton plant. Also an aid life pump which gives us 400 gallons a minute for irrigation. We sell all our butter in Havanna f. o. b. Herradura at $1 per pound, our buttermilk at 60c per gallon, and cottage cheese at 20 cents per pound from all our skimmed milk except what we use for our pigs and calves. The balance of our stock consists of 2 mules, 3 horses, 2 pigs, 10 heifer calves, and about 60 chickens. We have 8 pastures that we change our stock to about every 10 days. We have 10 acres of orange trees, early and late varieties, which pay well. We have let our grape fruit grove go back, as we found it a losing game.

We came to Cuba from Minneapolis, Minn., 13 years ago. My father traveled for the Northwestern Casket Co. for years, through the Northwest. We have had some very hard times here getting the experience of how to farm and what to raise, but 7 years ago we started in the dairy business and have made a success of it. We must ship all our dairy supplies from the U. S., the expense of which means about 50% added to first cost.

I think I have written enough for this time and when we get our stock and grounds photographed will write you again. We like it fine in Cuba. Myron Goetze.

GLENN SHEPPERT OF JEFFERSON COUNTY, WISCONSIN, IS RAISING PIGS

Hoard's Dairyman Juniors:—Well, I suppose you think I am not going to write any more, but I'll drop a few lines to let you know I am still here.

The crops seem to be in good shape this year. We are hoeing our corn nowadays, there being so much quack grass in it.

My father joined the cow testing association so we have a man here every month to do the testing. I heard news today that he enlisted in the army but I don't know for sure. His brother was killed at the front so I guess he didn't like it so he enlisted to kill the one who killed his brother.

I graduated from the eighth grade. There were two Hoard's Dairyman juniors in my class.

Arthur Sorenson has two brothers in Uncle Sam's service now. His father had an auction sale on some of his stock so he could handle the farm better.

The Downing creamery burned down last winter so they haul the cream to Glenwood City, so the creamery is getting a great deal of cream.

Wisconsin. Geo. Jacobson.

Hoard's Dairyman Juniors:—How are all of you juniors? I am well and feeling fine.

My sister and I are going to keep our sheep. It is a ewe sheep and I thought I would buy it from her if she would sell it to me. If she does I will raise some lambs next year. It is not quite a year old yet so you see she is too young yet.

I like to read the Hoard's Dairyman, especially the juniors' page. I don't care so much for the letters as the rest.

We had so much rain here that we can't get corn laid by because it is so tall and when you touch it with the plow it will break off.

As my letter is getting long I will close wishing the juniors good luck.

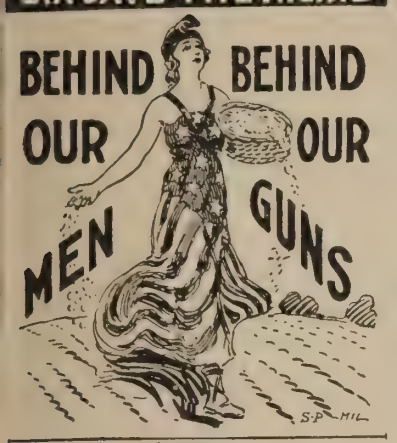
Illinois. Albert E. Post.

Hoard's Dairyman Juniors:—Received my creed, button, and fob some time ago, and was very much pleased with them. I must apologize for not writing sooner but I have been so busy with my farm work that I didn't have time to write.

We are milking nine cows and get about twenty-eight gallons of milk a day. Our cows are all grade Holsteins.

My father is a member of the Holstein Breeding Association which was established about seven years ago.

I had success in my potato crop last year. I planted three bushels of which I received sixty bushels. I think that was a good crop. The weather is fine here and the farmers will start making hay after a week or two. We had a hard hail storm which destroyed all the cabbage and tomato plants what were transplanted before. Frost which we had awhile ago killed all the potatoes that were planted in low land. It didn't bite our potatoes as ours are on a high hill.



I will close this letter now and write some more another time. I wish the juniors good luck and hope also that they will write to me. My address is Paynesville, Mich.

Arthur Lassila.

Hoard's Dairyman Juniors:—Well, we are through with our hay harvest. We didn't get half as good a crop this year as we did last year. We got 20 loads this year and last year we got 37 loads which I think is quite a difference. But I think it is too dry for hay weather. And most of our clover froze, too. Our corn doesn't look very good either, but all it needs is rain. But our barley and oats look all right.

Well, my heifer is still doing fine. We kept a record and she had 38 pounds of milk per day in an average. And, of course, I have some money left over after I have paid the feed. I am satisfied with her because she freshened a long time ago and I suppose when

NO WAR TAX.

she gets older she will get a better average. We had 9,400 pounds of milk for the month of June from our nine cows. I have a camera now and I will send you a picture of my heifer in my next letter. Well, I must close, wishing the juniors good luck.

Wisconsin. Edwin Sebildhaur.

Hoard's Dairyman Juniors:—We have all our wheat cut and our clover up. We will cut oats next week. My heifer is still giving milk. She gives about 13 or 20 lbs. a day. She is just a grade and has been fresh nearly a year. Our other 2 cows are Jerseys. I have two pet rabbits and some Rhode Island Red chickens. I think we will thrash soon. We have 40 acres of wheat, 25 acres of oats, and 45 acres of corn. I have one little turkey and 27 goslings and 4 ducks. I would like to buy a good Holstein heifer if I knew where to get one. I belonged to a corn club last year and won $7 on my corn. We have 17 little pigs. My address is Taylorville, Ill.

William Stumm.

Hoard's Dairyman Juniors:—This is my first letter to the juniors. I got my fob, button, and creed. I read my creed every day. I will write to the juniors whenever I can find time.

We have thirteen head of milk cows, we sell our milk to Mr. Krueger of Ravenna, O. We have a well drilling machine and 6 H. P. gasoline engine. I am the engineer. I start and stop the engine and keep it oiled.

I am going to try to get some of my friends to join the Hoard's Dairyman Juniors and get up a calf club. Good luck to all of the juniors.

Ohio. Carroll Boone.

Hoard's Dairyman Juniors:—It is a long time since I wrote so I thought I would write a few lines. You must excuse me. We went to Polk County in May and I had a good time there. It was 101 miles from Eau Claire. We drove in a car. It took us a whole day to drive down there and we got stuck in many places. It rained almost all day when we went up. But when we went home we had nice roads and it was nice weather. When we got home we found one of our largest pine trees had blowed down. Now I will close, wishing all the juniors good luck.

Wisconsin. Arnold Olson.

Hoard's Dairyman Juniors:—My father has given my brother and me two pigs. We have half share in another. I have a liberty bond and a war saving stamp. I am working for another. We are going to have a fine new school house. We are milking 12 cows. Papa has 10 calves and 3 colts and 7 work horses. My lamb died last winter.

Wisconsin. William Hopkins.

Hoard's Dairyman Juniors:—This is my first letter to the juniors. I am sorry that I did not write sooner, but I have been busy.

I am a Tenderfoot Scout. My Sunday School class has organized a troop of Scouts. There are 29 of the Scouts.

My father is disposing of his grade Holsteins. My brother and I each have a grade Holstein heifer. If my father can sell all his grade calves, he will sell our calves and keep the money. Then he will give us each a registered heifer calf. My father sold 6 grade cows just the other day. He bought 16 registered Holsteins this spring. We do not have much to feed them, as our silage ran out just as the grass dried up. We do not have much hay this year.

My mother tried to raise some chickens this summer. She did not have very good luck as something kept catching them.

My brother and I have some traps set for woodchucks. We caught 4 last summer and 3 so far this summer.

Well, I guess I will close for this time, wishing the juniors good luck.

Michigan. Curtis E. Keefer.

Hoard's Dairyman Juniors:—You ask me how much my cow tests and how much milk she gives. I tried to test her but the acid wasn't any good so I don't know how much she tests, but sometime I will get some new acid to test with. I will then tell you what she tests. She gives 6,000 pounds of milk in her term. She is quite a small cow so she can't give as much as the rest of the cows do. She gives 20 pounds a day. We are making hay now. Papa puts the hay on the wagon and I make the load. We have made about 10 loads so far but we have 15 loads out doors that isn't cut down. Last week I was cultivating corn. I am through with one piece and have started another. I will close for this time wishing good luck to all the juniors.

Wisconsin. Gordon Hengstler.

Hoard's Dairyman Juniors:—I live on a farm of 92 acres. We have four work horses and 3 colts. Papa always has some colts every year and sells some every year. My brother, Floyd, and I always have lots of fun teaching the colts to lead. We are most done with haying and we have got our big barn full to the top. I have a full blood Holstein cow and I raised her calf, a fine heifer, too. I have her in the calf club and may take her to the fair this fall. I always drive the horses on the hay fork and on the wagon with the hay loader behind. Well, I guess my letter is getting long so will close for this time.

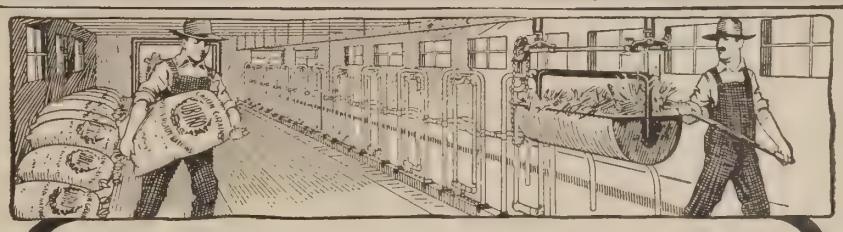
Wisconsin. Roy Keuler.

WE FED YOUR COWS

TRADE UNICORN MARK

¶ Almost every high American record for fourteen years with any breed was made with our Ajax Flakes as an important base of the grain ration.

¶ Unicorn Dairy Ration is the only feed that contains Ajax Flakes.



¶ You can hardly find a pure blood whose maternal ancestors were not fed on Ajax Flakes or Unicorn Dairy Ration.

¶ Unicorn is recognized as a safe, efficient and economical dairy feed.

¶ Unicorn during the past year made more high records than any other brand of feed.

¶ Unicorn really costs less per pound of milk or fat produced than other feeds.

Chapin & Co., Dept. Z, Chicago

Avoid Waste! — Feed a Perfectly Balanced Ration

A COW needs certain proportions of various foods for maintenance and entirely different proportions for milk production. If you are feeding more carbohydrates than are necessary, the amount not balanced by protein is waste.

UNION GRAINS

plus your hay, silage or other roughage, forms a perfectly balanced ration. It contains all the digestible nutrients required to keep your cows in condition and insure maximum milk flow. Union Grains is absolutely safe. It is made only of concentrates, no fillers. It is bulky, 8 quarts weighing about 6 pounds. It is palatable and highly digestible. The Food Administration wants you to order your winter supply of feed now while the railroads can handle the shipments. They allow you to order a four months' supply for shipment in sixty days. Union Grains will keep indefinitely. It contains only 8% moisture. At present the price is comparatively low. Place your order at once. Your dealer has Union Grains or can get it for you. Don't accept a substitute.

Write today for record sheet that will show whether you are securing maximum results from the ration you are now feeding.

THE UBIKO MILLING COMPANY, Dept. H, Cincinnati, Ohio

Who Fills *Your* Silo?

There's just one way of being sure of a full Silo of clean cut ensilage. That is to fill with your own equipment. A 3 or 4 H. P. gasoline engine will operate a small PAPEC. If a saving of $75.00 to $150.00 yearly appeals to you, write today for our new 1918 catalogue—it's free.

PAPEC MACHINE CO., 116 Main St., Shortsville, N. Y.

Position wanted as herdsman. Life experience; age 33. References. BOX 211, care Hoard's Dairyman.

Condensery "Bloats" to Hogs

A correspondent who can purchase e cans of condensed milk which are rown out of storage because of some fect in keeping quality inquires ether this milk can safely be fed hogs. He can purchase milk test- 8% fat in these "bloats" for $.60 r 100 lbs.

Professor O. F. Hunziker replies as lows:

"I presume that when you speak of ndensed milk you here refer to the called evaporated milk or un- eetened condensed milk sterilized hermetically sealed cans. The real, nuine "bloats" of evaporated lk usually are the result of a very sistent spore-bearing germ, gener- y of the species of plectridium tidum. The contents of these ats have a very intense foul odor, embling that of aggravated cases Limburger cheese or rotten eggs. is odor is so penetrating and per- tent that when it once comes thor- ghly in contact with anything dead living, it will follow it to the grave. ether or not milk of this kind uld be directly harmful to the hogs lo not know, but I would certainly afraid that the pork would be in- ted with the odor. I would therefore not recommend to feed that kind of "bloats" to the hogs.

"However, very often there are only a few bloats in each case, and the rest of the cans, while they have undergone some fermentation, may or may not show this type of spoiling. Sometimes their contents are very sour, sometimes bitter, and in most cases curdled. I do not believe that these less obnoxious fermentations would render the milk unsuitable for hog feeding, and if I were doing the feeding, I would not hesitate to try the experiment. It would be wise, however, to use a rather limited amount of this spoiled milk per day per hog.

"If the condensed milk of which you speak refers to sweetened condensed milk in hermetically sealed cans that caused the cans to bulge, the fermentation almost invariably is caused by yeast similar to baker's and brewer's yeast. I do not believe that the feeding of this kind of milk would in any way prove harmful to the hogs except that very excessive feeding of it might cause intoxication."

A rainy day job,—that heap of miscellaneous hardware in the shed may be worth sorting over.

$72 for a $200 Cow

HOARD'S DAIRYMAN:—Noting your interest in cow testing associations, I wish to give an illustration of their value to the farmer.

One cold, blustery day last March I went to an auction of grade Holstein cattle. I purchased about 10 head at prices from $125 per head down. There was a large blue cow, a 3-teater, brought into the ring. She weighed probably 1,400 lbs. I passed her by as "N. G.". She ran up to $71 when the auctioneer turned to me and said, "She's worth more than that for beef." I bid $72 and got her along with a lot of chaffing from the crowd. I took her home, dried her off, and figured I'd sell her as a "canner". However, she became too heavy with calf and I let her run practically wild on a good pasture. She freshened June 28 and, as I test all my cows or rather have them all in the testing association, to my surprise I found she was one of my best cows. During the past month she gave 1138 lbs. of milk with a test of 4.1 per cent, that is, giving 46.7 lbs. butterfat; price of her milk at the condensery was $2.80 per cwt,, and the value for the month, $31.86 without any special feed, and in spite of heat and flies.

Had her previous owner been a member of an association and had her record, instead of bringing him $72 she would have easily sold for $200. This cow shows up the value of association records. I expect this cow to land near the top of the association this month.

Wisconsin. W. P. WALSH.

Jersey Cattle Notes

For week ending Aug. 16, 1918:

Number of animals registered: Bulls, 145; cows, 557; total, 702. Number of transfers recorded: Bulls, 191; cows, 557; total, 748.

The State Government of Australia has guaranteed 83 cents per bushel for wheat, and the Commonwealth Government has allowed an additional 12 cents per bushel for the 1918-1919 harvest, making a total of 95 cents per bushel.

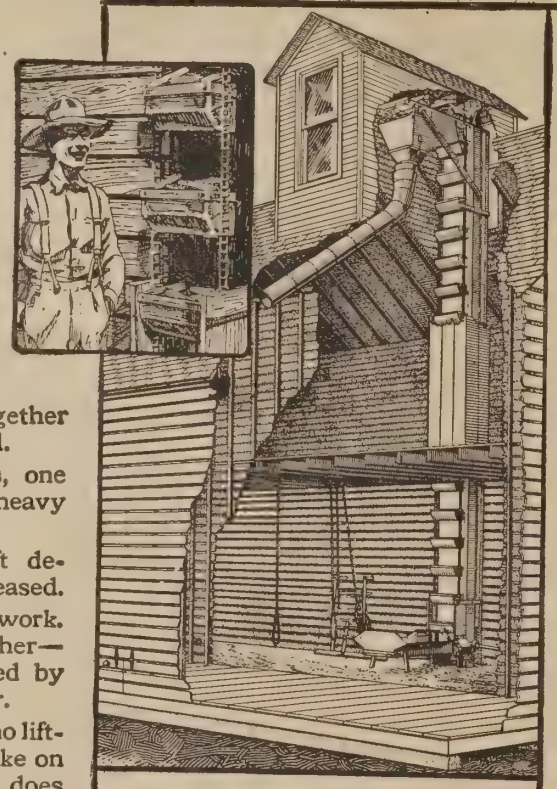
The importance of cereal grains and sugar in the diet of warring nations is reflected by an Australian food order in effect last April. Every farmer was permitted to buy 4.4 pounds of sugar for every four bushels of grain delivered.

You Can Unload A Wagon In Less Than Five Minutes With A JOHN DEERE ELEVATOR

No back-aching job shovelling over your head when you are most tired—you rest while the wagon is being emptied. The work is done five times as fast and ten times as cheaply. No matter what style of crib or granary you may have, there is a John Deere Grain Elevator that will do this work economically for you.

John Deere Inside Cup Elevator

Handles ear corn, rice and all small grains. Cribs a load in 4 or 5 minutes—saves 25 to 30 minutes per load.



Easy to install—all intermediate sections are 8 feet long. Side timbers are bolted together with joints overlapped.

Large capacity buckets, one piece steel. Extra heavy chains.

Roller bearings—draft decreased—service increased.

Always in position for work. Not exposed to weather—lasts longer. Operated by horse or engine power.

Wagon unloads itself—no lifting, simply release brake on the dump. Gravity does the work—no strain on the horses.

Blue print plan book FREE—*"How to Build a Corn Crib and Granary in One,"* also 156 page text book on farm machinery, *"Better Farm Implements and How to Use Them."*

To get these books state the implements in which you are interested. Ask for package E 39.

John Deere Portable Steel Elevator

Unloads a load of corn or any small grain in three to six minutes with either horse or engine power.

Screen separates shelled corn from ear corn.

Smooth running. Runs on roller-bearings and has self-aligning boxes.

Does not sag—bridge trussed.

Built of steel—cannot warp or decay.

Raising receiving hopper folds inside the elevator when not in use, and when in use delivers all the grain into the elevator boot.

Furnished in lengths to suit your requirements, with horse power, speed jacks or belt attachment, and telescoping delivery spout.

Louisiana Dairymen's Co-operative Incorporates

(Continued from page 166)

pects to do is settle the price question for the winter. It is not believed any trouble will be experienced in this for the consumers pretty well understand the problems the farmers are facing these days. A number of city people representing consumers' organizations have gone to the trouble of investigating the milk production proposition on the farm and for the most part have been convinced that the dairymen are not asking for unreasonable prices. No strike or even a threatened strike is anticipated this year. The board is simply going to the distributors and saying: "We have 6,500 gallons of milk per day. Our price is so much. Do you want it?" Of course they will want it. But in case they don't, there are 23 creameries in Mississippi that do. And there are a lot of 17-cent hogs to fatten, too.

Then the association will start rebuilding the dairy industry. And that will be some job! It is not necessary to discuss the lax methods employed by southern dairymen. The whole story can be grasped in these few words: Poor cows, poor equipment, poor system, and lazy dairymen. A campaign is already outlined to improve all of these conditions, and when something real has been done we may give the results in these columns.

Louisiana. R. G. MILLER.

Value in Milk Producers' Organizations

(Continued from page 156)

go elsewhere and buy cheaper milk. It is also claimed that high testing milk is not profitable to buy and this condensery was in the region where milk tests are high. It is stated that if the milk is too low in test for condensing, the fat can be advanced cheaper by the use of butter than to pay forty cents a pound for fat. I do not know about this but the statement is made. For city consumption milk is desired that tests rather low in fat. It is unsafe to skim now and so it is not wise to open the condensery as a shipping station where tests run too high. If these statements are true it is bad news for Jersey men. Perhaps some really good way may be found to standardize milk and the law passed.

New York. H. H. LYON.

Dairy Products at Cattle Congress

The executive committee of the Iowa State Dairy Association at a recent meeting decided to open the dairy products exhibit at the Dairy Cattle Congress held at Waterloo, Iowa, Sept. 30 to Oct. 6, to all states. The premium lists were materially increased over what they have been heretofore. All premiums will be given in the form of War Saving Stamps.

There will be three classes for that made from gathered cream butter, that made from whole milk, and that made at plants which are manufacturing navy butter. The navy butter class is new and is added because the sweet butter cannot be judged accurately in competition with that made from refined cream. Attractive premiums will also be offered for Cheddar cheese and cottage cheese. The Iowa State Dairy Association convention will also be held in connection with the show.

SILOS for This Year's Crop

Erected without Delay. Ready for Silage Immediately.

THIS year, of all years, you owe it to your country and to yourself to turn your corn crop into silage. Don't think it's too late to get a silo. You can have the kind of silo which 60,000 successful farmers consider the best and have it ready for your present crop. Being the largest silo manufacturers, we have your

INDIANA SILO

on hand ready to ship. You are assured of quick transportation. The silo will reach you promptly. You'll find it easy to erect. You'll have your silo up and ready in ample time.

The Indiana Silo is built of materials which are free from defects, and which do not cause or permit the ensilage to become moldy at the walls of the silo. Staves have tight mortised joints and are interchangeable, making the silo easy to erect. There is no metal spline at the joints to rust out or complicate erecting.

It doubles the feeding value of your corn crop, enables you to keep 50% more cattle on your farm, and get an increased milk flow during the feeding season.

Write to nearest address at once for catalog and full particulars showing how easily you can pay for and make money on an Indiana Silo *this* year.

Burn Brae Jerseys

Bull calf dropped Dec. 5th, 1917

Sire:—Ibsen's Chief 135749, Majesty and Raleigh breeding. His dam has a record of 636 lbs. 10 oz. "Chief" won first as calf, yearling and two-year-old, two championships and Gold Medal. *Dam:—Oxford's Majesty's Chance 357046.* Now on test. Her dam is also a R. of M. cow. Other bull calves and bulls ready for light service. Guaranteed to please.

CHAS. A. PETERSON, Rosendale, Wis.

Registered Jerseys

We raise 15 to 20 calves yearly, consequently have an equal number to dispose of from the herd.

Now for sale—six bulls, 2 to 9 months old; two heifers, 10 and 11 months old; all sired by Imported Grandson of Noble of Oaklands. Also four or five fine 3-year-old cows, now milking. **E. G. Roberts, Proprietor.**

Roberts Poultry Farm, Ft. Atkinson, Wis.

CEDAR SIDE JERSEY FARM

Offers for sale a grandson of Royal Majesty, 7 mos. old. Also two bull calves 3 mos. old sired by Permithorpe's Knight, a son of Permithorpe's Raleigh, and out of a daughter of Gamboge Knight. Dams of both calves are in Register of Merit.

P. G. WARMINGTON, Honey Creek, Wis.

JERSEY BULL CALF

STRAIGHT ISLAND BREEDING. Dropped March 18, 1918, solid color. Sire—Imp. son of Noble of Oaklands. Dam—Granddaughter of Derry's Golden Jolly and St. Clairs Fox—in R. of M. class A. A. 642.92 lbs. butter.

Ceylon Court Farm, Lake Geneva, Wis., G. D. Gilbert, Supt.

JERSEY BULLS

Valley Farm is offering young bulls from 2 mos. to 18 mos. old, sired by Noble of Avranche 92571 and Golden Maid's Viscount 113344, both Imported sires. Will sell cheap to make room. Write

FRED STUBLEY. BLACK EARTH, WIS.

REGISTER MERIT JERSEY HERD

At Head, *Mona's Jacoba Premier* grandson: *Pogis 99th of Hood Farm.* Dam, *Mona's Jacoba,* record 808 lbs. butter; Granddaughter, *Jacoba Irene,* young stock; *St. Lambert* breeding for sale.

R. C. GREEN & SON, ALBION, WIS.

Register of Merit Jerseys

We bred the highest record Jersey Cow in Wisconsin. Our cows won prizes in the Wisconsin Dairy Cow Competition. Our sires are well known. We have the best of breeding. Our herd bred for type and production. Send for pedigrees, etc.

We Offer An Exceptional BULL CALF

Dropped in December 1917

Sired by Majesty Star out of a Register of Merit Dam. For particulars, address

FINCH FARM, - DAYTON, OHIO.

POLLED JERSEYS

Breeders' names and Spillman's "Inheritance of the Poll Character in Cattle" mailed free.

CHAS. S. HATFIELD, Sec'y, R 4, Box 5, Springfield, Ohio.

FOR SALE

1 to 14-mos.-old bull calves with R. of M. dams having records from 282 to 492 lbs. fat. Class A. A.

14-month-old bull calf by a grandson of Noble of Oaklands (Dam, a 572-lb. cow). Sire, of 6 bulls Irene's Jacoba Premier 123720, a brother to Jacoba Irene, a former World's Record cow. Prices reasonable.

Byron E. Skillings, R. No. 5, Springfield, Ohio.

The Blood and the Bull

You should head your herd with a grandson of

Gamboga Knight

His dam, granddaughter of Oxford You'll Do. She is faultless in conformation, solid golden fawn heifer giving 38 lbs. 5.4 milk as two-year-old on herd feed. This calf is right in every way, was dropped Mar. 26, 1918, will be solid dark golden fawn, has the production, size and type. He is an exceptional calf and one that you will be proud to own. First check for $150 gets him, with all papers, crated and loaded. Act now.

MEADSIDE FARMS, - Meadville, Pa.

Lookout Farm Jerseys

A Rare Opportunity Is Offered

to secure a fine young bull carrying a large percentage of *Sophie's Tormentor* blood. Solid color; dropped May 9th, 1917.

SIRE. Raleigh's Lookout Torono, 136362, who has 37½% of the blood of Hood Farm Torono, and whose dam, grandam, and great grandam are all in the Register of Merit; and each of them has given over ten thousand pounds of milk in a year.

DAM. Laddie's Prize, 317532, a fine young Register of Merit cow, whose dam, grandam, and great grandam are also in Register of Merit. Price reasonable considering quality.

Henry S. Redfield, 1925 Seventh Ave., New York City.

Golden Sunset JERSEYS

We have a few elegant young bulls nearly ready for service at $100.00 each. The famous Blue Belle-Golden Rosebays.

The Ennis Stock and Dairy Farm, Horine, Mo. (Just south of St. Louis.)

Depraved Appetite

Please tell me what to give my cows. During the early part of the season and somewhat yet they were salt crazy, never could get enough. Now they chew old bones, but mostly gather around an old crumbling wall and eat at the broken up mortar.

Lyons, Wis. A. R. S.

Allow free access to salt and slaked lime and add wheat bran freely to the ration. If that does not suffice, mix bone meal or precipitated phosphate of lime in the feed twice daily, starting with two teaspoonfuls and increasing the dose if found necessary.

Jersey Cattle Notes

For week ending Aug. 9, 1918:

Number of animals registered: Bulls, 146; cows, 343; total, 489. Number of transfers recorded: Bulls, 124; cows, 420; total, 544.

TWENTY Guernsey — TWENTY IMPORTED
GUERNSEY HEIFERS
Will be offered at a SPECIAL PRICE if taken in lots of eight or ten head.

These heifers were recently imported, are very high class individuals and of the best Island breeding.

They range in age from 11 to 30 months, about three-quarters of the number are bred, balance open.

It is getting more and more difficult to import Guernseys and it will pay anyone to investigate this offering if they wish to add a few imported heifers to their present herd.

J. A. Leach, 203-205 Savings Bank Bldg., Cortland, N. Y.

M. & P. Holstein Bull Calves

Sired by a bull whose 10 nearest dams average 29.20 lbs. of butter in 7 days. Price $50.00 and up. Send for pedigree today.
MARKHAM & PUFFER, - AVON, N. Y.

Your Last Chance!

To Get a Son of The World's Greatest Sire
KING OF THE PONTIACS

We have only a few left. Here is a beauty born April 20, 1918, about three-quarters white, out of an 18.82-lb. three-year-old whose sire is a $4,000, 40-lb. grandson of King Segis. Think of this combination of breeding. King of the Pontiacs and King Segis. First check for $500 takes him.
Geoffrey Burlingame, Cazenovia, N. Y.

Soon Ready for Service

Young Holstein bulls from good Official Record dams and sired by SPRING FARM KING PONTIAC 6TH. Fourteen of his first sixteen two-year-old daughters last winter each made better than 20 lbs. of butter in seven days; a showing never before equaled by the first two-year-old daughters of any other sire. These young bulls are nice straight, thrifty, desirable animals. We would be glad to write you full particulars. You will be surprised that our prices are so low for so much quality.
Henry Stevens and Son, - Lacona, N. Y.

Lakeside Herd
Best Bulls For the Money

State about amount to be invested, with quality required. I will describe the best for the amount. Large number of females to select from, all ages. Highest individuality, large production, best type, best udders are characteristics of Lakeside Herd. **E. A. POWELL, Syracuse, N. Y.**

Springdale Farms
Grade Holsteins

Our herd consists of nearly five hundred head and they are all FOR SALE. We are prepared to furnish carload lots of fresh cows, springers or cows due to freshen this fall, also two and three-year-old heifers. If you want large, heavy producing cows it will pay you to see our stock. You will find our prices right. **F. P. SAUNDERS & SON, Cortland, New York. Office 50 Clinton Ave. Telephone 116 or 1476M.**

A Rare Chance

To secure a few choice
Grade Holstein Cows

Just fresh and due within a few weeks. These cows were selected to furnish milk for a famous summer hotel which is soon to be turned into a Government Hospital. They are a very fine lot and will be sold in numbers to suit the buyer. There are only a few of this kind in New York State. Wire your arrival. Don't wait to correspond.
River Meadow Farms, Portlandville, N. Y.

You Can Still Get One But Act Quickly

Nearly all of our sons and grandsons of Pietertje Hengerveld Segis are sold. A few up to 11 months old from high record dams can be bought yet. Pietertje is the only bull living with 100 A. R. O. daughters and 55 sons. He is the best Segis sire living. Prices to suit you.
Susquehanna Farms, Hartwick Seminary, N. Y.

Ormsby Jane King 2nd

Two Nearest Dams Average 35.64

Ready For Service

HERE IS AN OPPORTUNITY for some small breeder to get a sire of exceptionally rich breeding and splendid type at a very reasonable figure.

ORMSBY JANE KING 2nd was a year old June 24th. He carries a straight topline and is nicely marked.

HIS SIRE, ORMSBY JANE KING, is a son of the "Great White Heifer", Ormsby Jane Segis Aaggie, who has a record of 46.33 lbs. butter and 879 lbs. milk in 7 days.

AS A FOUR-YEAR-OLD she broke the world's records by producing 44.42 lbs. in 7 days and 183.16 lbs. in 30 days.

NO OTHER COW IN THE WORLD has ever made two records above 44 lbs.

ORMSBY JANE SEGIS AAGGIE has a three-quarter sister, Ormsby Jane Piebe, with 38 lbs. in 7 days.

ORMSBY JANE KING'S dam and two nearest dams of his sire average 37.16 lbs. butter in 7 days and 147 lbs. in 30 days. Nothing left to be desired on the sire's side of the pedigree, is there?

THE DAM OF ORMSBY Jane King 2nd is Moneta Pietje with a record of 24.95 lbs. butter in 7 days.

SHE IS A SISTER TO Agnes Pietje and Ilmata Pietje, both with seven-day records above 34 lbs. as three-year-olds. Another 3-year-old sister made over 31 lbs.

THE DAM IS SIRED BY Hillside Della Pender Pietje who has three daughters with records from 31 to 34.86 lbs. as three-year-olds and six three-year-olds averaging above 30 lbs.

THE NEXT SIRE IS Woodcrest Pietje with 60 A. R. O. daughters, over half of them having over 20 lbs.

SO YOU SEE both sides of the pedigree are full of great sires and producing dams and besides this Ormsby Jane King 2nd is one of the first grandsons of the "Great White Heifer".

WRITE US TODAY FOR pedigree and full particulars.

Milford Meadows Stock Farm

Now Offers For Sale

M. M. Rag Apple Oak Denver

A most promising young sire, born June 4, '17. Nearly half white and an exceptionally good individual.

His sire is Dutchland Creamelle Denver Prince, a 36.25-lb. grandson of Colantha Johanna Lad.

His dam, Milford Josephine Oak DeKol, made 22.82 lbs. butter as a junior 2-year-old in June. Her sire is a son of Canary Paul Fobes Homestead and from a 29.55-lb. daughter of Homestead Junior DeKol. Her dam, 31.77 lbs. butter, 616.2 lbs. milk, is a granddaughter of Dutchland Sir Pontiac Rag Apple.

The three nearest dams of this young sire average over 30 lbs., one a junior 2-year-old. His dam is one of our good prospects and is to be retested this winter.

Milford Meadows Stock Farm, - Lake Mills, Wisconsin.

73—HEAD—73

Holsteins At Auction

SEDALIA, MISSOURI

Thursday, Sept. 5th, 1918

AT MISSOURI STATE FAIR GROUNDS

Pettis County's First Annual Combination Holstein Sale

73 HEAD of Pure-bred and Grade Holsteins will be sold owing to the great drought and consequent shortage of feed, and to the fact that the men are closing out their grade herds to make room for pure-breds, as Pettis County has been made the center of the Pure-bred Holstein Industry of Missouri.

Included in the sale are 41 grade females from bred yearlings to mature cows part of them springers, 15 grade heifers, open yearlings and calves and a large number of pure-bred bulls and bull calves from a few months to over a year old.

Everything over 6 mos. of age will be tuberculin tested. Every animal must be just as represented or no sale.
Under the Auspices of the **Pettis Co., Missouri Bureau of Agriculture, U. S. Dept. of Agri., Missouri College of Agri., and Pettis County Court, Co-operating.**
For further information, address C. M. Long, County Agent, Sedalia, Mo. Col. C. J. Hieronymus, Sedalia, Auct.

Beaumont Farm, Mt. Savage, Maryland

Our herd sire is KING COLANTHA RAG APPLE, son of Rag Apple Korndyke 8th. His dam is a 30.51 lbs. at three years; granddaughter of Colantha Johanna Lad. *Could you imagine a finer combination?* We consider him one of the best bulls Mr. Cabana ever sold. In build and conformation he is the admiration of everyone who sees him.

We have a son of his, born April 18, 1918, a beauty in every respect; beautifully marked, more white than black; straight in every way. He is out of Van Briseis Pontiac Asiatic 32.60 lbs., a granddaughter of King of the Pontiacs.

This bull will be sold at a reasonable price, and will be worth $2,000.00 when he is ten or twelve months old.

King Pontiac Champion

Leads All A. R. O. Sires

King Pontiac Champion, (81 A. R. O.) has the best balanced A. R. O. record of any living bull of the breed.

He does not depend upon a few sensational daughters for his prestige but upon the high average production of his get. His daughters excel in both long and short tests as well as in milk and butter.

Last year King Pontiac Champion led the 589 sires represented in the prize list by being represented 34 times, and in respect to 30-lb. daughters, did not even have a rival. The showing of his semi-official yearly daughters in both milk and butter also far surpasses that of any other sire.

Think of the 125 daughters of King now on the Pabst Stock Farm, 81 of which have already been credited with A. R. O. records, and the fact that King Pontiac Champion is now in his prime.

Is not this the kind of a sire to line up with when selecting a herd sire? Look over our list of young bulls—prices reasonable.

PABST STOCK FARM,
Oconomowoc, Wis.

Walcowis Farms

OFFER SON OF

IOWANA SIR OLLIE

Sire of state record jr. 2-yr.-old. Dam, a granddaughter of King of the Pontiacs and first prize winner at National Dairy Show, made 27.70 lbs. butter from 624 lbs. milk in 7 days. Best day's milk, 101.5 lbs. Calf was born April 8, 1918, is evenly marked and a splendid individual. Write now for price, pedigree and photo.

GEO. E. STEVENSON & SONS, Clarks Summit, Pa.

Is the Grass Getting Short?

If you are not already one of the thousands of successful dairy farmers who use Krause Dairy Feed to supplement short pasturage, you will find it exceptionally well adapted to your present feeding needs.

If your pastures have dried up altogether and your supply of other green stuff is short, it can be fed alone with splendid results or easily combined with any home-grown grains or green stuffs which are available for immediate use.

Krause Dairy Feed is a complete dairy ration with a protein content of 24% to 25%. Fed alone or in combination with any other feeds it is a sure and consistent money maker that will not only increase and sustain your milk flow but will promote the steady growth of young stock and keep your entire herd in "first premium" condition the year round.

KRAUSE DAIRY FEED

Our claims for Krause Dairy Feed are based on actual results, not theory. Thousands of successful dairy farmers have been feeding it for years, and their testimony has established beyond question that Krause is a high grade reliable feed.

Krause Dairy Feed has been worked out on a scientifically correct basis. Its formula takes into consideration the great variation of feeding requirements in different sections and the necessity of its being adapted to individual needs of cows of all breeds. It's a perfectly balanced combination of nine of the best milk producing feed stuffs obtainable, namely, Distillers Grains, Gluten Feed, Cotton Seed Meal, Wheat Bran, Malt Sprouts, Hominy Feed, Linseed Meal, Brewers' Grains, Wheat Middlings and a small percentage of salt. No other dairy feed on the market is so well combined as to protein content, carbo-hydrates, fat and fibre—is so nutritious, palatable and dependable.

You will find Krause Dairy Feed a twelve-months-in-the-year ration that will completely and profitably meet your feeding requirements. Have your dealer supply you with it now and let your cows give you the testimony that counts the most. Send for free sample, also free record book and other literature.

TRADE BADGER MARK

The Badger Line of Farm Feeds

Dairy Feeds, Stock Feeds, Alfalfa Horse Feeds, Hog Feed, Calf Meal, Poultry Feeds.

Buy Your Winter Feed *Now*

WHETHER you buy Krause Dairy Feed or any other feed, we advise you to lay in your winter stock at once. You will make money because the prices of all feeds are lower now than they will be later.

Furthermore, you will be sure of getting your feed. If you wait until later, shipping delays, which promise to be even worse than last season, may make your supply very uncertain.

The farmer who is obliged to feed his high priced grains this fall and winter will be feeding real money. If he secures his winter supply now he will be saving for himself and helping to relieve the serious freight situation.

Reaching the Housewives of America

KARL B. MUSSER, Washington

HO spends your salary, Mr. Reader? Have you ever figured on is? Of course you spend some of it id you say "yes" to the requests, it some rainy day sit down and fige out just what per cent of your lary you actually spend. You will id that near seventy-five per cent is ing spent by the "Little Wife". nsidering this statement as reprentative this makes your wife and ine a part of the plan be considered in the le of all food prodts. The increasing of e amount of milk nsumed is rather peless as long as she ceives a small portion the facts regarding ilk as a food.

here Do We Find Milk Advertisements

In the face of this ct, as to who spends e salary, we find the ajority of good readg about milk in parrs that men read. ie facts about milk en reach people who ve but twenty-five r cent of the money spend. The "Big ss" in the situation the housewife. It is th her that we must more educational d campaigning work r increased milk conmption. It is the ental attitude of the usewife toward milk at will determine the antity of dairy prodts that will be conmed in the home. If mothers think substitutes are as od as butter and other dairy prods, the dairymen in general, will—they say—"go begging".

The colleges have reached many nes, but a small part of the aggre-e, and in most cases those in rge of the work, have seen the it. It is true, however, that there home demonstration agents that tinue to teach the substituting of er fats for butter. Thinking only erms of money, they may consider h advice sound, but why do these nen and others know so little ut this unexcelled food? It seems the writer that the dairymen and icultural press have expected them come to the man's paper for their wledge on the matter.

Who Consumes the Milk in Your Home?

The fact that most of the milk purchased in many homes is consumed by the children has been gratifying. Statistics show that the amount of milk purchased by families in other than very congested areas is directly in proportion to the youngsters in the family. The medical journals indicate that there are more babies fed cow's milk each year. Men who have been in the certified milk business for years have stated that the majority of their trade has been among the poor classes. Especially is this true of the foreign born. These statements seem to indicate that there has been valuable work done to show the consumer the value of milk. It appears that milk is getting its due. But in general these conditions of "favorable appearance" are of little value to the whole dairy scheme. Where families realize the value of certified milk, their doctor or some live business man in the dairy field has sold them the idea. The fact that children are responsible for the amount of milk that is purchased does not give hopes of great value. A trip through the "East Side" of many of our large cities will tell the story only too well. Malnutrition is prevalent due to a lack of food, good food for growing youngsters, milk. In many homes children are over-eating, due to a lack of proper food to meet the needs of their growing bodies. That food is milk.

There is a belief among housewives that milk is expensive. This conception of the situation is not easily changed. It is a state of mind coupled with the "I read" that we as dairymen have generally overlooked.

Women's Journals Have Been Neglected

Some of the leading periodicals edited for women have printed articles, written by apparent neutral parties, showing certain substitutes to be endowed with vitamines and other properties that we as dairymen know milk alone possesses. In other words, the men in the substitute business are putting their publicity material in the publications that our wives are reading. It is being put in these publications in a clever, but hostile, way.

We have been lecturing, writing, and talking for some time about this wonderful food, milk, to Tom, to Dick, and to Harry. Did they go home and tell their wives about it? Probably, but they told it when the wives were busy or in a hurried way as a report of the day's events. It was never made a part of the reading hour in the home. Until Mrs. Tom, Mrs. Dick, and Mrs. Harry know all the advantages of milk as a food we can not hope to increase the consumption. When your wife and my wife read, talk, and hear these things about milk they will put them into practice.

The agricultural press is so far reaching that many are lead to believe that the women are fairly well supplied with facts. If one hundred housewives are engaged in conversation about milk, there will be a consensus of opinion that milk is too high to use freely. The agricultural press has had many valuable articles regarding milk, but women don't read them. Even farm women read sparingly of such publications. City women have the daily press for their source of knowledge or the demonstrations given for educational purposes. The large number needing this information about milk the most, are those that read little and "go" less. This class generally read the papers they get free one way and another. A field ripe for educational work for the dairyman is in the publications for women. An examination of the last three issues of three journals for women shows information on milk to the extent of several condensed milk advertisements and a small amount of information on the care of milk for infant feeding.

HOGGING DOWN CORN AND SOY BEANS ON FARM OF NOAH FENTS, INDIANA

Milk Has Its Weaknesses

The common knowledge among dairymen about milk as a food causes many to think there are no weaknesses that need consideration.

No weakness is of great enough importance to cause decreased consumption provided the consumer knows the advantages. The perishable character of milk, its bulk, the readiness with which it is digested, the absorbing power, and the fact that it is about the only food coming into the home that has a separate and distinct source of supply are all factors mentioned to the writer by housewives as objections. The perishable character requires special handling; the bulk limits it as a food for adults when consumed in quantities sufficient to form the major part of the diet; the ready digestion when con-

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 6 months, 50 cents; 3 months, 25 cents. Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through Wm. Dawson & Sons, Cannon House, Breams Building, London, S. C., Eng., or their agents, including the news dealers and book sellers in all foreign countries.

Subscription agents for New Zealand—Bray Bros., Agricultural Hall Building, Dunedin, New Zealand. Also—The New Zealand News Co., 150 Wakefield St., Wellington, N. Z.

Subscription agents for Australia—Australasian News Co., 226 Clarence St., Sydney, Aust.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $2.56, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of the Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome immoral and quack advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Educational Features of National Dairy Show

At the National Dairy Show, to be held October 10 to 19th, representatives of the U. S. Food Administration and Department of Agriculture will co-operate with representatives of the Ohio State University, presenting to the public the latest results of science and practice in the preparation of milk and cheese as substitutes for meat; in the use of these same products in the dinner pail of the hardy worker; the lunch box of the school child and the office worker.

The European armies are using cheese because of its high nutritive value, its ease of transportation, and the lack of any preparation required in the trenches. These, and many other aspects of the uses of milk, butter, and many varieties of cheese will be staged in attractive stories at the forthcoming dairy show.

It is expected that the Bureau of Markets will present tangible and interesting evidence of the service which this Bureau is rendering to the dairy industry with its market reports, quotations, consultations, etc.

It is expected that there will be something coming from the recently organized labor board to show what has been accomplished in helping to solve the labor problem for the dairyman.

Dean Van Norman, of the University of California and president of the National Dairy Show, recently spent two weeks in Washington and Columbus, developing the war story of the dairy industry, and if present plans mature, the buildings devoted to the government's war stories will not be the least interesting points to visitors at the forthcoming show.—NATIONAL DAIRY ASSOCIATION.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

Free Verse on City Gardens

I have seen a great many
Of those little city gardens
And it's only just to state
That the folks planting them
Are good intentioned and all that,
And put in queer hills of corn,
And potatoes that are not seed potatoes,
And beans that die hard,
And beets that soon lose heart,
And cabbage that get as high
As the second story windows,
And lettuce
Planted so close together
That it strangles for lack of air,
And parsley and squash
And melons and things,
All of which manage to get
Their heads above ground.
But candor compels me to add
That if all the rest fails
The nation will have enough
Pithy radishes
This year
To supply ourselves and our allies
For two seasons to come.
Bless 'em!
Radishes are the one
Fool-proof crop!

"How is your crop coming along?"

"Poorly, very poorly."

"What's the matter? Too lazy to cultivate properly?"

"No, that wasn't it. I took to reading those 'Monthly Hints to Gardeners.'"

Fables of the Farm

Once upon a time a dairy farmer in a thickly populated section took the stand that everything the Administration did was wrong. He figured that outsiders had no right to fix milk prices, and that tractors cost too much, and that the machinery people were profiteers, and that cream brought away too little in the open market, and that the sons of farmers should not be drafted, and that the income tax was an imposition, and that we should have liked the U-boats long ago, and that wheat prices were unsatisfactory. In fact, he had a list of grumbles as long as the old cow's tail. He kept this up, day in and day out, to everyone who called and everyone he met. Finally, nobody in the county would speak to him and he became the loneliest man in the world.

Moral: Right or wrong, for your government.

National Thrift Week

A week of giving the farmer his due.

A week of telling the people the food value of milk.

A week of praise for blooded stock.

A week of explaining the difficulties of the business.

A week of proving that milk is cheap at any price.

A week of honoring a great industry.

A week of winning friends for dairy farmers.

A week of glorifying the bounty of real butter.

It Does Make a Difference

"Mother, it's lovely out here on the farm. But did you see papa at the breakfast table this morning. There was something wrong with his soft boiled egg."

"What, my dear, what?"

"He didn't smell it."

"Slipping" not "Saving"

"I kept slipping back two feet every time I went ahead one." That's what the small boy gave as an excuse to his teacher for being late for school one winter day.

And that's just what is happening to the cow owner who is trying to get along without a cream separator or with an inferior or half-worn-out machine. Like the small boy he is "slipping." He thinks he is thrifty, but for every dollar he saves by not buying a De Laval he loses two through not having one.

It *isn't* economy to do without labor saving and money saving and food saving machines. It *isn't* economy to feed 40-cent butter to the calves and hogs.

It *is* economy to buy and use only the best cream separator made—and that's the De Laval.

Viewed from every standpoint—clean skimming, ample capacity, ease of operation, freedom from repairs, durability—there is no other cream separator that can compare with the De Laval.

It's real thrift and genuine economy to buy a De Laval Separator NOW.

Why not see the nearest De Laval agent at once! See a new 1918 De Laval machine for yourself. Try it to prove every claim made for it. If you don't know a De Laval agent write direct to one of the addresses below.

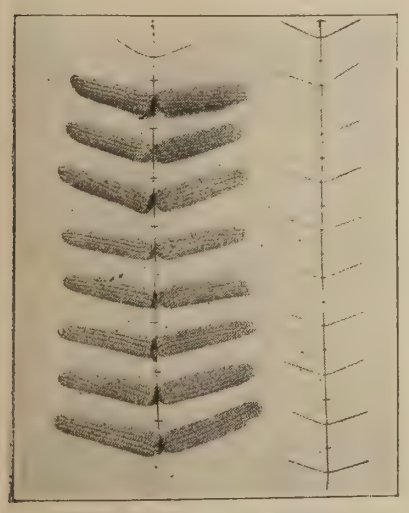
The De Laval Separator Co.

165 Broadway, New York 29 E. Madison St., Chicago

Seed Corn Preparedness

L. F. GRABER, Wisconsin

RIGHT now is the time to prevent a reoccurence of the seed corn famine of last year. Save seed corn not only for next year but for year after next. Save a double supply. Lay in a reserve. Don't take any chances on getting poor seed. Cure it right.



Good Seed From Near-ripe Corn

We don't know what Jack Frost has in store for us this fall, but there is a way of beating him to it. Pick your seed corn early. Ordinarily, we

SELECT SEED CORN EARLY

like to choose ripe ears for seed. They are easier to cure. But A No. 1 seed corn can be obtained from unripe ears any time after they have dented, provided they are handled right. Yes, it is true that dried immature corn is miserable looking stuff—so shrivelled and shrunken you might hesitate to feed it to hogs; but if it has been cured with heat and handled in such a way as to prevent molds, it will make fine, strong, growing seed. Pick your seed corn early, and if Jack Frost lets the rest of your corn ripen, pick more later on. Remember, this is the year to get a double supply—enough for two years. If this were done every year, there would be no seed corn famines.

KEEP EACH EAR SEPARATE

Simple Rules for Safe Seed

The A. B. C. of getting good seed corn, whether it is just dented or fully ripe, is summarized in these five statements.

1. Pick the ears before frosts are cold enough to freeze the husks onto the kernels. If you have such a freeze, chances are your corn is ruined for seed purposes. The husks protect against damage from light frosts which just nip the leaves.

2. Hang up every ear the same day it is picked.

3. Keep every ear separate. Prevent them from touching. This is the only way to escape molds, especially with unripe ears.

4. Put the corn in some well ventilated room—not outside, where it may be frozen before it has completely dried.

5. Hasten the drying with heat from a stove or furnace. This is absolutely essential where large amounts —more than 20 bushels—are cured.

Rapid Drying Pays

It is hard to say which of these rules is most important, but it is safe to say that the value of keeping the ears separate and the importance of using heat for rapid drying is not generally appreciated. If it were, you would not see seed corn decorations on the south side of barns, on windmills, and even on the old apple tree. The strongest germinating and growing seed corn is that dried with heat of a stove or furnace. True enough, good seed corn can be had by curing in well ventilated attics. Here the warmth of the sun during the day aids the drying and at night prevents freezing by frosts. The attic is a hot, dry place, ideal for curing seed corn in small amounts. With large amounts of seed corn, artificial drying with heat and perfect ventilation is absolutely essential for safety and success.

GET A TWO-YEAR SUPPLY OF SEED CORN THIS FALL

SELECT SEED EARS

How Fast Does Your Corn Grow

The importance of proper curing can only be appreciated by comparative tests of the same variety of seed corn cured under different conditions. I have seen fire dried seed corn that after planting grew with twice the vigor and rapidity as did the same seed cured on the south side of the barn. It pays to give attention to seed corn. Last year's experience should be a lesson.

Strawberries and Grease

(From the Orange County, New York, Farm Bureau News)

Let us talk of strawberries and grease.

If you were a strawberry grower in the town of Newburg when strawberries were plentiful and the price no more than sufficient to pay expenses, would you think it a good thing to sell your strawberries in toto and for your own table buy dried prunes, because the prunes happened to be a few cents cheaper? Would you, for the sake of the few cents saved, perform the act of directly undermining your business? That is just what the dairymen in considerable numbers are doing in this county and in this state today. They are producing milk for a living and selling on a market that is simply supplied and at a price that is just sufficient, and hardly that to pay some of the necessary costs of the business. Their neighbors, the dairymen in other states, manufacture their milk into butter.

Butter and its price have a direct bearing upon the price and production of fluid milk. The price of fluid milk has a direct bearing upon the price and production of condensed milk, of cheese, dried milk, and other milk by-products. One is dependent upon the other. When the dairyman in this section does anything to hurt the dairyman in Wisconsin or Indiana, he hurts himself. That is what dairymen by the thousands are doing now, they are hurting themselves. They are doing it by buying oleomargarine, butterine, nut margarine, and other deodorized grease gathered from the four corners of the earth and camouflaged under the term of a spread for bread.

Oleomargarine and its tribe are travesting upon the name of butter. Butter must be in them to make them palatable enough for sale. The grease from unknown animals, the oil from cottonseed, and the tortured fats from half a dozen industries must be enlivened and flavored with nature's own product, butter, before they can be offered to the public as endurable. Scientists tell us that these mixtures of an astute commerce contain nearly the same food value as does butter. For the matter of that, meat from the shin bone of an ox compares favorably in food value with sirloin steak. But as for digestibility, no scientist or doctor will tell you that oleomargarine should be given to the growing child. Like all grease, it is heavy and unresponsive until attacked by a vigorous,well developed digestive system.

The farmer may save a few cents for the time being, but these cents, few as they are, are taken from the pocket of his hard worked colleague in the butter producing section of this democracy. The tiller of the soil, be he dairyman, fruit grower, onion grower, or plain farmer, if he buys oleomargarine or any of its nutty clan for use on his own table, is taking bread from the hands of his family and digging a hole under his business.

CURING SEED CORN CN THE SOUTH SIDE OF A BARN IS RISKY

WISCONSIN SEED CORN CURING HOUSE

It has a capacity of 800 bushels and is equipped with furnace and special ventilating fans for rapid drying.

The Illinois State Fair

ONE hundred years ago Illinois was admitted to the Union as a state. She celebrated her hundredth birth year August 9 to 26 in the Illinois Centennial State Fair and Industrial Exposition. The live stock exhibits were made during the week of August 19 to 24.

Since 1818, Illinois has made an agricultural development almost beyond measure. Her contribution to the world's food supply one hundred years ago was insignificant; her pioneers did well to secure food and clothing for themselves though some little produce was sent out of her borders. For the most part her acres were untouched and her storehouse of soil fertility unopened

In 1918 Illinois has an agriculture with a total value, when her acres, equipment, and improvements are considered together, of about $4,000,000,000. Her 1917 production of grain crops and live stock constituted a wealth of more than $840,000,000. The U. S. Department of Agriculture in its estimates for last year gave Illinois rank as the premier food producing state of the Union, the total value of her farm output excelling that of any other commonwealth.

MINERVA BEETS, SENIOR AND GRAND CHAMPION HOLSTEIN COW AT THE ILLINOIS STATE FAIR
OWNED BY R. E. HAEGER, ILLINOIS

Illinois' cornfields cover 10,000,000 acres and produce 400,000,000 bushels of grain; her 4,500,000 acres of oats yield annually 200,000,000 bushels; from her 1,500,000 acres of winter wheat, 30,000,000 bushels of the bread cereal are harvested; a cut of 4,500,000 tons of hay is cured from 3,000,000 acres.

Illinois counts her live stock worth $400,000,000. Her dairy cows are valued at $75,000,000 and are credited with an annual milk production worth $50,000,000.

Of the agricultural virtues of this farm of Uncle Sam's, stretching from Indiana to the Mississippi and from Wisconsin to the Ohio, H. E. Young of the Illinois Farmers' Institute well says, "The Almighty might have made a better land but He didn't".

Illinois is deserving of an agricultural fair given more largely to farming interests than has been the case, though in many particulars the 1918 fair and exposition was an improvement over the previous exhibitions. Politics has thrived so well about Springfield that it has encroached too much upon things of more importance agriculturally. The excuse and reason for holding fairs at this time is that agriculture may be further stimulated by them. Nothing should be allowed to interfere with this purpose.

Those who have labored to make the Illinois State Fair more truly reflect the agricultural progress of the state, report with much satisfaction the action of the 1917 legislature which did away with 119 commissions, taking the state's administration work out of politics and placing it under 7 departments, one of which will direct the policies of the state fair. Another year, these men say, a live stock man will have charge of live stock exhibits and a dairy farmer will supervise the exhibit of dairy cattle. This may have the effect of increasing the number of exhibitors.

University Exhibit

Many a farmer pondered over a choice between two cows selected from Illinois cow testing associations to illustrate the necessity of the test in judging productive capacity. And as many decided on the wrong animal, one which made 3,788 lbs. milk, 197 lbs. of fat in a year, as on the higher producing cow with a year's credit of 9,138 lbs. milk, 413 lbs. fat. To make certain that the conditions under which the records were made were fair to each cow, the two were taken into the university herd and given similar care. In 140 days after freshening the cow selected as the better one of the two by fair attendants made 3,821 lbs. milk containing 179 lbs. fat. The other in a like period produced 6,430 lbs. milk, 264 lbs. fat. The same two cows were used at the 1917 fair.

The statement was made that in the last year Illinois associations have discovered 1,000 "slacker" cows, indicating that without the test the same mistakes are made in the selection of cows on farms as were made at the fair.

Four bull calves and four cows were exhibited as typical specimens of the four main dairy breeds.

The Carterville Jersey Breeders' Association, which has the first bull association in the state, brought its lesson of co-operative bull ownership to the fair—that others might profit also. Three grade cows and their three heifer calves, sired by bulls owned and managed co-operatively by the several association members, were shown. Two of the sires now used in the association were exhibited. The value of the lesson would have been much clearer if the production of the dams and their daughters in such an association could have been indicated—proving an increase through the use of pure-bred sires and showing the low cost of sire service to small herds under the working of a bull association. A chart comparison of daughters with their dams was given which well illustrated the increased returns through having the dairy herd sired by a pure-bred bull. Figures for two years were given of results from the use of three bulls. The first bull's daughters in the first year, 1916, averaged 62.2 lbs. fat more than their dams, and in the second year, 39 lbs. more. Similar figures on the second bull were 52.2 lbs. and 55.8 lbs. and, on the third bull, 115.5 lbs. and 93.8 lbs.

LESSONS IN COW TESTING AT THE ILLINOIS STATE FAIR

A dairy cow was displayed in the dairy building with the following inscription on the wall beside her: "Do you know me? I am a dairy cow. I am the foster mother of the human race. It is my business to eat corn silage, hay, and grain, and convert these feeds into milk and butterfat, nature's most perfect food. Last year I produced 18,000 lbs. of milk which contained more digestible food than the carcasses of five steers, each weighing as much as myself. This year I expect to do the same thing. My sisters and I are more economical producers of human food than any other class of live stock. Use more of this valuable food we produce. We will help win the war."

A rather complete set of comparisons of the value of milk and its products with other foods was made. Demonstrations of manufacturing processes were made. The showing of dairy products was very small, less than fifty samples of butter came in and but a few of milk. The quality partly made up for the lack of number of entries.

Every dairy farmer at the fair should have studied carefully a chart captioned: "Herd cost of producing 100 lbs. of milk". It gave the following figures from actual surveys made. It cost these Illinois dairymen whose farms were studied: for the 6 summer months, 2.36 hours labor, 32.8 lbs. grain, 18 lbs. hay, 6 lbs. dry forage, and 148.9 lbs. silage; and for the winter 6 months, 2.78 hours labor, 53.9 lbs. grain, 67.8 lbs. hay, 60.5 lbs. dry forage, and 233.1 lbs. silage. Even though these data represent the present farm practice they are clearly at great variance with the best of dairy practices. A second chart gave the basis for the price setting for milk produced until January 1, 1917. This is for the production of 100 lbs. milk: 20 lbs. home grown grain, 24 lbs. of purchased grain, 100 lbs. hay, and 3 hours labor.

Live Stock Show

All in all, the live stock exhibit was fully up to standard, both in quality and numbers, in spite of labor shortage and high freight rates and feed costs. The horse show was very light and sheep were below normal. Beef cattle were represented strongly and hogs were exhibited in good numbers.

The showing of dairy cattle was considerably above average. Not only were there more animals of the dairy breeds on the grounds but the quality was better than has usually been the case. A few unworthy individuals were led into the ring but the ribbons of high value went to well fitted animals of approved type.

Two judges, L. S. Gillette of Iowa and A. C. Oosterhuis of Wisconsin, placed the five breeds very satisfactorily to onlookers and to exhibitors.

Holsteins

Exhibitors: R. E. Haeger, O. P. Hopping, and J. H. Diehl, all of Illinois.

Judge: A. C. Oosterhuis.

Whenever Paul Calamo Korndyke and Minerva Beets are led out, there's a Holstein show. Alone, they make a notable exhibit for the black and white breed. At Illinois, they were shown with 19 others from the Haeger herd, 13 owned by Mr. Diehl, and 10 by Mr. Hopping, making a total of 44.

The old show ring veteran, Paul Calamo Korndyke, starts the season in splendid condition and will make stiff competition for the best brought out. At this first exhibition he met no close contender on his way to grand championship. The record of this bull is made especially noteworthy by the

PAUL CALAMO KORNDYKE, SENIOR AND GRAND CHAMPION HOLSTEIN BULL AT THE ILLINOIS STATE FAIR

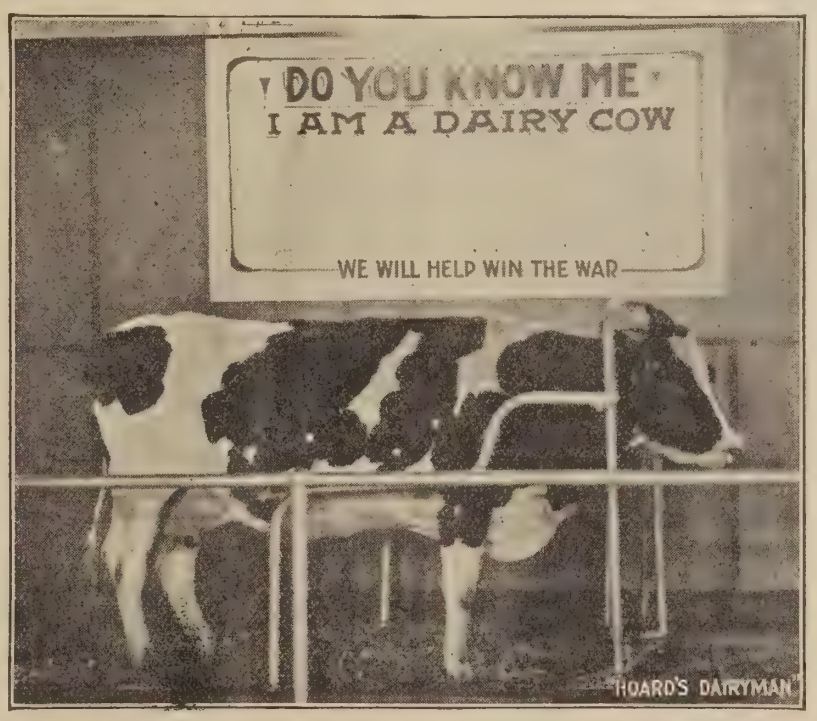
CAVALIER'S KILNFORD DOROTHY, SENIOR AND GRAND CHAMPION
AYRSHIRE TWO-YEAR-OLD AT THE ILLINOIS STATE FAIR
OWNED BY ADAM SEITZ & SONS, WISCONSIN

winnings of his get in the younger classes. In the junior bull classes the Haeger herd was represented by an unusually showy junior calf, King Segis Pontiac Calamo. A threatening droop back of the shoulders made him a loser and gave Mr. Diehl a purple on Rag Apple Korndyke Segis Echo.

This is Minerva Beets' sixth round of the circuit. She was grand champion at the 1913 National and ever since, when shown in milk, has maintained her place as leader of the females. She is every inch a show cow and well deserves the premier ribbon awarded her at her first 1918 show. Prilly Clothilde DeKol, her stable mate, freshened the day before being shown and evidenced the effects. She will finish into a very able supporter of Minerva Beets later in the season, however, and is fully qualified for the championship in strong competition, if the old ribbon winner is left in her stall. Calamo Nancy Spofford, a yearling from the Haeger herd, was made junior champion.

Of the three Holstein herds exhibited, the Haeger cattle were splendidly fitted and shown. A larger number of animals would have much better indicated the herds in Illinois.

The list of awards follows:



Bull three years or over:—1 and 2, Haeger on Paul Calamo Korndyke and Johanna McKinley Segis 4th. Bull 2 years and under 3—1 Haeger on Pearl King Segis Pontiac. Bull 1 year and under 2—1, Diehl on Rag Apple Korndyke Segis Echo; 2, Haeger on Aconeth King Segis Pontiac; 3, Hopping on Case King Acme Pontiac. Bull calf 6 mos. and under 12—1 and 2, Haeger on Paul Minerva Korndyke and King Segis Pontiac Cassie; 3, Hopping on Walker Pontiac DeKol. Bull calf under 6 mos.—1, Haeger on King Segis Pontiac Calamo; 2, Hopping on Crest DeKol Butter Boy; 3 and 4, Diehl.

Cow 3 years or over—1 and 2, Haeger on Minerva Beets and Prilly Clothilde DeKol; 3 and 4, Hopping on Model Aaggie Pontiac and Alta Wagner Burke Inka. Cow 4 years and under 5—1, Haeger on Aconeth Lady Hengerveld; 2, Hopping on Case Grace Walker. Cow 3 years and under 4—1, Haeger on Nancy Calamo Korndyke; 2, Diehl on Diehl DeKol Pontiac. Heifer 2 years and under 3—1 and 2, Haeger on Lady Calamo Hengerveld and Tantalus Calamo Korndyke; 3 and 4, Hopping on Case Princess Pontiac and Case Abbie Pontiac; 5, Diehl on Diehl Segis Pauline DeKol Korndyke. Heifer not in milk, 1 year and under 2—1, 2, and 3, Haeger on Calamo Nancy Spofford, K. S. P. Evelina, and K. S. P. Bridget Korndyke; 4 and 5, Diehl on Diehl Segis Korndyke DeKol Cornie and Diehl Segis Pontiac Pauline. Heifer calf 6 mos. and under 12—1 and 2, Haeger on K. S. P. Beets Jessie and Calamo Aconeth Korndyke; 3 and 4, Hopping on Mucilage Bertha Hengerveld and Lady Constance Pontiac; 5, Diehl. Heifer calf under 6 mos.—1 and 2, Haeger on K. S. P. Lady Calamo and K. S. P. Tantalus Calamo; 3, Diehl.

Dairy Herd:—1, Haeger. Exhibitor's Herd—1 and 2, Haeger. Breeder's Young Herd—1, Haeger; 2, Diehl. Calf Herd—1, Haeger; 2, Diehl. Get of Sire—1 and 2, Haeger; 3, Diehl. Produce of Cow—1, 2 and 3, Haeger.

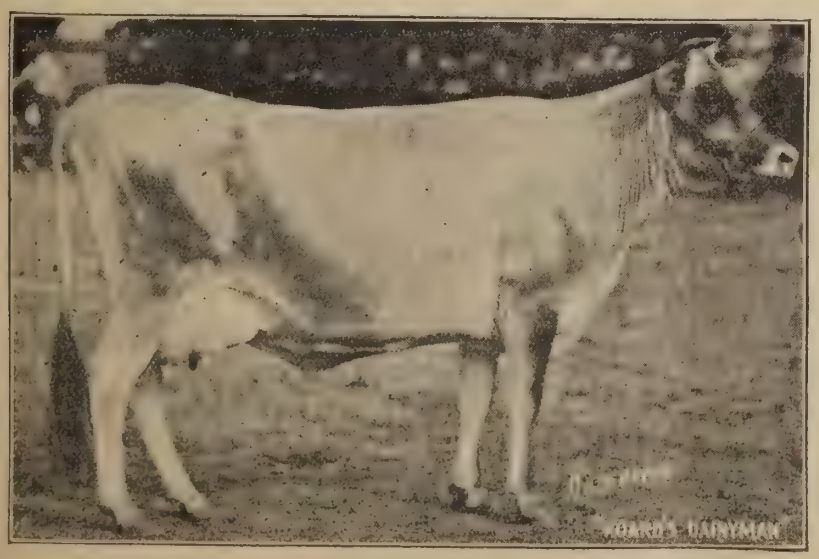
Senior and Grand Champion Bull—Paul Calamo Korndyke. Junior Champion Bull—Rag Apple Korndyke Segis Echo.

Senior and Grand Champion Cow—Minerva Beets. Junior Champion Cow—Calamo Nancy Spofford.

HOLSTEIN COW KEPT BEFORE THE STATE FAIR VISITORS OF THE DAIRY BUILDING

The inscription on the wall above the cow added a great deal to the value of the display. It read as follows: "Do you know me? I am a dairy cow. I am the foster mother of the human race. It is my business to eat corn silage, hay, and grain, and convert these feeds into milk and butterfat, nature's most perfect food. Last year I produced 8,000 gallons of milk which contained more digestible food than the carcasses of five steers each weighing as much as myself. This year I expect to do the same thing. My sisters and I are more economical producers of human food than any other class of live stock. Use more of this valuable food we produce. We will help win the war."

Brown Swiss



It may be said of the two Brown Swiss breeders whose animals were passed on by L. S. Gillette that the 26 head they showed made up the best exhibit of dairy cattle at the fair in fitting and show conditioning. Every entry was brought out in show shape. The advertising done for the breed was praiseworthy.

Hull Bros. with twenty head won the bulk of the prizes, being awarded all firsts and, consequently, all championships. Their aged bull, Dick of Lake View, was in splendid form and was given his customary grand championship. Swiss Valley Girl 7th was shown dry and therefore did not have her usual strength against contenders. She was awarded grand championship after defeating a very worthy rival among the milk classes and a splendidly put together junior calf, Cinderella of Lake View, a popular junior champion.

Ayrshires

Two Wisconsin exhibitors, Adam Seitz and Sons and Jas. Van Etta exhibited thirty-eight Ayrshires as a representation of the red and white dairy cattle. A. C. Oosterhuis acted as judge.

Wherever the Seitz herd is led out an Ayrshire show is assured. They went it alone at Springfield in 1917 but had very worthy competition this year from the Van Etta line-up, which the week before battled the veteran herd at the Missouri State Fair in company with C. H. Peverill of Iowa.

Barrett Everlastic Roofings

For *Every* Kind of Steep-Roofed Building—

The name "Barrett" is known wherever roofing and roofing-materials are used.

Our most famous product in this line is Barrett Specification Roofs. *They cover most of the large permanent flat-roofed structures of America.*

Equally satisfactory in *its* field is our Everlastic System of Roofings, for *steep-roofed* buildings of every kind, including residences, garages, factories, and farm-buildings of every kind.

The Everlastic System includes roll-roofings in the popular "rubber" type, or with a beautiful crushed-slate surface in either red or green. Also individual and strip-shingles, slate-covered, in colors.

The Everlastic Roofings are all low in price and economical to lay.

Below follows a brief description of each. Don't fail to read it—and more important, don't fail to see this famous line at your dealers.

Everlastic "Rubber" Roofing

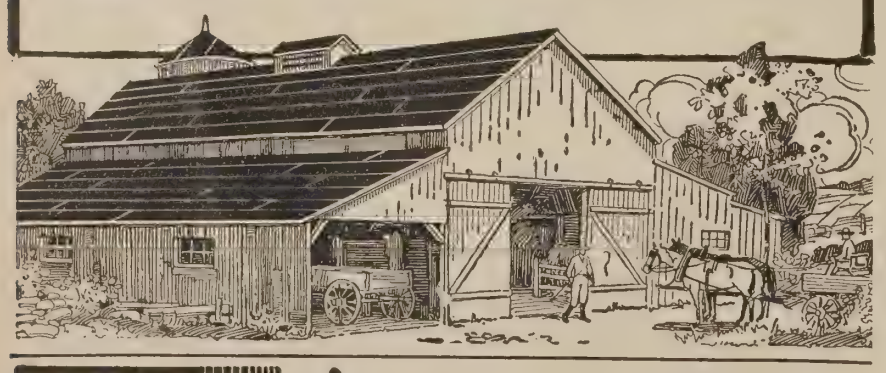
This is our most popular line and thousands upon thousands of buildings all over the country are protected from wind and weather by Everlastic "Rubber" Roofing. It is tough, pliable, elastic, durable, and very low in price. It is also easy to lay, no skilled labor being required.

Everlastic Slate-Surfaced Roofing

This is the most beautiful and durable roll-roofing made. It is manufactured of the same materials as Everlastic "Rubber" Roofing but has a beautiful surface of real crushed slate, either red or green. Fire-resisting and very durable.

Everlastic Multi-Shingles

This is the newest thing in roofing, being *four shingles in one.* When laid they look exactly like individual shingles and make a roof worthy of your very best buildings. Being four shingles in one, they save a great deal of time in laying and require fewer nails. Red or green surface of real crushed slate.



Everlastic Tylike Shingles

These are made of the same material as the Multi-Shingles (red or green) mentioned above but come in individual shingles. The finished roof is far more beautiful than one of ordinary shingles, and costs less per year of service.

BOOKLET FREE Write for booklet describing these roofings and also other Barrett Specialties that you constantly need.

The Barrett Company — New York, Chicago, Philadelphia, Boston, St. Louis, Cleveland, Cincinnati, Pittsburgh, Detroit, Kansas City, Minneapolis, Nashville, Birmingham, Salt Lake City, Seattle, Peoria

THE BARRETT COMPANY, LIMITED: Montreal, Toronto, Winnipeg, Vancouver, St. John, N. B., Halifax, N. S., Sydney, N. S.

Apollo Roofing Products

Full weight—Galvanized

Metal makes the most satisfactory roofing for farm buildings or city construction.

APOLLO-KEYSTONE Copper Steel Galvanized Sheets are unexcelled for Culverts, Tanks, Silos Roofing, Spouting and all exposed sheet metal work. Look for the Keystone added to brand. Sold by leading dealers. KEYSTONE COPPER STEEL is also superior for Roofing Tin Plates. Send for "Better Buildings" booklet.

AMERICAN SHEET AND TIN PLATE COMPANY, Pittsburgh, Pa.

When Writing to Advertisers, Mention Hoard's Dairyman

Both herds are in good condition and show good promise of developing on the circuit into strong competition at the later exhibitions. The weakness of the Seitz herd in the lack of a high class aged cow, due to the death of four different animals on which plans were laid, one dying two weeks before the circuit began and one, the last one fitted, overeating and dying at Sedalia.

Cavalier's Lord Roseberry and Cavalier's Lord Stuart led the males, finding their strongest competition between themselves, as it is prophesied they will throughout the circuit. Judge Oosterhuis favored the younger bull, Cavalier's Lord Stuart, for grand championship. The greater scale and development, superior lines about the rump, and thinner, cleaner thighs of the older animal would influence many to reverse the decisions. However, it is agreed that the bull which beats either of them this year will need to be a good one. The Seitz senior calf, Cavalier's Netherall Chancelor, was selected to top the juniors.

Van Etta showed Mayflower of Rock Ridge Farm among the aged cows and won first. This cow is a splendid dairy type and is an unusually "milky" animal. The Seitz herd was successful again in capturing first in the younger female classes and was awarded the championships. Cavalier's Kilnford Dorothy, a two-year-old, was made senior and grand and Cavalier's Kilnford Lily was selected to lead the "under twos".

The list of awards follows:

Bull 3 years or over—1, Seitz on Cavalier's Lord Roseberry; 2, Van Etta on Bargenoch Rising Star. Bull 2 years and under 3—1, Seitz on Cavalier's Lord Stuart. Bull 1 year and under 2—1, Seitz on Cavalier's Goldfinder; 2, Van Etta on Madison of Cloverdale. Bull calf 6 mos. and under 12—1, Seitz on Cavalier's Netherhall Chancelor; 2 and 3, Van Etta on Cloverdale's First Choice and Cloverdale's Choice Goods. Bull calf under 6 mos.—1, Seitz on Cavalier's Rising Surprise.

Cow 5 years or over—1 and 3, Van Etta on Mayflower of Rock Ridge Farm and Cavalier's Violet; 2, Seitz on Bargenoch's Silver Pet. Cow 4 years and under 5—1, Seitz on Willowmoor White Lola 4th; 2, Van Etta on Favorite. Cow 3 years and under 4—1, Seitz on Cavalier's Lady Mary Stuart; 2, Van Etta on Aldebaron Rosemary. Heifer 2 years and under 3—1 and 3, Seitz on Cavalier's Kilnford Dorothy and Cavalier's Lady Bountiful; 2, 4, and 5, Van Etta on Cloverdale's Lady Bountiful; Cavalier's Flukie, and Beatrice Douglas of Orchard Home. Heifer not in milk, 1 year and under 2—1, 2, 4, 5, Seitz on Cavalier's Kilnford Lily, Cavalier's Kilnford Bell 3rd, Silver Dream, Cavalier's Lady Bountiful; 3, Van Etta on Beauty of Cloverdale. Heifer in milk 18 mos. and under 24—1, Van Etta. Heifer calf 6 mos. and under 12—1, 2, 3, Seitz on Cavalier's Rosebud, Cavalier's Buntie Bell, and Cavalier's Queen; 4 and 5, Van Etta on Jane of Cloverdale and Cloverdale's Confidence. Heifer calf under 6 mos.—1, 3, and 5, Seitz on Cavalier's Silver Actress, Cavalier's Lady Betty, and Cavalier's Lilian Walker; 2 and 4, Van Etta on Cloverdale's Fashion Plate and Cloverdale Bit of Fashion.

Dairy Herd—Van Etta. Exhibitor's Herd—1, Seitz; 2, Van Etta. Breeder's Young Herd—1, Seitz; 2, Van Etta. Calf Herd—1, Seitz; 2, Van Etta. Get of Sire—1, Seitz; 2, Van Etta. Produce of Cow—1, Seitz; 2, Van Etta.

Champion and Grand Champion Bull—Cavalier's Lord Stuart. Junior Champion Bull—Cavalier's Netherall Chancelor.

Champion and Grand Champion Cow—Cavalier's Kilnford Dorothy. Junior Champion Cow—Cavalier's Kilnford Lily.

Premier Champion Breeder—Seitz.

Guernseys

Exhibitors: John, Ebels, Michigan; Goodhand Kingston and Son, Wisconsin; O. W. Lehman, Illinois.

Judge: L. S. Gillette.

Three herds from as many states made up the Guernsey show, the forty-one animals led out constituting a larger exhibit than Illinois usually draws. Two herds were of good quality and were fitted for exhibition. They divided the money evenly and were well worthy of the awards given them. The Michigan herd, however, materially detracted from the appearance of the classes. They were in lower flesh than is ever profitable with breeding animals and were badly prepared for showing. In several classes, the individuality of the exhibits would have improved their ranking; in one case would have brought a blue ribbon, if the vitality and appearance of the animals had not been injured through poor caretaking.

Lehman's aged bull, Pinecrest King France, led the mature sires but found strong competition in the championships from Hopeful of Edgemoor, Kingston and Son's two-year-old, junior champion at the last National. He is an improvement over the older bull in rump, clean cut thighs, and in lines and gives promise of growing into a spendid bull. Just now he shows his Columbus fault of being a bit off the ground and not well filled down in the middle too plainly to entitle him to place over the Lehman bull made grand champion by Judge Gillette. Kingston and Son received the purple in the junior males on Trestan's Golden Glory. The bull classes were quite well filled and were of much better average quality than were those for females.

Imp. Princess Du Braye 2nd, owned by Kingston and Son, was placed at the head of the aged cows. She did not have the lines or the showy appearance of Rag Apple from the Illinois herd, a cow shown dry, but was favored by the judge because of her freedom from excessive fleshing and because of her milkiness.

The next good one was Raymond's Princess from the three-year-olds, owned by Lehman. She is plain headed but has a nicely developed middle and udder besides being well lined. She was the best the exhibit offered and was made grand champion. A bright, sturdy senior calf from the Wisconsin herd was made champion of the juniors.

Bull 3 years or over—1, Lehman on Pinecrest King France; 2, Goodhand Kingston & Son on Moss Raider of Muskego; 3, Ebels on L'Aiglon of Bon Ayre. Bull 2 years and under 3—1, Kingston & Son on Hopeful of Edgemoor. Bull 1 year and under 2—1, Lehman; 2, Hyzer on Beauty Eagles Emperor of Riverdale; 3, Ebels on Olive King Duke. Bull calf 6 mos. and under 12—1 and 3, Kingston & Son on King Elder Lawn and Muskego Princeling; 2 and 4, Ebels on Olive Red Rose and Olive Don. Bull calf under 6 mos.—1 and 3, Kingston on Muskego Stars and Stripes and Muskego Moss Raider; 2, Lehman on King of Chesney Farms; 4, Ebels on Don of Olive.

Cow 5 years or over—1, Kingston on Imp. Princess Du Braye 2nd; 2, Lehman on Rag Apple; 3 and 4, Ebels on Nancy of Lyndon Heights 2nd and Imp. Lizette III of the Hall. Cow 4 years and under 5—1, Lehman on Gold Speck; 2, Ebels on Lizette of Butternut Hill. Cow 3 years and under 4—1, Lehman on Raymond's Princess; 2, Kingston on Chywoone Lassie of Muskego L. Heifer 2 years and under 3—1, Kingston on Trislete Ave of Sunny Slope; 2, Ebels on Nancy of Butternut Hill; 3, Lehman on Lilly Bell of Chesney Farms.

Heifer not in milk, 1 year and under 2—1 and 2, Kingston on Queen of Waukesha Stock Farm and Radier's Minnie of Muskego; 3 and 4, Lehman on Speck of Chesney Farms and Lilla of Chesney Farms; 5, Ebels on Nettie of Butternut Hill. Heifer calf 6 mos. and under 12—1 and 4, Kingston on Trestan's Golden Glory and Muskego Hope; 2 and 5, Lehman on French Maid of Chesney Farms and Top Maid of Chesney Farms; 4, Ebels on Muriel of Bon Ayre. Heifer calf under 6 mos.—1 and 2, Lehman on Faith Maid of Chesney Farms and Pride Maid of Chesney Farms; 3 and 4, Ebels on Lona of Hazel Bank and Princess of Olive.

Dairy Herd—1, Lehman; 2, Ebels. Exhibitor's Herd—1, Kingston & Son; 2, Lehman; 3, Ebels. Breeders' Young Herd—1, Kingston; 2, Lehman, 3, Ebels. Calf Herd—1, Lehman; 2. Ebels. Get of Sire—1, Ebels; 2, Lehman; 3, Kingston. Produce of Cow—1, Kingston; 2 and 3, Ebels.

Champion and Grand Champion bull—Pinecrest King France. Junior Champion bull—Hopeful of Edgemoor.

Champion and Grand Champion cow—Raymond's Princess. Junior Champion cow—Trestan's Golden Glory.

Jerseys

Exhibitors: W. S. O'Hair and Sons, J. K. Dering, and W. A. Brewerton, all of Illinois, and Myrtle E. and Earl F. Pyle, Ohio.

Judge: L. S. Gillette.

Jerseys more than maintained the standard of previous exhibits, both in quality and numerically. No outstanding individuals were found but, of even greater significance than the

presence of a few extra good ones, no unworthy animals were led in. The younger classes especially were well filled with first class animals. The breed is not strongly established in Illinois but interest is said to be increasing steadily in the little fawn cow, particularly in "Egypt" and other parts of the south end of the state. A number of beginning breeders about the ringside gave a good bit of attention to the pedigrees of the animals shown and were gratified that a goodly number had records back of them. Many of the new adherents of the breed have started their herds by using production bred sires.

Four breeders brought out a total of 67 head. Winnings were fairly well divided, a championship going to each herd.

Judge Gillette found a blue ribbon bull among the aged sires in Rosebud's Champion Lad, owned by W. S. O'Hair and Sons, preferring him to W. A. Brewerton's Raleigh's Acland, a three-year-old with the carriage and growth of a winner but lacking the depth and fullness another year or two will give him. The Pyle entry was badly handicapped by lack of scale, and was placed third.

The senior and grand champion bull was the two-year-old, Sans Aloi's Niece's King, owned by M. E. and E. F. Pyle. He was a showier, cleaner cut bull than his aged competitor and found favor with onlookers. Peter the Great, owned by W. A. Brewerton, was well qualified for the junior championship awarded him.

Manser's April Flower was an easy leader for the W. A. Brewerton herd among the aged cows. She had freshened lately and was milking heavily which brought her into the ring a bit thin. She lost later in the awards to Hattie's Rosebud Queen, from the O'Hair exhibit, which was then made grand champion over Dering's yearling heifer, Eagle's Chief's Eulinda, an entry of type and vigorous but being a bit too heavily fleshed to be pleasing to the judge. Hattie's Rosebud Queen was a deeper, stronger cow than the aged winner and had the distinction of a noticeable resemblance to the famous long distance Jersey champion, Sophie 19th of Hood Farm.

The list of awards follows:

Bull 3 years or over—1, O'Hair & Sons on Rosebud's Champion Lad; 2, Brewerton on Raleigh's Acland; 3, Pyle on Angelica's King. Bull 2 years and under 3—1, Pyle on Sans Aloi's Niece's King; 2, O'Hair on Sophia 19th's Tormentor 5th. Bull 1 year and under 2—1 and 4, Pyle on Financial Richmond and Rosa Sans Aloi K; 2 and 5, Brewerton on Jap's Interested Boy and Legacy's Jolly; 3, Dering on Rose's Big Chief. Bull calf 6 mos. and under 12—1, 3, and 5, Brewerton on Peter the Great, Virginia Fox Sultan, and Rubaiyat Raleigh; 2, Pyle on King's Rosa's Sans Aloi's E.; 4, O'Hair on Sophie's Rosebud's Tormentor. Bull calf under 6 mos.—1 and 4, Pyle on Stockwell's Niece's King and Martell's Sans Aloi; 2 and 3, O'Hair on Sophie's Domino Tormentor; and 5, Dering on Cedar Crest's Jolly Tar.

Cow 5 years or over—1, 3, and 4, Brewerton on Manser's April Flower, Pennithorpe's Lass and Elinor Pennithorpe; 2, Pyle on Sultan's Eminence; 5, Dering on Yolande's Fairy. Cow 4 years and under 5—1, O'Hair on Hattie's Rosebud Queen. Cow 3 years and under 4—1, Dering on Fairy Boy's Violette; 2 and 3, Pyle on King's Columbine F. and Financial Mary K.; 4, Brewerton on Thornbury Pennithorpe. Heifer 2 years and under 3—1 and 4, Pyle on Financial Maria P. and Rochette's Jolly Sultana; 2, O'Hara on Guenon's Fern Rosebud; 3, Dering on Eagle Chief's Fairy; 5, Brewerton on Cowslip's Gentle Sultana. Heifer not in milk, 1 year old and under 2—1, 2, and 3, Dering on Eagle's Chief's Eulinda, Eagle's Christina, and Eagle's Yolande Girl; 4, Brewerton on Etta Brookhill; 5, Pyle on Lady Silver You'll Do. Heifer 6 mos. old and under 12—1 and 2, Dering on Blue Bell of Cedar Crest and Eulinda of Cedar Crest; 3, Brewerton on Thornbury's April Flower; 4 and 5, O'Hair on Rosebud's Ellen and Tormentor's Star Sophie. Heifer calf under 6 mos.—1 and 5, Dering on Fairy Boy's Crown and Venner's Fairy Maid; 2, Brewerton on Puggy Thornbury; 3, Pyle on Sans Aloi's Golden Diploma; 4, O'Hair on Golden's Rosebud's Beauty.

Dairy Herd—1, Brewerton; 2, Pyle; 3, Dering. Exhibitor's Herd—1 and 4, Pyle; 2, O'Hair; 3, Brewerton. Breeder's Young Herd—1, Dering; 2, O'Hair; 3, Pyle. Calf Herd—1, Dering; 2, Brewerton; 3, O'Hair; 4, Pyle. Get of Sire—1 and 2, Dering; 3 and 5, Pyle; 4, O'Hair. Produce of Cow—1 and 3, O'Hair; 2 and 5, Dering; 4, Brewerton.

Senior and Grand Champion bull—Sans Aloi's Niece's King. Junior Champion bull—Peter the Great.

Senior and Grand Champion Cow—Hattie's Rosebud Queen. Junior Champion Cow—Eagle's Chief's Eulinda.

Valuable Exhibit at Dairy Cattle Congress

"The day may yet come when the child life of the world will be in the hands of the dairymen of America. He is a part of the world's reserve army that may, at any moment, be called into battle for our existence and the existence of the next generation." This is a statement recently made by Herbert Hoover, the man chosen to guide the food supply of the nation during the war.

Mr. Hoover further stated that "the dairy industry must not only be maintained but that the production of milk, butter, and cheese must be increased". In following out the food conservation campaign so admirably planned, we are asked to conserve principally wheat and meat. These two items are selected because they are staple foods that are easily transported. Milk and other dairy products are the best and cheapest substitutes for meat and therefore their increased consumption is encouraged.

From Europe comes the report that more than three-fifths of the dairy cattle have been slaughtered. The extreme shortage of milk was one of the first problems to receive the attention of the Red Cross Relief Commission when it entered Belgium and Northern France after these unfortunate countries were invaded by the Hun.

There has been scarcely a child born in the north of France and many in Belgium, whose continued life has not been dependent during the past four years upon American condensed milk. For this purpose condensed milk has been shipped not in single cans but in scores of thousands of tons. Every American would be thrilled could he but see the gratitude which French mothers daily express over the pitiable ration which enables their children to survive.

European conditions are not the only reason why the dairy industry must be fostered. Dr. McCollum, one of the greatest American scientists, has proven conclusively that milk contains a certain life giving element essential to normal human development and that this essential is not contained in any other food except in limited amounts in the leaves of plants.

It has been found that children denied milk, no matter what their ration might be, become weak and puny; that after a few weeks they develop skin diseases and in many instances become blind. It is for this reason that every mother should fully understand and appreciate the value of milk to not only the infant, but to the growing child as well.

These facts and many more will be embodied in a mammoth exhibit to be made at the Dairy Cattle Congress and Industrial Exposition to be held at Waterloo, Iowa, September 30th to October 6th. It is an exhibit that will be of vital interest to every one whether they live in town or the country. It will be a complete new feature in addition to the many other attractions of this great national exposition which has been the center of attraction for the dairy world during the past eight years.—PUBLICITY DEPARTMENT.

"Either the civilian must go short of many things to which he is accustomed in times of peace, or our armies must go short munitions and other things indispensable to them."
—LORD KITCHENER.

A little thing that means a lot to you

Drilling a little hole in the top of the Sharples tubular bowl revolutionized the mechanical separation of milk, saving millions of pounds of butterfat yearly for dairymen.

This Suction-feed principle is an exclusive patented feature; it "drinks" the milk only in proportion as it can be perfectly separated.

Through the fixed-feed separator being turned under speed there is a cream loss averaging ten pounds of butter *per cow* yearly and tests show that 95% of all separators are turned under speed most of the time. Sharples *skims clean at any speed.*

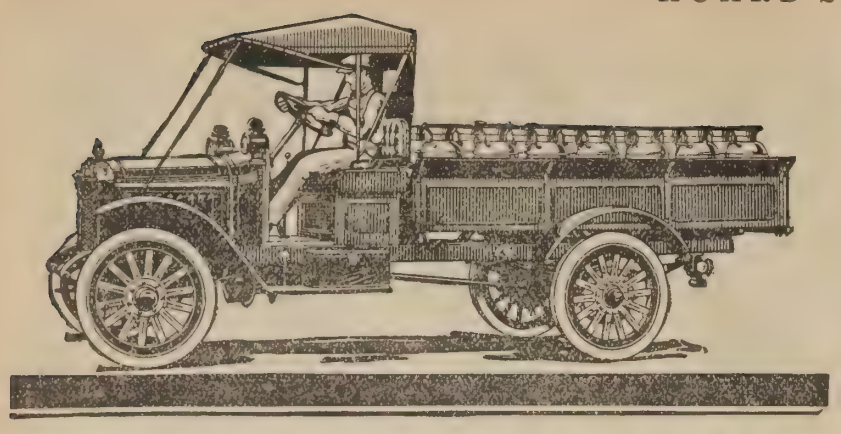
SHARPLES
SUCTION-FEED CREAM SEPARATOR

Due to its tubular shape, the Sharples bowl has double the centrifugal force (the skimming force), so requires no troublesome discs or other contraptions to effect complete separation.

Whether you turn fast or slow, the Sharples Suction-feed is just as faithful in clean skimming.

It is easy to turn a Sharples fast to get through quicker, as the light tubular bowl is suspended from a frictionless ball bearing, running in oil. Your cream remains at the same thickness, regardless of speed.

It is your duty to yourself and to the country to use every precaution for saving butterfat—to yourself, because prices are at their highest; to your country because fats are "victory munitions".



Know all about the Sharples—write for catalog today to nearest office, addressing Dept. 10.

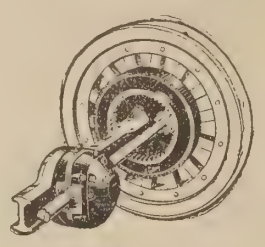
REPUBLIC TRUCKS
make dairying more profitable

Dairymen have found that a Republic Truck is not only a convenience but a money maker.

A Republic hauls the milk and cream to market in a fraction of the time required to haul it by wagon and keeps the horses at work on the farm where they are needed.

Republic Trucks meet every requirement of the dairy farmer. Country roads, deep mud, steep hills, only serve to show the power and dependability of these rugged trucks.



The Internal Gear Drive gains a tremendous leverage by applying the power nearer the rim of the wheel. It makes possible the use of a separate I-beam axle of solid forged steel, giving 45% greater road clearance. Unsprung weight is greatly reduced, saving tires, gasoline and upkeep expense. Republics are easy-riding, too, and easy to drive and care for.

Republic Trucks have given such remarkable service to their owners that it has been necessary to build more than twice as many of them as any other make in order to supply the demand.

There are more than 1300 Republic Service Stations, distributed all over the United States.

Seven models—¾ ton to 5 ton

See the nearest Republic dealer and write us for latest booklet.

More Power

The Internal Gear Drive used on all Republic Trucks delivers 92% of the motor power to the wheels. We know of no other drive that delivers as much

Drain Before Winter Rains

Get ready for ditching and terracing your farm NOW. Don't delay. Water standing on your land during the winter will smother the soil, kills big crop chances for next year. You can solve the open ditch or tile ditch problem **at low cost.** You can make sure that your land will be in finest condition for early spring work. Seed will germinate much quicker and be healthier n well-drained soil. Write for new book that tells how to do it with

THE Martin O.D.&G.CO. REGISTERED **FARM DITCHER Terracer & Grader**

Model 20

All-steel, reversible, lasts a lifetime. Cuts V-shaped farm ditch, open drain, tile or irrigation, down to 4 ft. deep; cleans old ditches; grades roads; builds farm terraces, dikes and levees; works in any soil, wet or dry. 2, 4 and 6 horse sizes; large size fine for tractor. Does work of 100 men. Solves all dirt-moving problems. Write and find out how to make big crops sure. New, free book on drainage, irrigation and terracing. Address

Association Notes

Meadville, Pa.:—One member purchased his first pure-breds this month, a two-year-old heifer and a well-bred heifer calf. In July market milk sold for $2.25 per hundred pounds. The average test required was 3.5 per cent and for each pound above, 5 cents were paid. Milk retails for 12 cents per quart, butter for 45 cents per pound, and cheese for 40 cents per pound. The following are the local prices of feed: Pasturage, $1.50; oil meal, $63.00 per ton; cottonseed meal, $60.00; and bran, $35.00 to $48.00. The feed dealers in some places are not keeping a variety of good feeds in stock which makes it hard for our members to feed balanced rations.

Sheboygan Falls, Wis.:—Four poor cows were sold during the month and many more poor ones will be culled out as the pasture is too short and feed too high priced to keep them. The farmers receive from $2.00 to $2.08 per hundred pounds for milk while those selling to a cheese factory receive from 60 to 64 cents per pound fat. The local prices for feed are: Corn silage, $6.00 per ton; hay, $20.00; oats, $25.00; Arcadia feed, $48.00; oil meal, $60.00; Victor feed, $54.00; bran, $41.00; and corn, $1.55 per bushel.

Wisconsin Association

The summary of July reports for Wisconsin Associations gives records for 44 out of the 110 or more associations in that state. The number of 40-lb. cows ranged from as low as one up to 113 for the New Holstein Association. The high cow for the state is a grade Guernsey owned by L. McIlrath of the Chilton Association. This cow produced 84 lbs. of fat during the month of July. The high herd for the month consisted of 14 grade Holsteins owned by William Rann of the Medford Association. These cows averaged 1,578 lbs. milk containing 62.8 pounds fat.

The following are selected quotations from reports of a few of the testers for the various associations:

Barneveld: We have 27 members, 15 of whom are using milking machines. Feeding is the greatest question here and am getting them interested in feeding during the summer on pasture.

Burnett Co.: We have purchased a whitewashing machine and the tester does most of the work. Also bought a barrel of fly dope that proved quite popular at 65c a gallon. The C. T. A. picnic was held July 26th at Wood Lake and was pronounced a success.

Chilton: Four registered cows added to the list. Sixteen members now own milking machines.

Cross Plains: Most members are feeding grain with pasture. One member installed a milking machine.

Dodge County: One of our members bought a pure-bred bull. Some of them are talking about building more silos so they can feed silage in the summer when pasture is down, thus keeping up the flow of milk.

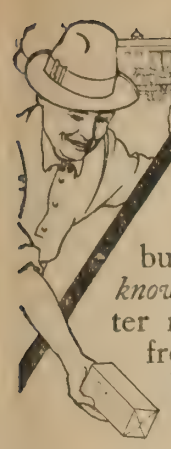
Dodgeville: One separator found that was losing about 50c per day in a herd of ten cows. Ten farmers feeding grain on pasture.

Dunn Co. No. 1: Six cows sold as unprofitable. One separator found skimming unsatisfactory. Eleven cows were killed by lightning in one tested herd.

Geneva: Carload of bran bought. The farmers that are feeding grain are the ones that seem to be making the most success.

Mondovi: Found two separators that were not skimming clean. Our association is being reorganized and the prospects look good for it to continue. Highest cow for year made 452 lbs. butterfat.

New Holstein—Kiel: Twenty-two of the 27 members in this association are weighing the milk daily. Many of the members are feeding grain or silage in the barn owing to the short pasture, heat, and flies, which are quite bad at this time and yet the cows have gone down considerably in milk flow. Nevertheless, 113 cows produced 40 lbs. or more of fat out of 424 on test and 27 cows made more than 50 lbs.



Rice and Cedar Lake: Fourteen low producers have been sold and will be replaced with better ones. One poor separator has been found and one milking machine installed.

Spring Green: Have sent for carload feed, also two carloads lime stone.

Barneveld: When I am ready to fill the bottles I place the bath tank filled with hot water on the tester or other convenient object and using a small rubber tube (such as may be purchased at the drug store), siphon the water into the bottles while in the tester. The same method is handy for washing bottles as the water is forced into them and I avoid getting acid in the bath tank. A small part of a broken pipette inserted in the discharge end of the tube together with pressing or kinking the tube will regulate the water flow.

Illinois Association

Lake County No. 2: During the month of July 451 cows were on test. Five unprofitable cows were sold and thirteen pure-breds were purchased. During the past four months more than forty pure-breds have been purchased. The honor of having the highest producing and most profitable cow in the association goes to Rouse Bros., their 4-year-old pure-bred

Does Mrs. Housewife Demand Your Butter?

She is the judge of butter value. *She knows* sweet, clean butter must be protected from dirt, dust and bad odors.

And *she is only too glad* to pay extra for good butter wrapped or covered with

Paterson Pioneer Parchment Paper

It is *worth* more. Your brand stamped on it stands for *quality*. She learns to demand it by name. *You profit.*

Made in rolls, sheets and circles, to suit all methods of marketing.

Build Or Remodel For More Profits

James planned and equipped dairy barns mean more milk and less work. Make your dairy barn an efficient work shop and profit maker. Install

JAMES
Sanitary Barn Equipment

Give your herd contentment and comfort and they'll give you more milk. James equipment is the practical profit-maker that thousands of America's dairymen use. Tell us when you intend to build or remodel and for how many cows— we will send you the big "Jamesway" Book Free.

James Manufacturing Co.
23 Cane Street, Ft. Atkinson, Wis. Elmira, N. Y.

Holstein cow producing 1,984 lbs. of milk containing 83.32 lbs. fat.

Highland—St. Jacob: Two hundred and twenty-four cows were tested during July. Five cows produced over 40 lbs. of butterfat. Fred Hollard had the high herd average for the month. A pure-bred Holstein cow owned by Emil Fricker was the high cow in the association. She produced 1,231 lbs. milk containing 49.24 lbs. fat.

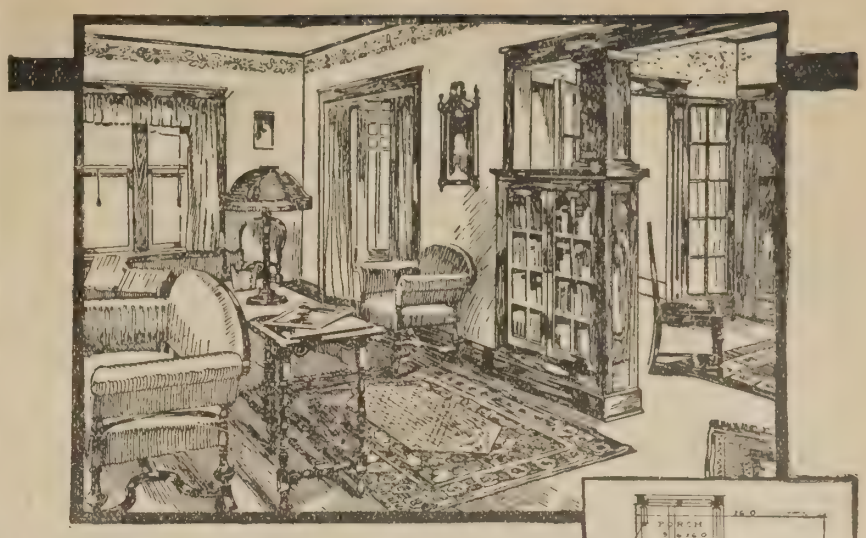
Jacksonville—Springfield: Twenty-six cows produced more than 40 lbs. of fat. Five hundred and eighty-one cows tested. There are nine milking machines in the association and all are proving their worth at the present time with a shortage of labor.

Rockford: Ray Pfeil's herd of Holsteins produced an average of 31.4 lbs. of butterfat. Frank Davis owned the high cow, a grade Jersey. She produced 943 lbs. of milk and 50 lbs. of butterfat.

Jo Davies Co.: Mr. M. Y. Graham of E. Dubuque again has the high cow for the month. She produced 1,872 lbs. milk containing 69.2 lbs. fat. Her feed cost was $12.35 and she returned a profit of $23.21. She was fed a grain mixture of oil meal, bran, ground oats, and ground corn.

First Lake Co.: F. K. Kennedy has high profit cow; profit over feed,

Professor H. H. Kildee, who for the past two years has been head of the Dairy Department of the Minnesota College of Agriculture, has now taken up his duties as head of the Animal Husbandry Department of the Iowa State College.



$25.98. Alex Hughes has high herd; Milk, 813 lbs.; fat, 27.6 lbs. Four hundred and sixteen cows were on test during the month.

McHenry—Nunda: Twenty-one cows produced more than 40 lbs. of butterfat during July. The herd of Mr. M. B. Weaver averaged for July 28.7 lbs. of milk per day. Wingate and Hale are second with 24.1 pounds of milk per cow. Steve H. Freund has high butterfat cow for the month, 63.7 lbs.

Boone Co. No. 1: One Durham bull was replaced by a pure-bred Holstein. High herd for the month was owned by J. Herbert. F. William Blake had the high cow for the month, a 2-year-old heifer producing 1,230 lbs. milk containing 46.74 lbs. butterfat. At a meeting held July 20 the members decided to purchase 10 carloads of No. 1 alfalfa.

The War Trade Board last month issued orders forbidding the importation of flaxseed from Argentine and in addition has permitted the exportation of linseed oil cake or meal to Canada. It is perhaps too early to know what effect this will have on the oil meal market, but it would indicate that higher prices will prevail this winter unless the domestic production of flaxseed exceeds the anticipated supply.

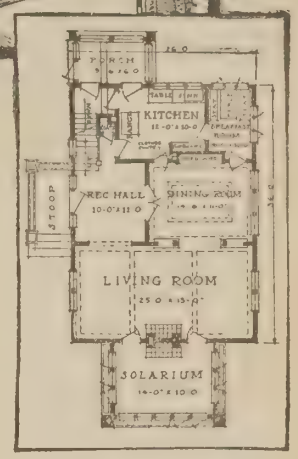
Eat thou honey because it is good. Proverbs XXIV—13.

Unless it bears this mark—CURTIS it is not CURTIS Woodwork

AFTER a piece of our woodwork has passed close inspection of both material and workmanship, it is stamped plainly with this mark—CURTIS. Every piece is so marked.

This mark serves a double purpose. It is the connecting link between the pictures of CURTIS Woodwork shown in our plan books and catalogs and the actual woodwork that goes into your home. It is our guarantee to you that each piece is of Curtis design, material and workmanship.

1866 CURTIS WOODWORK
"The Permanent Furniture for Your Home"



Vital as the furnishing of good woodwork is to the convenience and comfort of your home, there are other ways in which we and your lumber dealer can help you.

If you want a new home we can help you from the very beginning of your plans.

If you remodel your present home you can select designs that suit your taste or need, from the dealer's stock or from his big Curtis Catalog.

For the utmost in prompt service, in quality of design, material and workmanship, we recommend standard sizes and designs.

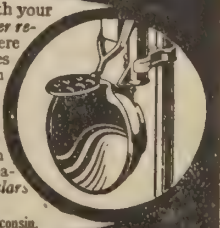
These books each contain floor plans, exterior and interior views of thirty well-planned homes finished with CURTIS Woodwork. They teem with ideas for prospective home builders. "Better Built Homes," Vol. II, range lower than $3,150. More expensive homes are shown in Vol. III. Tell us which book you want.

20 to 25% Bigger Winter Milk Yields



WITH pure, rich milk analyzing 87% water—and with your winter herd *getting only ¼ to ⅓ of their natural water requirement from icy outdoor tanks*, you can see where cold weather cow-thirst is one of the biggest causes of your year-after-year winter milk shortages. With

Simplex Improved Water Bowls

your cows drink "to their hearts' content" day and night. Result—*20 to 25% more milk from every cow all through the housed-in season.* And no more frozen tanks—no tank-heater makeshifts—no more twice-a-day "herding out" periods. *Write for Full Particulars on the Only Drop-Down Water Bowl on the Market.*

F. Rassmann Manufacturing Co., 31 Mill Street, Beaver Dam, Wisconsin.

The Only "Drop Clean" Water Bowl Made

ORDER YOUR FALL AND WINTER FEED SUPPLY NOW

Don't run the risk of a possible feed shortage next winter due to shipping difficulties—be on the safe side—order your feed NOW and be sure that you order feeds that meet your requirements best. Actual feeding results and low cost make it decidedly to your advantage to stock up on the "old reliable"

SCHUMACHER FEED AND BIG "Q" DAIRY RATION

SCHUMACHER FEED has time and time again proved its merit in record making, record breaking long distance milk and butter production tests—it has to its credit (fed with high protein concentrates) more World's Champion Milk and Butter Records than all other feeds combined. SCHUMACHER FEED is a grain ration that supplies ENERGY — STRENGTH — STAMINA and ENDURANCE that cows must possess if they are to be big producers. SCHUMACHER FEED is also an ideal feed for dry cows, horses, hogs and growing stock.

15 Cents Apiece for Jute Sacks
Your dealer will pay you 15 cents apiece for empty jute sacks of our brands returned to him in good condition.

BIG "Q" DAIRY RATION is a protein ration of the highest quality made on the modern idea of "highest quality" of protein content—a wonderful milk producer.

By having a liberal stock of SCHUMACHER FEED and BIG "Q" DAIRY RATION you will be independent of a feed shortage and be assured of best results from all your stock because SCHUMACHER FEED and BIG "Q" are splendid result-producing feeds.

Also as a price consideration it is to your advantage to stock up on these feeds. Our liberal allowance of 15c each for jute sacks of our brands makes SCHUMACHER FEED $20 to $25 per ton cheaper than good corn and many dollars per ton cheaper than hominy feeds.

Don't delay — order NOW. Your dealer can supply you NOW — he may not be able to later. "A WORD TO THE WISE IS SUFFICIENT."

B. C. Dairy News

HOARD'S DAIRYMAN:—Municipal authorities in Vancouver are trying to bring about an amalgamation of the milk distributors, as a counter to conditions which are boosting the price of milk. In an investigation made a year ago the city authorities found that an estimated $75,000 to $100,000 a year was lost in milk distribution owing to duplication in equipment and labor. When in early August the Fraser Valley Milk Producers' Association, the farmers' organization which wholesales 90 per cent of the milk entering Vancouver, announced a ten per cent increase in price, and the dealers followed with a statement that they must get 14c instead of 12½, Mayor R. H. Gale and his council got into action. The newly-forgotten findings of the 1917 investigation were recalled, and a conference to consider amalgamation quickly convened at City Hall.

To Combine Milk Distributors

The producers were the first to point out the great economic loss in the milk distributing system of Vancouver, and would welcome formation of one distributing concern. In fact, they have even considered attempting the work themselves. There does not, however, appear to be especially good prospects of success in the present agitation. The three largest concerns, it developed at the conference, would join a merger, but many of the smaller dealers, who, in frequent cases, work on their own outfits, are chary of the deal. They do not care to put their capital in a concern in which they would have little control. Some would be glad to sell out. A committee of dealers, producers, and civic officials is at present working out a plan of amalgamation.

The city hall meeting was an interesting commentary on changes recent years have wrought. It is something new for a community to lend all possible assistance to the formation of a monopoly. It is refreshingly novel for producers to be the strongest party at a conference of milk farmers, middlemen, and consumers. It is almost startling for middlemen to defend loyally, as they did at this Vancouver meeting, an arbitrary price advance by producers. Mayor Gale of Vancouver is outspoken in his opposition to the producers, declaring they now have a price-dominating organization, but he gets no sympathy from the dealers, who say the wonder is the farmers' price is not higher.

On the production side this has been an unfavorable season in Southern British Columbia, as it has in most parts of Western Canada. The hay crop has been estimated at 70% of normal. Fraser Valley farmers handle deep alluvial soils and only rarely does drought seriously reduce yields. They usually ship out large quantities of baled hay. The shortage in the present crop, however, is so apparent, that the first hay sold in the field brought $35 a ton, and so many farmers are endeavoring to reduce their herds that there has been a precipitate drop in dairy cattle prices. Oats command $65 a ton and there is a serious shortage of mill feeds.

Hay Crop Short

It is possible, of course, that the hay shortage is over-calculated. Hon. E. D. Barrow, minister of agriculture, is now on a trip which will take him through the principal hay-producing sections of both dry and wet belts, with the special purpose of ascertaining the true situation.

Chinese and Hindus have been depended on largely in the hay harvest.

They have commanded unprecedented wages—$4.75 a day with one meal furnished, or $5 straight. Women and girls have worked in the field on many farms.

Community Breeding

Kelowna, in the dry Okanagan Valley, is the first British Columbia district to start community breeding. Dairymen there picked the breed already the favorite, the Holstein. Arrangements have been made for a first importation of young foundation stock. The local co-operative creamery has loaned $500 to the breeders' association, stipulating it shall be used for the purchase of a pure-bred bull.

This interior locality, formerly devoted entirely to fruit and vegetables, has only been on the British Columbia dairying map about three years. The local market for whole milk was small, and there was no creamery within shipping distance, but the farmers had courage. They built a creamery and started out to produce enough cream to make it profitable. The venture has been very successful. The production during the last business year was about 100,000 lbs., a substantial increase over the preceding year. The creamery is now receiving cream from all parts of the Okanagan Valley, paying 48 cents for butterfat, f. o. b. The dairy farmers are prospering, and silos are being built faster than in any other B. C. district.

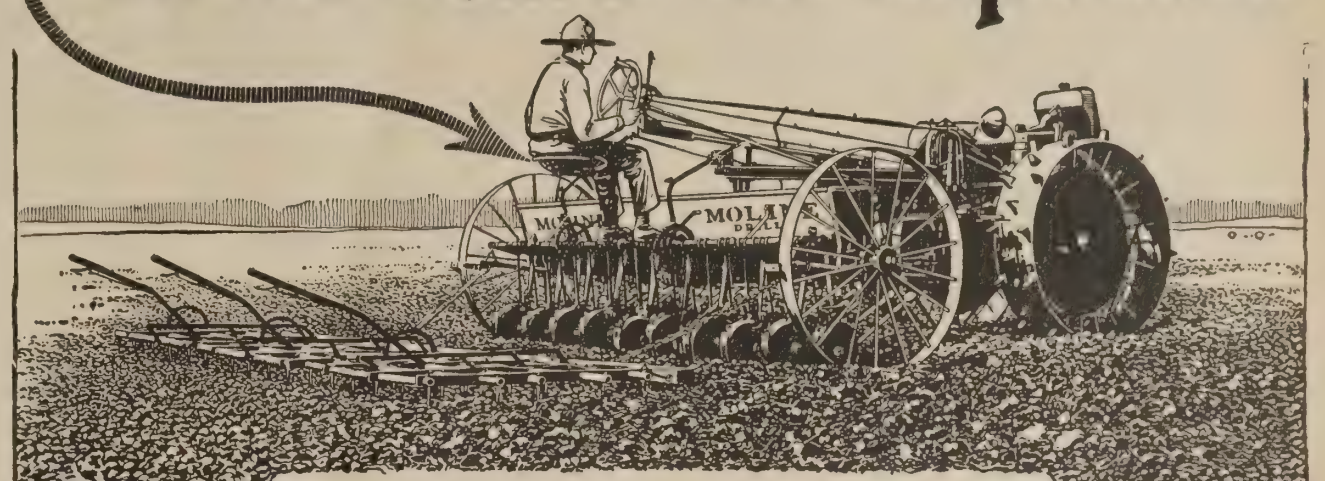
Kelwona held a dairymen's picnic in June at which the community breeding plan took form. Professor J. A. McLean of the University of British Columbia was a leading spirit in the project. He gave a lecture on dairy cattle type at the picnic, demonstrating with good stock from local farms. Other experts lectured on pertinent subjects, and there was a tractor demonstration.

JOHN PAWTUCKAWAY.

Babies at the Dairy Show

How and why milk and butterfat are essential to the growth of babies and young children, will be shown in the most graphic way at the National Dairy Show, Columbus, Ohio, October 10th to 19th.

One entire building will be devoted to the interest which mothers have in the use of dairy products.



A large enclosure will be provided for a well babies' clinic to be held, and the co-operation of the Children's Bureau of the U. S. Department of Labor; state, local, as well as National Children's Welfare Workers are being enlisted in this great movement that is designed to emphasize the importance of keeping children growing by supplying them all that they need.

Science has shown that growing children not only require the usual proteins and carbohydrate foods, but that proper mineral matters must be supplied, that their bones may grow, and that they must have that unknown protective something which is secured only in the mother's breast milk or in the milk of man's foster mother—the dairy cow.

In addition to the portion of the building devoted to the children and their examination, a section will be devoted to the home preparation of milk for infant feeding.

The part which the visiting nurses' associations, day nurseries, milk stations, mothers' clubs, parent teachers' associations, summer camps, and infant hygiene divisions of our state and city boards of health will take will be in a campaign for healthier children to take the place of the flower of our youth who have gone abroad, and will be a wonderfully interesting feature at the next dairy show. —NATIONAL DAIRY SHOW.

You Sit Where You Always Sat On the Seat of the Implement

MOLINE UNIVERSAL TRACTOR

It Solves The Farm Help Problem

YOU wouldn't think of riding on the back of one of your horses while at work in order to guide your team. If you did you would require another person to operate the implement, because implements require constant attention.

Then why attempt to operate a tractor in a manner which your experience has proven impractical? It is just as illogical to ride on a tractor in front of the implement and expect to operate the implement from that position as it is to operate the implement from the back of your horse.

Any way you look at it you are working at a disadvantage with the ordinary tractor. To do the best work two operators are required, one on the tractor and one on the implement. In these days of extreme labor shortage this is a tremendous handicap. With the operator on a tractor in front of the implement it is manifestly impossible for him to give the implement attention and make adjustments for varying field conditions without losing time.

Just Like Driving Horses

With the Moline-Universal Tractor you sit on the seat of the implement and have perfect control of both implement and tractor. You are in the best position to observe the work, make adjustments and manipulate both tractor and implement. This holds true regardless of the work being done—plowing, discing, harrowing, planting, cultivating, mowing, harvesting, both grain and corn.

A Time Tried Principle

There is nothing new about this, we simply apply a principle which millions of farmers have demonstrated to be sound. The Moline-Universal gives one man control of greater power than is possible with horses, with the same method of handling and as much versatility. With the Moline-Universal one man can farm more land. It is a six-horse unit—easier to control than one horse and capable of doing the work of from 6 to 8 horses.

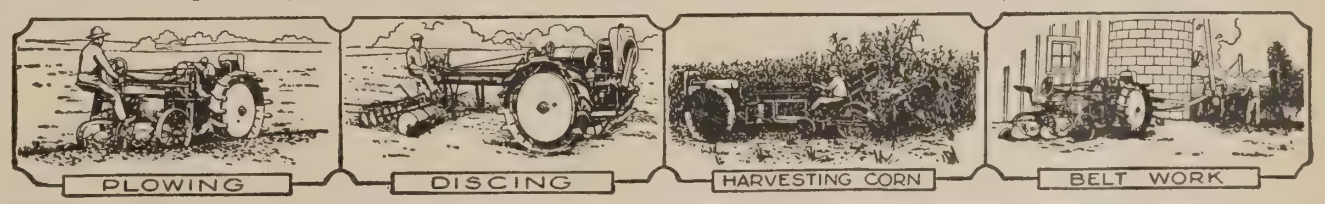
Works Day and Night

The One-Man feature is just one of many advantages the Moline-Universal has over other tractors. It is the only tractor which will do all farm work, *including cultivating.* It is the only tractor regularly equipped with self starter and electric lights. Non-robust labor can operate the Moline-Universal successfully. and it can be worked day and night.

No detail has been overlooked to give the new Moline-Universal Model D Tractor positive reliability. The perfected, overhead-valve 4-cylinder engine develops unusual power, and is economical in operation. It is conservatively rated at 9-18 H. P. Oil is forced to crankshaft bearings under 35 lbs. pressure. Gears are steel cut, drop forged, and heat treated. All shafts are splined. Every working part is easy to get at, and every moving part is enclosed.

Valuable Information for You

Our catalog tells how you can operate your farm with less help and expense by using a Moline-Universal Tractor. A post card will bring the catalog to you.



Since 1865 we have been making farm machinery, and now offer a complete line of both tractor and horse drawn implements. Information on any of the Moline implements listed below will be gladly furnished on request.

Fixing Milk Prices at Condensery

A new plan of fixing prices to producers delivering milk to a condensery has been adopted at the Middleton Condensery of Wisconsin. The plan is simple, easily understandable, and is based on the economic law of a competitive market.

At this condensery, as well as others, there has been controversy over prices to be paid producers. To arbitrate the question the Wisconsin Food Administration appointed a committee consisting of C. E. Lee, Assistant Dairy and Food Commissioner, Professor J. L. Sammis of the College of Agriculture, and W. W. Powers of the Food Administration. This committee made the following recommendations, which were accepted by the producers as a body and by the officers of the condensery:

"The value per pound of butterfat shall be based on the average Chicago market price for the month for 92 scoring butter. A differential of 6 cents shall be used as an additional value of butterfat, as this is the approximate difference between the average price of this grade of butter on the Chicago market for the month of July and the prices paid by several creameries in Wisconsin.

"In addition to the fixed price per pound butterfat, patrons shall be paid for their skimmilk on the basis of the value of corn; namely, each hundred pounds of skimmilk shall be valued at one-half the price of a bushel of corn for the month. To determine the amount of skimmilk that a farmer shall be paid for, 85 per cent of the total amount of milk delivered shall be considered skimmilk.

"The price of corn shall be that given in the report of the Wisconsin Department of Agriculture. The price of butter as given in the report of the Bureau of Markets, Chicago, shall be considered official."

On the basis of this agreement the August price to these producers will be $2.63 per hundred for milk testing 3.9%, the average test of all farmers delivering at the Middleton Condensery. This price is based on the market price of 44 cents for 92 scoring butter on the Chicago market, making the value of butterfat 50 cents per pound after adding the 6 cents differential. The August 1 price of corn according to the State Department of Agriculture was $1.60, thus making 100 lbs. skimmilk worth 80 cents, or 68 cents for the 85 lbs. of skimmilk in every hundred pounds of whole milk.

The following table, giving the test of milk from 3 to 4.5%, shows the price the farmers of Middleton territory would have received for the milk had they accepted the prices offered by the condensery, and the price they will receive for August milk on the basis of 44 cents for 92 scoring butter and corn worth $1.60 per bushel:

Per cent fat	Old price offered	New price offered	Per cent fat	Old price offered	New price offered
3.0	$2.09	$2.18	3.8	$2.33	$2.50
3.1	2.12	2.23	3.9	2.36	2.63
3.2	2.15	2.28	4.0	2.39	2.68
3.3	2.18	2.33	4.1	2.42	2.73
3.4	2.21	2.38	4.2	2.45	2.78
3.5	2.24	2.43	4.3	2.48	2.83
3.6	2.27	2.48	4.5	2.51	2.88
3.7	2.30	2.53	4.5	2.54	2.93

San Francisco Abandons Zone Plan

HOARD'S DAIRYMAN:—After spending several weeks in devising and perfecting a zone system of milk delivery in order to keep down the price of milk, the federal food administration and the representatives of the milk producers and distributors have suddenly announced that all the zone plans have been dropped, and that on September 1, 1918, the price of milk to the consumer will go up from 12 cents to 14 cents a quart. Certified milk has already gone up to 20 cents. Producers will receive 31 cents per gallon instead of 25.

The decision to abandon the zone plan came from the federal food administration and was as much of a surprise to the milk producers and distributors as to the public, every effort having been made to educate the housewife to the proposed zone plan.

The producers have been trying to solve the problem of increased cost of labor, feed, etc.; and the distributors have had to contend with a raise in the price of bottles and an increase in the wages of milk wagon drivers. A raise in the price of milk to the consumer seemed imminent. The zone system, which aimed to do away with duplication of routes, limiting two companies to each zone, was devised to reduce the distributor's costs and thereby keep down the price to the consumer.

Federal Food Administrator Ralph P. Merritt would not discuss the matter but it is believed that while he favors the zone system of delivery, and believes that it should be put into practice, he does not think that it should be brought about by his office, but rather by the enactment of a state law. He pointed out, however, that his organization, being maintained only for the duration of the war, could hardly put through a matter involving such radical and permanent changes as the zone system of milk delivery. That ends the matter for the present, as far as San Francisco is concerned.

We invite you to ride in a Hasslerized Ford

The Hassler Shock Absorber makes a marvelous change in the riding qualities of a Ford. It will give your car the smooth, easy, restful glide you associate only with high priced limousines.

Prove our claims. *Ride* in a Ford equipped with the

For FORD Cars HASSLER PATENTED **Shock Absorber** *For FORD Cars*

We will apply a set for ten days' free trial. At the end of that time we will remove the set without a question and without a cent of cost to you, if you say the word.

There's no obligation to buy tied onto this offer. If you've never ridden on Hasslers, have a set put on, even though now you don't think you want them. We will take the risk because *we know* what Hasslers do to a Ford.

Don't take some other fellow's word for this. Try Hasslers yourself. You will "try anything once,"—there is no risk or trouble in this offer for you.

Besides making your Ford ride like a $2,000 car, Hasslers save tires, gasoline, reduce up-keep one-third, and increase the resale value of your car. *Nearly a million of the Patented Hasslers now in use.*

Write today—now—for Free Trial Blank and name of nearest dealer.

Robert H. Hassler, Inc., 1813 Spruce St., Indianapolis, Ind.

Do You Need Farm Help?

Farm help is scarce, but one way to overcome the scarcity is to make your own time count for more.

The Self-Starting

Remington Typewriter

will *save from one-third to two-thirds of* the time you now spend in pen-writing letters.

The typewriter is becoming as necessary on the farm as any other time and labor-saving machine, and the longer the war lasts the more necessary it will become.

The Remington Typewriter

is easy to learn to operate, and the whole family can use it.

Let us send you our latest booklet, "How the Typewriter Captured the Family". It will place you under no obligation and a postcard with your name and address will bring it to you.

Remington Typewriter Company

Four Cows and a $10,000 Hide!

There's a farmer in Ohio whose name is Peter Small. Peter Small made a mighty big mistake a few years ago. The mistake cost him over $10,000! And all he has to show for it is a bump of experience and a lifeless hide.

Peter Small will never make the same mistake again.

Peter Small did not swallow his loss, and selfishly keep his story to himself. He was big enough to tell the dairy world, so that you and I and others would not lose as he had lost. He took his hide to the National Dairy Show last year and told the story of his mistake.

In the Peter Small exhibit there were five stalls. Four contained cows placidly chewing their cuds. In the fifth there hung the hide of the bull that had sired these cows. He had been slaughtered before Peter Small knew what his daughters could do. That was Peter Small's mistake.

He knows now. He kept a record of his cows after the bull was killed. He found out that they averaged 25,210 pounds of milk and 977.3 pounds of butterfat! And he had killed the bull that had sired them! He had killed for meat a bull that was worth at least $10,000. He had found that out too late.

It was a lesson in cow testing that cost Peter Small $10,000.

But the National Dairy Show gave it to the thousands of wide-awake farmers, who attended the show at Columbus last year, for nothing.

There were many farmers at the show last year who took the lesson of the $10,000 hide to heart, and many a good bull was saved to the dairy world. It may be that there'll be something equally as valuable for you at the show this year. You won't get it unless you come.

Most men learn best by experience. But the school of experience is a long school and a dear school. So, if you can learn at someone's else expense of time and money, you'll be that much ahead, won't you?

The National Dairy Show this year will be brimful of the thousand-dollar experiences of earnest men in the dairy industry. Why should you go over the same costly ground over which they have plodded in order to arrive at the same result? Why should it be necessary for you to make the same costly mistakes that they have made? Why not profit by their experiences?

Why not? October 10 to 19—the dates of the show—will find you with your corn in the silo, and with nothing pressing to keep you on the farm. Take a week off. You'll become the possessor of a veritable gold mine of valuable information, and you'll come back to your farm work with a stock of stored-up energy and enthusiasm that you'll draw on every day next year.

Wisconsin. RUDOLPH KREBS.

New York Butter Market

New York City, August 27, 1918:—The last week in August shows a marked change for the better in the marketing of butter. There has been more active buying during the past few days than at any other time during the month. That is contrary to the usual run of things as the last week in August is looked upon as the worst week of the year. There continues to be, however, a marked scarcity of high grade butter and an accumulation of medium grades, but firsts and seconds are moving much more freely than was anticipated. The hot weather that has prevailed throughout the central west of late still shows its mark in the quality of the butter that is being received. Many makes which ordinarily are graded as strictly fancy are selling as firsts. In addition there is a great shrinkage in quantity of output. With many creameries the shrinkage amounts to fully 50% of their June make. With the passing of the summer months, with their heat and flies, there will undoubtedly be a gradual increase over the amount produced at present.

Demand continues strong for extras and higher scoring butter. Because of that demand there has been an increase in quotation of one cent since last week. Extras which at that time were quoted at 46c have now reached 47c and the market is firm. The increase in price during the week has been gradual. On Thursday of last week there was an increase of one-half cent; on Monday there was a further increase of a quarter cent; and today the 47c quotation was established. There is a strong demand for unsalted butter with a very limited supply. Usually a shortage of unsalted butter is followed by a great influx, hence that condition will probably be improved during the next few days.

Quotations other than those mentioned above are: Higher scoring than extras (93 score or above), 47½@48c; firsts (88 to 91 score), 44½@46½c; and seconds (83 to 87 score), 42 to 44c. Quotations on unsalted butter are at a differential of one to one and a half cent above corresponding grades of salted butter.

W. B. LIVERANCE.

Index Ready

The index for volume 55 of Hoard's Dairyman is ready for distribution. Those desiring this index may secure it for the asking. Address a postal to Hoard's Dairyman, Ft. Atkinson, Wis., and state: "Send me index for volume 55." Sign your name and address plainly. There is no charge for the index.

The government has requested that all publications be saving of paper. This is the reason why we are not mailing the index to each one of our subscribers as has been the custom. We shall, however, send the index to very one desiring it.

Manure from Army Remount Depots

Endeavoring to secure proper utilization of manure from Army Remount Depots, the War Department calls attention to fertilizer topics of timely interest to American farmers.

At prevailing market prices the principal fertilizing elements in a ton of stable manure are now worth about $6.65; yet much of the manure is being sold at camps for less than $2 per ton. Hitherto, only farmers near large cities could secure manure in quantity, but the establishment of Army Remount Depots near the army camps and cantonments now makes large supplies of manure available to districts which hitherto have suffered a serious disadvantage.

The U. S. Food Administration calls attention to the fact that every army camp and cantonment now has a reclamation officer whose duties include not only the salvage of kitchen waste and a great variety of supplies, but also the satisfactory disposition of stable manure. This source of fertilizer should be of interest to farmers both from the standpoint of good farm management and of the nation's future food supply.

Dairying is one of the largest of the agricultural enterprises of this country and the war demands upon it will be in proportion to its importance.

CHANDLER SIX

FAMOUS FOR ITS MARVELOUS MOTOR

You Need the Very Best of Motor Cars

YOU men of the farms who are doing big things, bigger things in these days than ever before, and *getting more* for doing them, must demand the highest efficiency in all your equipment.

Your motor car must be dependable. It must be well built. It must be powerful and full of life, ready to go when you want it to go. It must be economical in its operation and maintenance.

The Chandler, famous for its marvelous motor, now in its sixth year without radical changes but with such constant refinement that the whole mechanism of the chassis approximates perfection, is the type of car you want and need and will get the most out of.

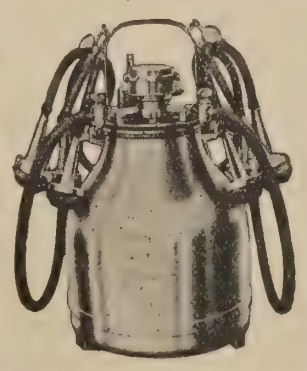
And there is no other car of this type so good at such fair price.

Nearly fifty thousand Chandler owners, many of them progressive and successful farmers, know how great a car this car is.

Let your new car be a Chandler Six. It will be a more than worthwhile addition to your equipment. It will help you to do more for your country and your family. In owning and driving a Chandler you experience the greatest motoring satisfaction.

Choose the Chandler for Your Car

7-Pass. Touring Car, $1795 *4-Pass. Roadster, $1795*
Four-Passenger Dispatch Car, $1875
Convertible Sedan, $2495 *Convertible Coupe, $2395*
All prices f. o. b. Cleveland



There are Chandler dealers in all principal cities and in a thousand towns. Some one of them is in position to show you the newest Chandler models. Write us today for catalog and folder "How Chandler Checks with High Priced Cars"

CHANDLER MOTOR CAR CO., Cleveland, Ohio

The AUTOMATIC CONTROLLER makes the

BURRELL (B-L-K) MILKER

A Distinctly Superior Machine

This patented feature of vital importance to thorough milking is found only on the Burrell. It automatically regulates the vacuum in the teat cup so that it is at all times only what the individual cow needs to milk her quickly and thoroughly. No human control can give the intimate touch required to adjust a machine to the needs of each individual cow.

The Burrell proved a great economy during peace times. Now, because of the increased cost of labor, it is doubly profitable and will pay for itself in a very short time.

Write for our pamphlets which tell all about the modern features of the Burrell which make it the most profitable milker.

EDITORIAL COMMENT

IN reply to a notice of expiration one of our subscribers writes: "Why, God bless you, there is so much good in Hoard's Dairyman that we must have concluded it was a part of the great system of salvation which we understand to be free the world over, from heaven above to all below.

"Sure, send it along."

THERE are sections of country this year that have learned a new lesson concerning the value of the silo. Drouth has injured the corn crop in some areas of the corn belt and the Southwest. If it had not been for the silo little feed would have been gathered from these drouth sections. In Texas some corn was ensiled in July and now other sections farther north are ensiling corn because the drouth cut the crop short.

A BAD fashion seems to have taken possession of many of our friends who write us letters. They use a lead pencil instead of a pen and ink. This, when letters are closely written, is very trying on the eyes, especially old eyes like those of the Senior Editor. The sharp contrast between black ink and the white paper makes all writing, and especially poor writing, a great deal more legible. The pencil may do for newspaper work if clearly written, but it is unbusinesslike to use it in writing private or business letters.

EVERYBODY is interested in the subject of alfalfa winter-killing. In favorable winters it does not matter how the field of alfalfa is treated in the fall,—it will come through in good condition. But since no one can foresee the kind of winter that is before us, it is well to follow the splendid suggestions made by L. F. Graber in Hoard's Dairyman, page 155, concerning the handling of a field of alfalfa.

It should be noted that if it is desirable to keep alfalfa from winter-killing, it should not be pastured or cut later than September 5th.

THERE is a better demand for butter now than a year ago and the price is about four cents higher. The navy and army are requiring large amounts of butter, the navy contract amounting to 500,000 lbs. for September. The allies would use large quantities of butter if they were able to get it. The shipping capacity is short at present. The home demand for butter is very good and June butter is being sold from storage.

The brisk demand for butter from all sources promises a good price for this commodity this winter. There is less butter in cold storage now than one year ago. The condition of the butter market should be encouraging to those who sell their milk or cream to the creamery.

THERE is no danger of any shortage of dairy products in this country if the consumer will buy them at a fair price. It is unfortunate that the prices of dairy products have not advanced in the same proportion as other farm products. There is no reason why the dairy farmer should sell his products relatively cheaper than other farm crops. Milk is still the cheapest animal product on the market.

Those who know the importance of milk to the welfare of the nation should ever bear in mind that dairy products will be adequately supplied if the prices paid for them are in keeping with the prices of other farm products. Dairymen can easily increase the production of their herds by a better system of feeding their cows. At the present time there is a shortage of market milk, but advance the price and there will be an increased supply.

SINCE the outbreak of the war we have had those interested in the welfare of dairying claim that dairymen were selling their cows and going out of the dairy business. There are instances where dairymen have done this, but we can gather no information which leads us to believe this practice is at all general. The present demand for cattle and the high prices being paid for them for dairy purposes do not indicate many dairymen are sacrificing their cows to the butcher.

Recently a buyer came to Wisconsin for dairy cows and paid $110 for very common grade Guernsey heifers weighing less than 900 lbs. and offered as high as $200 for good grade Guernseys. He could not buy the best grades for $200 apiece.

We believe as long as the prices for dairy cows for dairy purposes are higher than for beef purposes, there is no danger of dairy cows being sacrificed to the butcher. The high prices of feed and the shortage of labor may lead to selling more of the poor dairy cows. This step would improve dairy conditions.

WHEAT AND PHOSPHORIC ACID

One of the essential elements of plant food is phosphorus. Wheat particularly needs it. Soils which have been cropped for many years are very likely to be deficient in available phosphorus. The government is asking for a larger acreage of wheat for 1919 than it did for 1918. One of the most effective and sure ways of securing a larger yield of wheat is through the application of phosphoric acid. This compound contains phosphorus in a form that the plants can use it the first year. It is in, what is termed, the available form.

The price of phosphoric fertilizers has advanced the past few years, but upon this point Chas. J. Jones, county agent of Indiana, says:

"In the year 1914 it took 22.7 bus. of wheat selling for 75c per bushel to pay for one ton of 16 per cent phosphate costing $17. In the year 1918 it will take 13½ bushels of wheat selling for $2 per bushel to pay for one ton of 16 per cent acid phosphate costing $27. Fertilizer is far cheaper today in proportion to the value of wheat than before and no man should consider an application of less than 200 lbs. per acre and he will find if he makes a 300-lb. application that his crop will go into the winter in better shape, will be more resistant to insect pests and disease, and will make a bigger yield and net considerably more profits than otherwise."

It may be said that for spring wheat this fertilizer should be applied just before seeding.

TRACTOR AND FOOD

One of the duties of this country is to produce more food. The tractor this year helped to lighten the heavy burdens of the farmer and to increase his service. The great advantage of the tractor, on the average farm, is that it helps admirably in doing heavy work rapidly. In the spring horses are soft and cannot be forced to do a big day's work without danger of permanent injury. It is highly desirable that crops be planted in season and this is not easy to do unless extra horses are kept for unusual conditions.

Where a tractor is owned it can be worked early and late. If necessary, plans can be made so that two men can keep it in the field 15 to 18 hours a day. The extra work which can be done with the tractor and the need of doing spring's work on time makes the tractor highly desirable. Most farmers keep more horses than is needed for steady work, because every farmer knows there are times in rush seasons when he must have extra power Those owning a tractor find they can get along with fewer horses, because it will stand crowding and works as well on a hot day as on any other.

It will not only save horses in this respect, but it prevents the horses from being drilled down to a low physical condition. In being able to carry extra loads when most needed it also saves man power, making it possible for a man to do more.

Getting crops in the ground on time invariably means a larger yield. We used a tractor on Hoard's Dairyman Farm this year and found it very satisfactory for getting work done quickly and it saved our horses and mules. In these times of shortage of farm labor farmers may well consider the use of the tractor to help them, especially through the rush seasons. It should be remembered that the engine may be used for threshing, filling silos, shredding corn, and other belt purposes.

FUTURE OF DAIRYING

In the past year we have mentioned the factors which we consider will provide a bright future for dairying. The times are trying the souls of all men, and especially those owning large herds of cows. The shortage of labor and the increased burdens of the farmer make his task unusually hard. But there is a silver lining to every cloud. Carl Vrooman, assistant secretary of agriculture, has brought a cheerful message to the dairymen of America, even though it points a dark picture of Europe. He says:

"The dairy herds of the old world are depleted to an appalling degree. There is not a country in Europe where the people have enough dairy products, and this process of depletion is going on every day, and every week, and every month, and will continue to go on so long as this horrible war lasts. When this war is finished we will find the world with a demand for dairy products two-fold, four-fold, ten-fold greater than the supply. Europe will come to us with outstretched hands—every country in Europe—and say to us: 'We must have milk; give us canned milk; give us dry milk; give us butter; give us cheese; give us dairy cattle; give us animals to build up our dairy herds again.' Unless America has stimulated the production of dairy products, and increased our supply of dairy animals far beyond anything in the past, we shall be utterly unable to supply this demand. We will supply as much of it as we can, because they are going to be willing to pay practically any reasonable price for our live stock; and we will supply so much of it that our own resources will be exhausted. Then this country will be without sufficient dairy products."

Our dairymen everywhere should lay plans now to meet the demand for dairy products and cattle that is bound to come after the war.

J. H. McVay, a soldier "over there", writes us his opinion about dairymen raising cows:

"Before I left home, I heard farmers say: 'Oh I'm going to sell my cows—feed is too high and my income too small, etc.' If these same farmers could only look ahead and realize what their herd is going to be worth as soon as we knock the war ideas out of Kaiser Bill, they would change their tune and would scratch and pinch to increase the herd.

"There is going to be an unheard of demand for *good* cows and the fellow who is foresighted enough to raise calves now is going to reap his harvest as soon as peace is declared.

"You see I haven't read a copy of Hoard's Dairyman for some time, so don't know what you are doing along these lines. But—if you will permit a suggestion from a soldier from Wisconsin—tell the cow man to prepare now for what is coming very soon,—peace and a call for good cows and more cows."

SWISS CHEESE AND QUALITY

For years Wisconsin has been making a fine grade of Swiss cheese. The best grade has been equal to the imported Swiss which is sought by those fond of fine Swiss cheese. Because of its reputation, imported Swiss has invariably sold for higher prices than domestic Swiss. Up to the time when the pure food laws went into effect much of our domestic Swiss was sold for imported. This could not have been done successfully unless it was of high quality.

Dr. H. L. Russell, who has been serving for the past year in the United States Food Administration, warns the Swiss cheese industry regarding the present practices of selling new cheese. He in part says:

"Since the discontinuance of the importation of Swiss or Emmenthaler cheese from Switzerland into the United States by reason of the embargo on shipping, an exceedingly keen demand has developed for the domestic product which is so largely made in Southwestern Wisconsin. The result has been that the price of round or tub Swiss cheese has advanced so rapidly within the last year or two that its wholesale price now is more than twice what it normally was under pre-war conditions. Under these exceedingly active market conditions a very keen competition has developed among the buyers with the result that the cheese is taken from the curing shelves at a relatively earlier date than formerly.

"The buyers now in their scramble for the product on an advancing market are taking the uncured cheese and when this uncured cheese is placed in cold storage, or not cared for as is possible in the factory, the result is that the quality of the cheese is to a greater or less degree adversely influenced.

"We may rest assured in Wisconsin that after the close of the war when commercial relations are resumed with Switzerland, that country will use every effort to regain its trade here in America by the shipment of high quality product and if the quality of our domestic Swiss cheese declines by virtue of this injurious trade practice of buying closer to the press, we will be put in a disadvantageous position to compete with the better imported type."

In other words, now is the time for the Swiss cheese industry of the United States to establish a reputation for its product. This can be done by placing on the market a high quality of Swiss cheese. Selling cheese before its grade can be determined and before it is properly cured will not secure and hold the best market for our domestic Swiss cheese.

Tail Holding Device

In your issue for July 12th you published a series f pictures of a "Holland Certified Dairy". I otice in one of these views the cows are shown ith some kind of a tail holding device. I have pent a good deal of time on the matter of control- ng the tails and would like to have the details of ne arrangement shown in the photo explained. understand most of the animals in the better class f stables in Holland are thus equipped so it must e a practical sort of device.

Amherst, Mass. R. H. W.

With the exception of a few dairymen, we find in Holland the cow's tail is tied up with a string dur- ng stable time, that is, from October to May, a eriod in which the cow never leaves the stable. he purpose of this holding up of the tail is to revent the cow from soiling herself by switch- ng with the tail in the gutter. Behind and above he cows is stretched a wire with iron rings and o the iron ring is attached a string at the end of hich is a small leather strap. In the tail itself special kind of straw is twisted to a knot and bove this the leather strap is attached. The tring is made long enough not to bother the cow hile she lies down. The cow's tail is, moreover, hortened a little during stabling time, the comb- ngs being carefully saved for making strong opes, filling of harnesses, etc. Much care is taken f the tails as these are considered an ornament f the animal, and it cannot be denied that the egular washing and combing of the tails makes a ood look in the barn.

In summer time the cow's tail is left at liberty, f course; first, because they are in the pasture and econdly, because most of the Holland dairymen onsider their animals rather as family members nd would not allow any torture purposely done to he animals. They endure switching of the tail uring milking time with patience.

However, some sanitary dairies tie the tails dur- ng milking time but only for the sake of prevent- ng dust falling into the pail by the switching and o not disturb the milker. These dairies use a imple tailholder of aluminum or tin, resembling a air of long handled pincers. The end is provided vith a removable buckling, the top part is com- osed of two small blades with points on the inside urface and between these blades part of the cow's ail hairs are pinched. As it is a custom in Hol- and that during summer time the cows are milked n the pasture, never in the stable, some dairy- nen tie the hind legs with a rope and tie in that nanner at the same time the tail between the eg and the rope. On our farm we have never and vill never practice this method. The cows are nilked absolutely free in the pasture or corral.

Colorado. L. DIJKSTRA.

Winter Wheat Queries

We have two acres of land in barley now and as oon as barley is off will plow it and put in winter vheat. What variety would you say for this lo- ality? Could we use a fertilizer to good advan- age? We intend to use this land for pasture and vill seed it down in the spring. If we could use a ertilizer, tell us how much per acre and what kind. We thought we could put the fertilizer in the grass eeder attachment or mix it with grain. Tell us vhich is the best way to apply it. How many pecks per acre do you think best with a drill? Give us ny information you can in regard to growing vheat as soon as you can.

Through reading the Hoard's Dairyman we've ot two cows in the Register of Merit this year, one aving 2 calves in the year and the other having er second calf. Good for beginners, we say.

Edgar, Wis. H. BROS.

Winter wheat does well in Marathon County. his is especially true of the pedigreed winter va- ieties that can be secured through the growers of he Wisconsin Experiment Association. We would uggest the use of Wisconsin Pedigree 2 or 408. he land should be plowed as early as possible after he crop of barley is taken off. The land for fall rops should have sufficient time to settle before utting on the crop. By plowing early the ground ettles down to its natural condition, thus getting he proper air and moisture circulation. This will nsure rapid germination. Where fall grains are put n to ground that has been recently plowed it re- uires two or three weeks occasionally before the rains will sprout and grow properly.

No commercial fertilizer will give the excellent eturns that barnyard manure will. We are en- ouraging the use of barnyard manure whenever it an be secured. A topdressing of barnyard ma- ure after plowing the land would give excellent esults for wheat. This manure could either be isked in, or, if applied with a manure spreader nd it was well rotted, could be left on the surface fter seeding. Whether applied before seeding or fter seeding would depend upon the coarseness of the manure. It will be preferable to leave it on top if the manure is well rotted, sowing the wheat first. If barnyard manure cannot be obtained the wheat usually would be materially helped by using 200 lbs. of acid phosphate per acre. This can be put on immediately after the land is prepared for the grain. Do not think it advisable to use grass seeder attachment for putting on commercial fertilizer. For small acreages this can readily be sown by hand if no fertilizer machine is upon the farm.

The wheat, if put in with drill, should be sown at the rate of 1½ bushels per acre. If broadcast seeder is used put in one peck extra.

If this particular tract of land is to be left for permanent pasture our advice would be to sow pedigreed rye instead of wheat. Put in the rye the first week in September, and sow one bushel and 3 pecks per acre. Rye makes an excellent fall pasture for all classes of live stock. If snow is not deep stock can be pastured well down into the winter. In early spring the grass mixture can be sown on top of the rye crop. If sown before the frost is out of the ground no dragging will be necessary. However, a light dragging will not materially injure rye. We find rye one of the most desirable crops to sow grass seeding with. For permanent pasture we would recommend 1 quart alsike clover, 2 quarts medium red clover, 3 quarts timothy, and from 4 to 6 pounds of Kentucky blue grass seed per acre. The rye field can again be pastured in the spring down to the middle of May. The stock should then be taken from the field and the rye will ripen and can be harvested in the usual way. As soon as the rye is taken from the field the grass seeding will have made such an advance that it can be pastured lightly during the remainder of the summer and fall. R. A. Moore.

Wisconsin College of Agriculture.

Sorghum Bagasse Silage

There is a sorghum and syrup factory being built within a short distance of me and they are building a silo to put the crushed cane in after having the sugar removed. What data have you as to its probable feeding value? Would it be practical to buy it for 6-month-old calves and 2-year-old heifers?

Ottawa, Kans. R. G. B.

Sugar cane or bagasse may be ensiled and will make a fair grade of silage. The cane tops and the leaves, which are removed before running the stalks through the mill, will also make good silage if run through the usual silage cutter. This material should not be wasted, particularly when we consider the high price of other feeds and the danger of shortage of feed.

A year ago, Professor C. E. Mauldin of the Louisiana Experiment Station sent us the following discussion of the use of bagasse:

"During the winter of 1916—17 at the Iberia Live Stock Experiment Farm, four lots of native steers were fed on sugar cane bagasse with cottonseed meal, and cottonseed meal and molasses. The results, however, were not encouraging as the steers did not consume sufficient bagasse to make satisfactory gains. The average composition on the dry basis of bagasse from four analyses was as follows: Crude protein, 2.31; fat, 1.2; carbohydrates, 46.66; crude fibre, 45.24; water 1.84; ash, 2.45.

"The practical feeders who have used cane top silage report profitable returns. Cane top silage has been fed at the Iberia Live Stock Experiment Farm in comparison with corn; corn and soy beans; corn and sorghum; corn, sorghum, soy beans, and cowpeas; Japanese cane; and whole sugar cane silages with satisfactory results when supplemented with cottonseed meal.

"During the past winter at this station silage made from frost bitten cane tops showed a profit of $9.00 per ton when fed to native steers with cottonseed meal and molasses, molasses being used only as an appetizer. The value of the tops in this instance for silage was almost twice that of cane for sugar—and there are four million tons of cane tops wasted in the sugar cane producing district of Louisiana annually. The dairyman who has free tops available will find it very profitable to ensile them for his producing cows, as well as his growing stock. Cowpeas or soy beans mixed with the tops will add to the feeding value of the silage."

This somewhat discouraging report brought out the following expression of opinion from one of our subscribers located in the state of Georgia:

"My experience with feeding sugar cane bagasse has been most favorable, warranting the conservation of this heretofore waste in the South.

"As I understand, the Louisiana Live Stock Experiment Farm in 1916—17 did not handle the material the way that appeals to me as the best. As soon as the juice of the cane is expressed I shred the remaining cane stalks and all the tops and run them promptly in a silo. A load of dry cornstalks direct from the shocks in the field is shredded and alternated with the cane, i. e., a load of bagasse and a load of cornstalks. Sufficient water is sprayed on the shredded material, as it is blown into the silo, to dampen the whole to proper wetness.

"Dairy cows eat this sugar cane bagasse greedily when mixed, as I feed it, with peanut meal. A better flavored milk I have never tasted than that produced from the above described feeds.

"It is not to stop spending money for comforts and conveniences that the best friends of southern agriculture desire, but senseless waste should be avoided by all true economists."

Other readers who have had experience with sugar cane bagasse will confer a favor by writing us of their opinion of this feed and how they handle it.

Salt—Poison from Nightshade

Please advise me if young heifers one or two years old, living on blue grass and timber pasture, will die if not provided with salt. Will the 50-lb. pressed blocks provide sufficient salt?

Will they eat nightshade? If so, will it poison them, and cause death?

Sterling, Ill. S. K. G.

Animals which are not supplied with salt may not show any immediate bad effects. However, their bodies are constantly being run down in vitality and after a period of time they suffer very greatly and will perhaps die unless salt is supplied in some form.

There is considerable variation in the mineral content of vegetation from different soils. It is possible that animals on some particular pasture might survive a good while without showing ill effects from the lack of salt. However, salt is so cheap that it is out of reason to experiment on this point. The best practice is to keep a liberal supply before animals on pasture at all times. Cattle are altogether too valuable at this time to take any chances when so slight a cost will make the ration safe on this point.

Rock salt or pressed salt in blocks is satisfactory. The waste will be very much lessened if some protection can be provided for the salt so that rains do not dissolve and wash away a large part of it.

There are many different kinds of nightshade. A few of them are poisonous but the great per cent of them are not poisonous. Normal animals will not eat plants of the nightshade family if they are fed liberally. If a part of a pasture has a great deal of nightshade, it would be wise to take special pains to eradicate it. However, if a pasture supplies abundant feed or if it is supplemented liberally with other feeds, there is relatively little danger that cattle will be poisoned from eating nightshade.

Potatoes to Sows

We have two young bred sows and were recently advised by a rancher to not feed old potatoes that have sprouted. We have a bunch of old potatoes and which we had intended feeding these sows, but if they would have any ill effects in any way whatever, would not think of feeding them.

If you will kindly give me your views on this above matter, I will much appreciate the favor.

Denver, Colo. W. A. W.

Potatoes do not contain suitable food nutrients that they may constitute the entire ration for hogs. Potatoes should be fed in conjunction with concentrates and should always be cooked before feeding to hogs.

At the Wisconsin Experiment Station potatoes were cooked in an open kettle with a small amount of water and with corn meal added so that a thick mush was formed. This feed mixture was compared with results secured when hogs were fed corn meal soaked in water. Seven hundred and eighty-six pounds of potatoes made a saving of 178 pounds of corn, and 442 pounds of potatoes were made to take the place of 100 lbs. of corn meal.

In some experiments which were carried on across the sea it was found that on the average it took about 400 pounds of potatoes to replace 100 pounds of mixed grain. In a few experiments the quantity of potatoes necessary to replace 100 pounds of mixed grain has run down as low as 340 pounds.

As long as potatoes are mixed with concentrates and no attempt is made to supply the entire ration with potatoes, and so long as the potatoes are cooked before feeding, we recommend that good returns may be secured from feeding potatoes to hogs.

Keep Your Liberty Bonds

HOLD to that bond. You invested to help send the boys across. They are over now, at grips with the German monster. You expect them to hold on—hold on till the last vestige of autocracy is crushed out of him. Then you, too, must hold on—must keep your enlisted dollars invested on the fighting line.

It isn't the hooray of a campaign that wins a war. It's the will to hang on, to make sacrifice today, that tomorrow may bring victory.

And your investment. Those bonds are the safest investment you ever made. Don't be lured into exchanging them for the "securities" of some suave get-rich-quick operator. Big returns may be promised but the bigger the promised returns the bigger the risk.

If you have to have money, take your bond to any bank and use it as collateral for a loan. There is no security the banker would rather have—nothing on which he will lend more willingly.

Don't use bonds to buy merchandise. The average merchant, accepting your bond in trade, sells them immediately, thus tending to lower their market price and taking away from the buyer of your bond the ability to lend a corresponding amount of money to his Government. Liberty Bonds are meant to help your country at War; are meant for investment and to provide an incentive for saving and a provision for the rainy day.

Hold fast to your Liberty Bonds. Hold fast for the sake of the boys "Over There." Hold fast because it is good business.

Children Tell How to Banish Cattle Fever Tick

How children are interested in the campaign to banish the cattle fever tick from the United States was shown in a recent prize essay contest among the school children in Bowie County, Texas. Interest was stimulated by prizes offered by the Texarkana Chamber of Commerce, members of which are strong advocates of tick eradication and appreciate the need of lining up all ages in support of the campaign. Similar essay contests are being planned in a number of other communities where tick eradication is in progress.

Of the large number of essays submitted in the Bowie County contest, that written by Miss Mabel Hatcher was judged to be the best and the writer received the first prize. Her essay follows:

Tick Eradication

"We have a pest called the cattle fever tick. The exact origin of this pest is not known. It is, however, quite probable that they were introduced into our country with the importations of cattle by the Spaniards during the early colonization of Mexico and the Southern States. Since then they have spread rapidly. At first the fully developed female lays from 1,500 to 3,000 eggs. These eggs are of a waxy brown in appearance. The time required for the development of these seed ticks varies from 13 days to 6 weeks. Much depends on the moisture, temperature, and soil.

"The seed ticks are very small and six-legged parasites and resemble the egg in color. They are about three-sixteenths of an inch in size. These crawl about in large numbers, forming an ambush on grass blades, shrubs, or other convenient plants, and here await the approach of a horse or cow. After fastening themselves to the cow they draw the blood from her. After living thus for one week they shed their covering. Then we have an eight-legged tick. The female tick is much larger than the male. The male after satisfying his greedy appetite falls off. The egg-laying tick, who had by this time turned an olive green, drops off also to lay her eggs in the grass, and thus starts a new tick family. These ticks, having completed their short but harmful lives soon die.

"Perhaps we have never thought of the harm and continual loss they cause our country year after year. Yes; they are very harmful indeed, but only to cattle. They, the cattle, are infected with the terrible tick fever by being bitten by the fever tick, and death is certain to follow. Therefore you lose a fine cow when you could have prevented it. You wish to sell the hide after you lose the cow, but find that it too has been damaged; therefore, because of the roughness of the hide, you do not get as high a price as you otherwise would have gotten.

"This loss is preventable. Why not prevent it? The cost is not great either. Thanks to the Department of Agriculture we now have a medicine which will kill all ticks which are wet with it. The best and easiest way to dip the tick is to dig a long, deep trench—line this with concrete and cement so as to hold water. This is a dipping vat. Fill this with water and put in the arsenic and other necessary medicine. The cattle are then made to swim through this arsenical dipping solution. This kills the tick without injury to the cattle.

"The cattle are driven back to the pasture and there become traps for other ticks. In two weeks longer they are again dipped. This dipping is kept up all spring and summer. The ticks are then destroyed. When your country is tick free do not allow any ticky cattle to be shipped into your tick-free country. Tick eradication is just one of the many ways in which the farmers can show their patriotism and serve their country well. If you can't carry a gun you can at least eradicate the tick and thus aid in the production of meat for our boys who are fighting so gallantly in the trenches for us and their country."—U. S. Weekly News Letter.

Cows in a Potato County

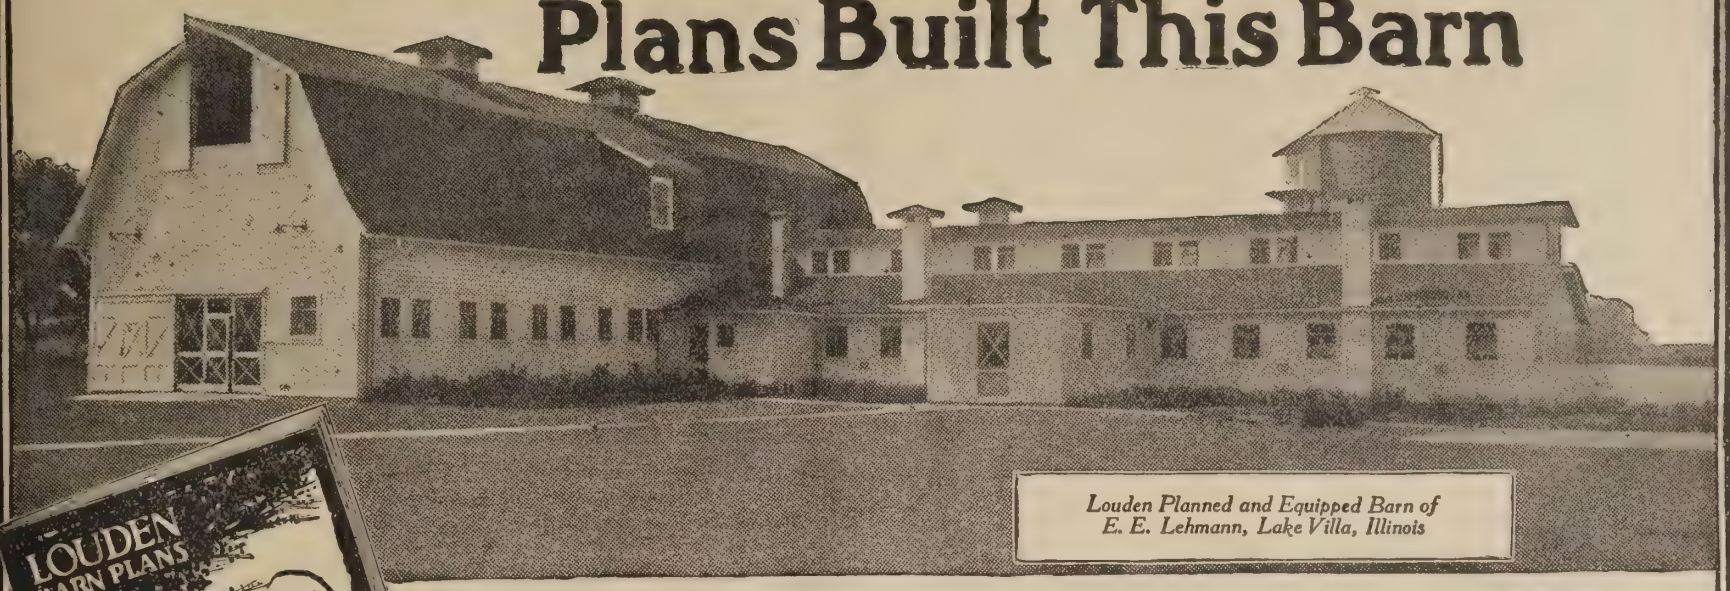
The Stockton Boys' and Girls' Calf Club, a section of the Portage County, Wisconsin, Junior Calf Club, held a live stock institute on August 8, that proved to be a notable success. The young people exhibited their live stock and the neighbors brought in their pure-bred live stock, a little community fair being held that was a credit to the neighborhood and a source of education to the entire community.

On farm after farm in Portage County can be seen the old hop houses once used for the curing and drying of hops. Now they are invariably used for housing a silo. Silos are springing up rapidly in Portage County. This has long been known as one of the big potato counties of the state. The pure-bred sire is also making a good showing. The well bred dairy cattle and the numerous silos are pretty much responsible for the fine looking crops to be seen.

This splendid meeting originated at a business meeting of the Stockton Calf Club, an organization of eight boys and girls who are expert calf feeders and are very much interested in club work. They planned the meeting as a place to exhibit their calves. Last winter with the help of their leader they each secured a good heifer calf. A number of them bought their calves from the best dairy section of the state. They have kept a very businesslike record of the cost of feed, labor, and the gain of their calves. They have been holding club meetings at which such practical problems as proper rations, proper feeding, care, diseases, treatment for lice, etc., were discussed in a very practical way. These boys and girls are going right after the dairy cattle business, and in a very practical way. They are sure of two things. It pays to feed and care for a well bred dairy calf, and it does not pay to raise a dairy calf that is not well bred.

J. M. COYNER, County Agent.

Dysentery



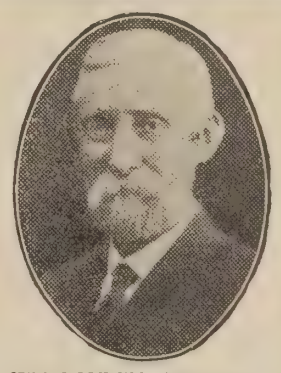
I have a Jersey bull 15 months old. For the past few months he has been bothered with looseness of the bowels, seems strong, eats well, and is in fairly good flesh, but is dobbed up around the vent all the time. Can you prescribe something to stop it? He pays little, if any, attention to a cow when in season. Would the looseness have anything to do with this?

Decatur, Mich. W. S. F.

It is quite likely that the young bull is afflicted with chronic bacterial dysentery (Johne's disease) which is contagious and incurable. The disease might be definitely diagnosed by a microscopic examination of scrapings of membrane from the rectum. Take the matter up with Veterinary Department of the State Agricultural Experiment Station. Meanwhile isolate the bull and cleanse, disinfect, and whitewash the place he has occupied. There are many other causes of looseness of the bowels, but it is well to be on guard lest Johne's disease be present. Give the bull boiled milk freely two or three times a day and add cottonseed meal to his ration. If looseness persists and Johne's disease is not diagnosed, give a full dose of physic under veterinary direction and follow with doses of triple sulphocarbolate tablets which the doctor will prescribe.

LOUDEN

Plans Built This Barn



Louden Planned and Equipped Barn of E. E. Lehmann, Lake Villa, Illinois

Help That You Will Appreciate
If You Expect to Build or Remodel a Barn

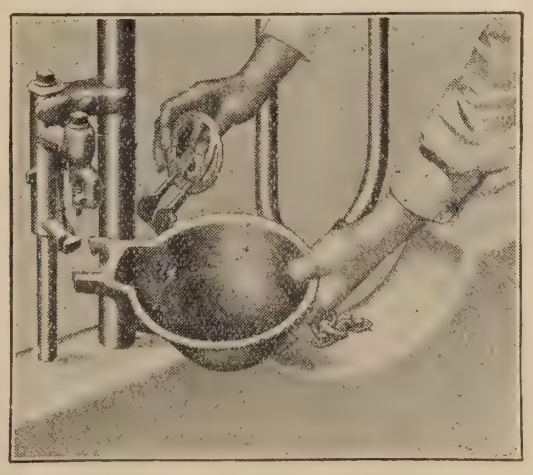
Louden Planned Barns represent the most advanced type of barn for convenience, economy and profitable operation. They embody ideas in construction, arrangement and equipment which are proven by practical experience to meet every requirement for maximum efficiency.

WM. LOUDEN, *Originator of Modern Barn Equipment and Recognized Leading Authority on All Barn Building Problems.*

Louden Expert Barn Plan Service

does away with guess work in planning your barn—gives you a barn which will exactly meet your particular needs for all time—the most for your money in housing and storing capacity, in proper lighting, ventilation and drainage, in labor-saving conveniences, in health and comfort for your live stock.

We Make No Charge for carefully considered advice and preliminary plans, made to suit your particular needs. Give us some idea of what you have in mind, state the number and kind of stock you wish to care for, and our experts will work out a plan that will save you time, worry and money—without cost or obligation on your part.



Get This Book Before You Build

Louden Barn Plans is written especially for farmers and dairymen who contemplate building or remodeling barns. It is not a catalog. Its 112 pages are devoted entirely to barn building—a complete, simple, practical guide, written in a manner which any one can understand, with numerous illustrations—printed in type large enough to be easily read. Here is a partial list of contents:

74 illustrations of barns of all styles and sizes and other farm buildings, with estimated cost and full description of each, including floor plans.
Concrete work—foundation, floor materials necessary, cost.
Locating floor levels for proper drainage.
Superstructure with details of framing.
Braced rafter construction for basement barns.
Construction of plank trusses.
Best form of roof for maximum loft capacity.
Details of sliding doors and ventilating windows.
Ventilating Systems described with tables showing size of vents.
Tables of size and strength of materials.
Approximate capacity of round silos.
Modern sanitary bank barns.

This book is of inestimable value to barn builders. Sent postpaid, without charge or any obligation on your part.

Write for it at once. It will help you to decide what kind of barn is best suited to your needs.

Improved Louden Sanitary Water Bowl

Supplying cows daily with plenty of fresh, pure, even-tempered water is a man's job and a big one—absolutely necessary to quantity and quality milk production. Milk is 87% water; the average cow needs ten gallons of good water per day to keep up her milk yield.

Louden Improved Water Bowls cut out fully 90% of the labor. Waters cows regularly, automatically, whenever they need it—without attention.

Only Bowl That Can Be Easily Sterilized

The Louden Bowl is firmly held in place, but can be removed and reset in less than a minute's time. By simply raising the nose piece into a vertical position, it can be lifted from its fastening. Has no set screws to rust, no supporting lever necessary, no collar connection, or other trouble-making fittings that require adjustment.

The Louden Bowl represents the most definite improvement for indoor watering that has ever been offered you.

Any ordinary help can install the Louden Bowl in any barn.

Let us send you Illustrated Literature giving full information on this great labor saver.

You Need Louden Labor-Saving Barn Equipment

Louden Labor-Saving Barn Equipment is a necessity in the dairy barn. Saves man-power—enables you to clean the barn, feed and water the stock and do other chores with less help, in less time. Distinctive in simplicity, strength, convenience, safety and comfort for live stock. Easily installed in any barn—as profitable in the smallest as in the largest barns.

Write for Our 224-Page Illustrated Catalog

We will be pleased to send you our 224-page general catalog which shows the full Louden Line, including Stalls and Stanchions, Litter and Feed Carriers, Animal Pens of all kinds, Water Bowls, Hay Unloading Tools, Cupolas, Ventilators, Barn and Garage Door Hangers, Horse Barn Fittings, Power Hoists, Manger Divisions—"Everything for the Barn." Sent postpaid, no charge or obligation. The coupon or a post card brings it to you.
